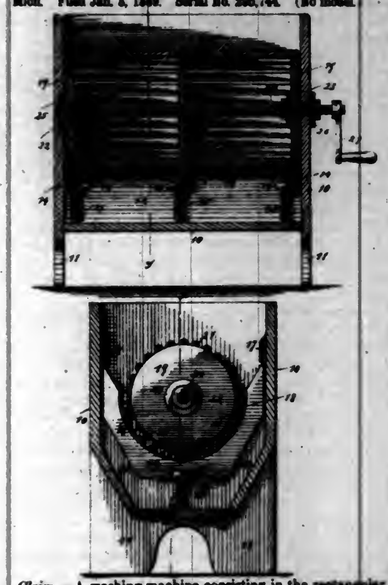
THEOPHILUS V. HUGHES, Holywell, North Wales, and CHARLES E. CHAMBERS, South Kensington, County of Middlesex, England. Filed Aug. 30, 1888. Serial No. 283,190. (No model.)

Claim.—The herein-described process of manufacturing dense homogeneous, resilient, and hair-like carbon filaments for glow-lamps, which process consists in causing a gaseous carbon compound (capable of yielding carbon when decomposed by heat) to undergo decomposition in a heated retort, the gases while undergoing the decomposition having such motions impressed upon them that vertical or gyrating currents of gas are set up through the atmosphere of the retort, from which currents the carbon resulting from the decomposition segregates directly in the form of filaments, as hereinbefore described.

405,481. WATER-HEATER.

CHARLES G. JEWETT, Howell, Mich. Filed Feb. 25, 1889. Serial No. 301,132. (No model.)

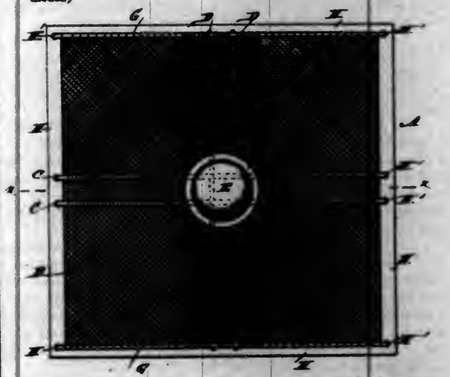


Claim.—1. In a water-heater, the combination of a lower water-ring, an upper water-chamber provided with a depending water-leg dividing the combustion-chamber transversely, and connections between the water-ring and the top and bottom of said water-leg, substantially as described.

2. In a water-heater, the combination of a lower water-ring, an upper chamber provided with a depending central water-leg dividing the combustion-chamber in two, connections between the top and bottom of said water-leg and the water-ring, direct connections between the water-ring and the water-chamber at the edge, and the heating-tubes *f*, attached to said water-leg, substantially as described.

3. In a water-heater, the combination of a lower water-ring, an upper water-chamber provided with a depending water-leg having inclined steps, inclined heating-tubes engaged in suitable screw-threaded apertures therein, and the pipes *h*, *i*, and E, connecting the water-ring with the water-leg and water-chamber, substantially as and for the purpose described.

405,482. WASHING-MACHINE.



HANS JOHNSEN, Hermansen, Mich. Filed Jan. 8, 1889. Serial No. 295,744. (No model.)

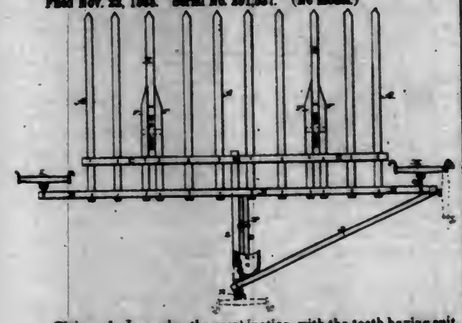
Claim.—A washing-machine consisting in the rectangular tub or box 10, having a dish-shaped bottom 12, the transverse spaced blocks 14, shaped to conform to said bottom and having central transverse projections 16 on their lower sides, the springs 15, on which said projections rest, the semicircular sheet 18 of corrugated zinc extending from end to end of the box and secured to the concave upper faces of said blocks, the rotary rubber formed of centrally-apertured disks 19 20, and spaced bars 21, secured thereto, the shaft 22, the collars 23, and bearings in the ends of box for said shaft, substantially as set forth.

405,483. DIAPHRAGM FOR ACOUSTIC TELEPHONES.

HENRY P. JOHN, New York, N. Y. Filed Apr. 4, 1888. Serial No. 269,534. (No model.)

Claim.—1. As a new article of manufacture, a diaphragm for acoustic telephones, consisting of a piece of fabric having strands or cables of greater strength than the ordinary woof and weft threads of the fabric interwoven in it, the said strands or cables intersecting each other at the center to form a support for the button and line-wire, substantially as set forth.

2. As a new article of manufacture, a diaphragm for acoustic telephones, consisting of a piece of silk and woolen fabric having strands or cables of greater strength than the ordinary warp and weft threads of the fabric interwoven in it, the said strands or cables intersecting each other at the center to form a support for the button and line-wire, as set forth.



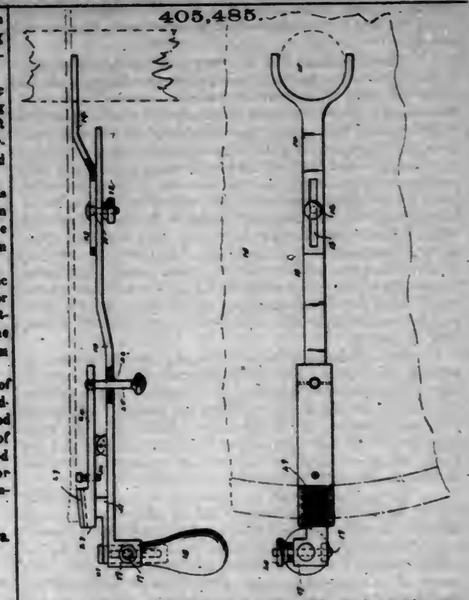
3. A piece of fabric woven of silk and woolen threads, and rods or cables crossing each other and interwoven in the said fabric, in combination with a button secured in the middle of the fabric at the intersection of the crossing rods or cables, and a wire extending from the said button, substantially as shown and described.

4. The combination, with a rectangular frame, of a piece of fabric woven of silk and woolen threads, rods or cables crossing each other and interwoven in the said fabric and also secured to the said rectangular frame, a button secured in the middle of the said fabric at the intersection of the crossing rods or cables, and a wire extending from the said button, substantially as shown and described.

5. The combination, with a frame, of a piece of fabric woven of silk and woolen threads, rods or cables crossing each other in the middle of the fabric and interwoven in the said fabric, being also fastened by their ends to the said frame, rods secured to the opposite ends of the fabric and fastened to the said rectangular frame, a button secured in the middle of the fabric at the intersection of the crossing rods or cables, and a wire leading from the back of the said button, substantially as shown and described.

405,484. HORSE HAY-RAKE.

OREN H. KING, Houghton, Iowa. Filed Nov. 22, 1888. Serial No. 291,857. (No model.)



Claim.—1. In a rake, the combination, with the teeth having suitable transverse beams rigidly connecting their rear ends and supporting-wheels journaled in the rake-frame in advance of the transverse beams, of a rearwardly-extending beam having its front end loosely connected to the frame in the rear of the wheels, a supporting-wheel at its rear end, and an operating-bar pivoted upon the said beam having a seat upon its rear end and its front end engaging the rake-frame back of the supporting-wheels, whereby the rake automatically balances itself and the points of the teeth are forced down by the weight of the driver, substantially as shown and described.

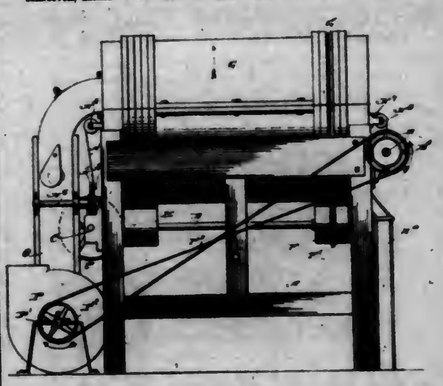
2. The combination, with the hay-rake provided with the stringer B, which has its ends to project beyond the sides of the teeth, of the diagonal brace J, a seat-beam L, with the loop, and the singletree H, whereby the draft at one end of the stringer B can be transferred from that end of the stringer B to and along the diagonal brace J, substantially as set forth.

405,485. SAW-DRESSING DEVICE.

WALTER KIRKPATRICK, Marinette, Wis. Filed Mar. 21, 1888. Serial No. 304,108. (No model.)

Claim.—1. An implement for side-dressing saw-teeth, comprising a body having a handle at one end, a guide fork or block detachably secured to the opposite end, and a lever fulcrumed upon the inner face of the body provided with a guide-screw and a detachable file, all combined for operation substantially as shown and described.

2. In an implement for side-dressing the teeth of saws, the combination, with a body provided with a handle at the outer extremity, of an arbor fork or block adjustably secured to the inner side of the said body near the inner end, a lever fulcrumed upon the said inner side of the body forward of the center, having an undercut recess in the outer extremity, a file detachably held in the said undercut recess, and a guide-screw adapted for contact with the face of the saw, substantially as shown and described.



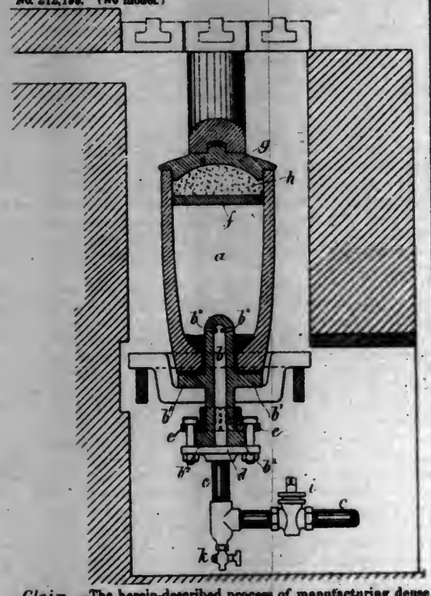
3. In an implement for side-dressing the teeth of saws, the combination, with a body provided with a handle at the outer extremity and an arbor-fork or saw-receiving arm adjustably secured to the inner face of the said body near the inner end, of a lever fulcrumed upon the inner face of the said body forward of the center and provided with a manipulating-pin near one extremity, and an offset or projection having an undercut recess in the opposite extremity, a file detachably held in the said recess of the offset or projection, and a guide-screw passing from the said lever capable of contact with the face of the said saw, substantially as shown and described.

4. The combination, with a body provided with a handle at the outer extremity, of an arbor-fork or saw-receiving block detachably secured to the inner end of said body, a lever fulcrumed upon the body forward of the center, a manipulating-pin attached to the inner end of the said lever and passing through the body, a projection formed upon the inner surface of the lever at the outer end having an undercut recess therein, a file detachably held in the said undercut recess, a guide-screw attached to the lever and capable of contact with the face of the saw, an adjustable clamp attached to the body at the outer end, and a guide-plate held in the said clamp for contact with the outer end of the said lever, all combined for operation substantially as and for the purpose specified.

405,485.

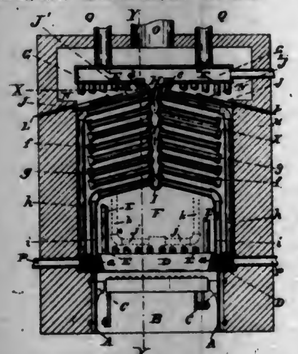
405,486. MIDDLINGS-PURIFIER.

WILLIAM KLOSTERMANN, Young America, Minn. Filed June 20, 1888. Serial No. 278,209. (No model.)



Claim.—1. In a middlings-purifier, the combination, with a rotary drum provided with elevator-strips on its inner surface, of a peaked section held stationary in the said drum, inclined riffles secured to the sides of the said peaked section, a riddling-box held to slide longitudinally below the said peaked section, which discharges into the riddling-box, a feed-spout discharging into one end of the said drum, and

Claim.—1. A printer's chase composed of four similar interlocking bars, each provided with two or more superficial notches, substantially as described.

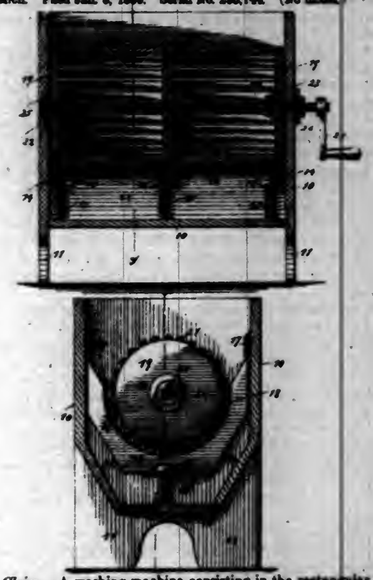


2. The combination, with a printer's chase composed of four interlocking bars, each provided with two or more superficial notches of sliding clamps which embrace the bars at their intersection, substantially as described.

405,480. MANUFACTURE OF CARBON FILAMENTS. THEOPHILUS V. HUGHES, Holywell, North Wales, and CHARLES R. CHAMBERS, South Kensington, County of Middlesex, England. Filed Aug. 30, 1886. Serial No. 212,196. (No model.)

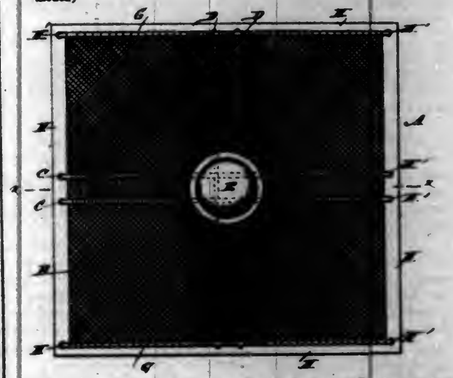
Claim.—The herein-described process of manufacturing dense, homogeneous, resilient, and hair-like carbon filaments for glow-lamps, which process consists in causing a gaseous carbon compound (capable of yielding carbon when decomposed by heat) to undergo decomposition in a heated retort, the gases while undergoing the decomposition having such motions impressed upon them that vertical or gyrating currents of gas are set up through the atmosphere of the retort, from which currents the carbon resulting from the decomposition segregates directly in the form of filaments, as hereinbefore described.

405,481. WATER-HEATER. CHARLES G. JEWETT, Howell, Mich. Filed Feb. 25, 1889. Serial No. 301,132. (No model.)



Claim.—1. In a water-heater, the combination of a lower water-ring, an upper water-chamber provided with a depending water-leg dividing the combustion-chamber transversly, and connections between the water-ring and the top and bottom of said water-leg, substantially as described.

2. In a water-heater, the combination of a lower water-ring, an upper chamber provided with a depending central water-leg dividing the combustion-chamber in two, connections between the top and bottom of said water-leg and the water-ring, direct connections between the water-ring and the water-chamber at the edge, and the heating-tubes *f*, attached to said water-leg, substantially as described.



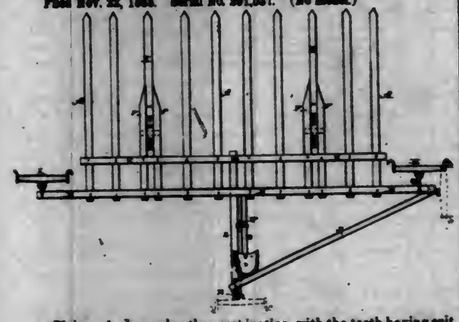
3. In a water-heater, the combination of a lower water-ring, an upper water-chamber provided with a depending water-leg having inclined steps, inclined heating-tubes engaged in suitable screw-threaded apertures therein, and the pipes A, *i*, and E, connecting the water-ring with the water-leg and water-chamber, substantially as and for the purpose described.

405,482. WASHING-MACHINE. HANS JOHNSEN, Menominee, Mich. Filed Jan. 8, 1889. Serial No. 295,744. (No model.)

Claim.—A washing-machine consisting in the rectangular tub or box 10, having a dish-shaped bottom 12, the transverse spaced blocks 14, shaped to conform to said bottom and having central transverse projections 16 on their lower sides, the springs 15, on which said projections rest, the semicircular sheet 18 of corrugated zinc extending from end to end of the box and secured to the concave upper faces of said blocks, the rotary rubber formed of centrally-apertured disks 19 20, and spaced bars 21, secured thereto, the shaft 22, the collars 23, and bearings in the ends of box for said shaft, substantially as set forth.

405,483. DIAPHRAGM FOR ACOUSTIC TELEPHONES. HENRY P. JOHNS, New York, N. Y. Filed Apr. 4, 1888. Serial No. 269,534. (No model.)

Claim.—1. As a new article of manufacture, a diaphragm for acoustic telephones, consisting of a piece of fabric having strands or cables of greater strength than the ordinary woof and weft threads of the fabric interwoven in it, the said strands or cables intersecting each other at the center to form a support for the button and line-wire, substantially as set forth.



2. As a new article of manufacture, a diaphragm for acoustic telephones, consisting of a piece of silk and woolen fabric having strands or cables of greater strength than the ordinary warp and weft threads of the fabric interwoven in it, the said strands or cables intersecting each other at the center to form a support for the button and line-wire, as set forth.

3. A piece of fabric woven of silk and woolen threads, and rods or cables crossing each other and interwoven in the said fabric, in combination with a button secured in the middle of the fabric at the intersection of the crossing rods or cables, and a wire extending from the said button, substantially as shown and described.

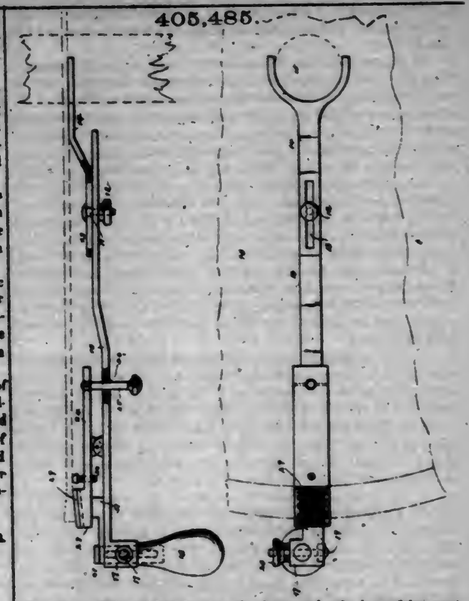
4. The combination, with a rectangular frame, of a piece of fabric woven of silk and woolen threads, rods or cables crossing each other and interwoven in the said fabric and also secured to the said rectangular frame, a button secured in the middle of the said fabric at the intersection of the crossing rods or cables, and a wire extending from the said button, substantially as shown and described.

5. The combination, with a frame, of a piece of fabric woven of silk and woolen threads, rods or cables crossing each other in the middle of the fabric and interwoven in the said fabric, being also fastened by their ends to the said frame, rods secured to the opposite ends of the fabric and fastened to the said rectangular frame, a button secured in the middle of the fabric at the intersection of the crossing rods or cables, and a wire leading from the back of the said button, substantially as shown and described.

405,484. HORSE HAY-RAKE. OREN H. KING, Houghton, Iowa. Filed Nov. 22, 1888. Serial No. 291,887. (No model.)

Claim.—1. In a rake, the combination, with the teeth having suitable transverse beams rigidly connecting their rear ends and supporting-wheels journaled in the rake-frame in advance of the transverse beams, of a rearwardly-extending beam having its front end loosely connected to the frame in the rear of the wheels, a supporting-wheel at its rear end, and an operating-bar pivoted upon the said beam having a seat upon its rear end and its front end engaging the rake-frame back of the supporting-wheels, whereby the rake automatically balances itself and the points of the teeth are forced down by the weight of the driver, substantially as shown and described.

2. The combination, with the hay-rake provided with the stringer B, which has its ends to project beyond the sides of the teeth, of the diagonal brace J, a seat-beam L, with the loop, and the singletree H, whereby the draft at one end of the stringer B can be transferred from that end of the stringer B to and along the diagonal brace J, substantially as set forth.

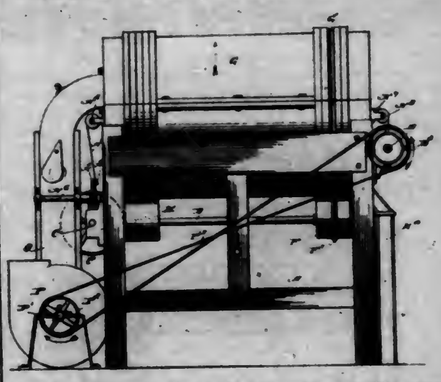


405,485. SAW-DRESSING DEVICE. WALTER KIRKPATRICK, Marinette, Wis. Filed Mar. 21, 1888. Serial No. 304,108. (No model.)

Claim.—1. An implement for side-dressing saw-teeth, comprising a body having a handle at one end, a guide fork or block detachably secured to the opposite end, and a lever fulcrumed upon the inner face of the body provided with a guide-screw and a detachable file, all combined for operation substantially as shown and described.

2. In an implement for side-dressing the teeth of saws, the combination, with a body provided with a handle at the outer extremity, of an arbor fork or block adjustably secured to the inner side of the said body near the inner end, a lever fulcrumed upon the said inner side of the body forward of the center, having an undercut recess in the outer extremity, a file detachably held in the said undercut recess, and a guide-screw adapted for contact with the face of the saw, substantially as shown and described.

3. In an implement for side-dressing the teeth of saws, the combination, with a body provided with a handle at the outer extremity and an arbor-fork or saw-receiving arm adjustably secured to the



405,485.

inner face of the said body near the inner end, of a lever fulcrumed upon the inner face of the said body forward of the center and provided with a manipulating-pin near one extremity, and an offset or projection having an undercut recess in the opposite extremity, a file detachably held in the said recess of the offset or projection, and a guide-screw passing from the said lever capable of contact with the face of the said saw, substantially as shown and described.

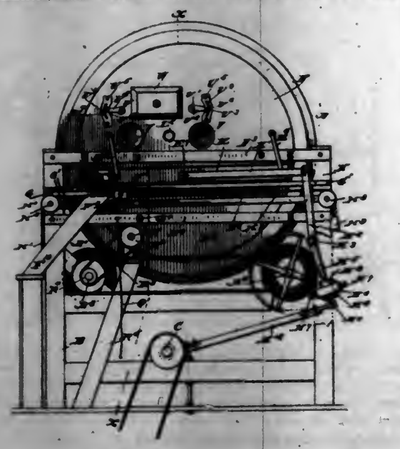
4. The combination, with a body provided with a handle at the outer extremity, of an arbor-fork or saw-receiving block detachably secured to the inner end of said body, a lever fulcrumed upon the body forward of the center, a manipulating-pin attached to the inner end of the said lever and passing through the body, a projection formed upon the inner surface of the lever at the outer end having an undercut recess therein, a file detachably held in the said undercut recess, a guide-screw attached to the lever and capable of contact with the face of the saw, an adjustable clamp attached to the body at the outer end, and a guide-plate held in the said clamp for contact with the outer end of the said lever, all combined for operation substantially as and for the purpose specified.

405,486. MIDDLINGS-PURIFIER. WILLIAM KLOSTERMANN, Young America, Minn. Filed June 26, 1888. Serial No. 278,290. (No model.)

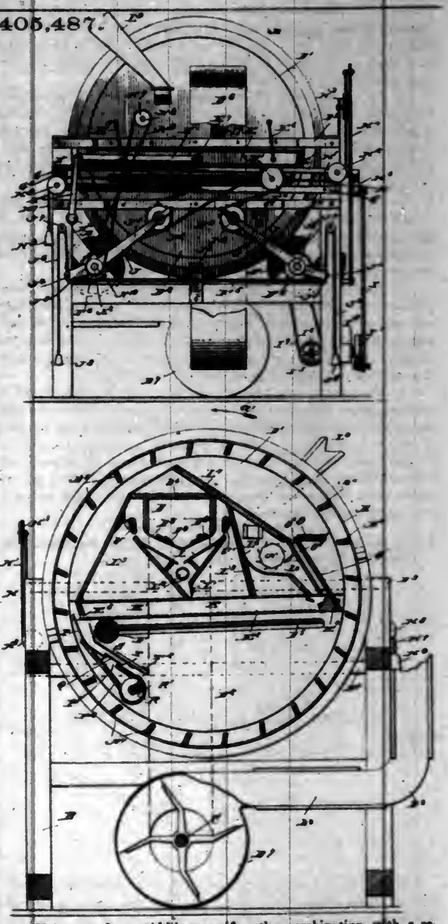
Claim.—1. In a middlings-purifier, the combination, with a rotary drum provided with elevator-strips on its inner surface, of a peaked section held stationary in the said drum, inclined riffles secured to the sides of the said peaked section, a riddling-box held to slide longitudinally below the said peaked section, which discharges into the riddling-box, a feed-spout discharging into one end of the said drum, and

an outlet-chamber at the other end of the said riddling-box and into which the last inclined riffles discharge, substantially as shown and described.

2. The combination, with the rotary drum having longitudinally-extending elevator-stripe and a feed-spout which discharges into one end of the drum, of the relatively stationary inverted-V-shaped distributing-box within the drum, longitudinally-extending depending walls I^2, having ways on their inner sides within the distributing-box, a reciprocating apertured plate N, mounted on said ways, an exhaust-fan opening in the said box at one end above the screen, and a reciprocating riddling-box under the distributer-box having apertured side plates K^2, provided at their upper ends with inclined boards K^3, extending under the lower longitudinal edges of the distributing-box, a vertical series of inclined ribs K^4 on the inner faces of said side plates, and a vertical series of oppositely-inclined boards K^5 under each wall I^2 and discharging upon the ribs K^4, a central passage being formed between the said two series of boards opening into the space between walls I^2 below the reciprocating plate, and the bottom K^2, inclined oppositely from the center of the space between the boards K^5, substantially as set forth.



3. The combination, with a rotary elevator-drum, of the relatively stationary inverted-V-shaped distributing-box therein, a longitudinally-reciprocating apertured plate within said box, and an exhaust-opening O in one end of the box above the plate, the riddling-box under the distributing-box having inclined boards K^3 on the upper edges of its sides, and two series of alternating inclined ribs and boards, the space between the series of boards being directly under the reciprocating plate, substantially as set forth.



4. The combination, with the elevator-drum, open at both ends and the operating-rollers on which said drum rests, of the relatively stationary inverted-V-shaped distributing-box H, extending longitudinally within the box and having heads H′ H^6 at its ends closing the ends of the drum, a feed-spout leading through the lower part of the front head, an exhaust-fan opening in the rear head leading into the distributing-box, a discharge-outlet in said rear head below the distributing-box, and a perforated longitudinally-reciprocating riddling-box under the distributing-box, substantially as set forth.

5. In a middlings-purifier, the combination, with a rotary drum provided with elevator-stripe on its inner surface, of a middlings-distributing box held stationary in the said drum, a peaked section formed on the said distributing-box, riffles secured to the sides of the said peaked section, a riddling-box held to reciprocate longitudinally below the said peaked section, which discharges on the riddling-box, an exhaust-fan connecting by its exhaust-spout with the interior of the peaked section, and a longitudinally-reciprocating perforated plate directly under the peaked section, the perforations of the reciprocating-plate increasing in size from the front toward the rear end thereof, substantially as shown and described.

6. In a middlings-purifier, the combination, with a distributing-box and a perforated plate held to slide in the said distributing-box, of a weighted rope secured to one end of the said plate, a second rope secured to the other end of said plate, a lever connected with the other end of the said second rope, and a wheel having a rotary motion and provided with a pin acting on the said lever, substantially as shown and described.

405,487. MIDDLINGS-PURIFIER. WILLIAM KLOSTERMANN, Young America, Minn. Filed Nov. 13, 1888. Serial No. 290,659. (No model.)

Claim.—1. In a middlings-purifier, the combination, with a revolving drum provided with elevator-stripe, of a fixed head-section held in the open ends of the said drum, a suction-box held on the said head-sections in the interior of the drum and provided with a perforated bottom, a trough held below the said suction-box, and a vibrating screen-box held in the said drum below the said trough, substantially as shown and described.

2. In a middlings-purifier, the combination, with a revolving drum provided with elevator-stripe, of a fixed head-section held in the open ends of the said drum, a suction-box held on the said head-sections in the interior of the drum and provided with a perforated bottom, a trough held below the said suction-box, a vibrating screen-box held in the said drum below the said trough, and an inclined longitudinal wall held on the said head-sections inside of the said drum and onto which discharge the elevator-stripe, the lower edge of the said wall discharging into the screen-box, substantially as shown and described.

3. In a middlings-purifier, the combination, with a revolving drum provided with elevator-stripe, of a fixed head-section held in the open ends of the said drum, a suction-box held on the said head-sections in the interior of the drum and provided with a perforated bottom, a trough held below the said suction-box, a vibrating screen-box held in the said drum below the said trough, an inclined longitudinal wall held on the said head-sections inside of the said drum and onto which discharge the elevator-stripe, and a channel into which discharges the lower end of the said wall and which opens into the screen-box, and inclined strips held in the said channel to cause a forward and downward motion of the middlings, substantially as shown and described.

4. In a middlings-purifier, the combination, with a revolving drum provided with elevator-stripe, of a fixed head-section held in the open ends of the said drum, a suction-box held on the said head-sections in the interior of the drum and provided with a perforated bottom, a trough held below the said suction-box, a vibrating screen-box held in the said drum below the said trough, an inclined longitudinal wall held on the said head-section inside of the said drum and onto which discharge the elevator-strips, a channel into which discharges the lower end of the said wall and which opens into the screen-box to which it is secured, inclined strips held in the said channel to cause a forward motion of the middlings, and a pan secured on the outer wall of the said channel, and also discharging onto the inclined strips, substantially as shown and described.

5. In a middlings-purifier, the combination, with a revolving drum provided with elevator-strips, of fixed head-sections held in the open ends of the said drum, a suction-box held on the said head-sections in the interior of the drum and provided with a perforated bottom, a trough held below the said suction-box, a vibrating screen-box held in the said drum below the said trough, an inclined longitudinal wall held on the said head-sections inside of the said drum and onto which discharge the elevator-strips, a channel secured on the said screen-box and discharging into the same and receiving its supply partly from the said wall, inclined strips held in the said channel to cause a forward motion of the middlings, and a pan secured to the said channel to vibrate with the screen, and also discharging onto the inclined strips, substantially as shown and described.

6. In a middlings-purifier, the combination, with a revolving drum provided with elevator-strips, of a vibrating screen-box held in the interior of the said drum and provided with a bottom screen and an outlet-spout, a trough held above the said screen-box and provided with a door, and a suction-box held above the said trough and provided with a perforated bottom, substantially as shown and described.

7. In a middlings-purifier, the combination, with a revolving drum provided with elevator-strips, of a vibrating screen-box held in the interior of the said drum and provided with a bottom screen and an outlet-spout, a trough held above the said screen-box and provided with a door, a suction-box held above the said trough and provided with a perforated bottom, and a perforated pipe held in the said trough and extending to the outside, substantially as shown and described.

8. In a middlings-purifier, the combination, with the revolving elevator-drum, the fixed heads at the ends thereof and the vibrating screen therein, of the longitudinally-extending suction-box secured to the heads above the screen and having a perforated bottom, the inclined longitudinal wall secured to said heads within the drum and upon which said drum discharges, a channel discharging upon the screen and receiving from the lower edge of said wall, a trough under the said suction-box and discharging upon the screen, a feed-compartment under said inclined wall between said channel and suction-box and having an inclined bottom discharging upon the screen adjacent to the discharge end of said channel, and the feed-wheel within said compartment, substantially as set forth.

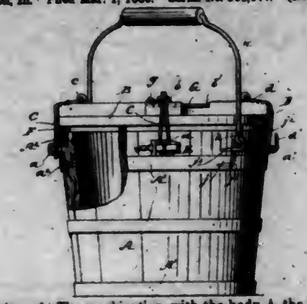
9. In a middlings-purifier, the combination, with a revolving drum, of a vibrating screen-box held in the said drum, and a feed-wheel provided with adjustable plates having lugs for feeding a regular quantity of middlings into the said screen-box, substantially as shown and described.

10. The combination, with the revolving elevator and drum having stationary heads and the horizontal reciprocating screen, of the inclined plate P, extending longitudinally under the discharge edge of the screen and having an opening P′ between its edges, a slide to regulate said opening, the board P^3 under the plate P, a conveyer into which said board P^3 discharges when the slide is open, and the inclined strip S, extending longitudinally from one head to the other above the plate P and discharging at its lower edge into the drum, substantially as set forth.

11. In a middlings-purifier, the combination, with the screen, of separate and independent frames at the ends of the screen, reciprocating bearings mounted thereon, the brush mounted on said bearings, the vibrating lever H^4, pivoted between its ends, the pulleys H^5 H^5, the cords H′, passing over said pulleys and connecting the ends of the lever H^4 with said bearings for sliding them in one direction, and the weighted ropes connected with the bearings for sliding them in the opposite direction, substantially as set forth.

12. In a middlings-purifier, the combination, with the screen, of the frames, the reciprocating bearings mounted thereon, the brush journaled in said bearings and having a sprocket-wheel on one end, an operating sprocket-chain therefor, and counterbalanced self-acting belt-tighteners, substantially as set forth.

13. The combination, with the screen, of the rotary reciprocating brush thereunder having a sprocket-wheel, the sliding bearings for said brush, the centrally-pivoted vibrating lever H^4, the pulleys H^5 H^5, the ropes H′, passing from opposite ends of said lever over said pulleys and secured to said bearings to slide them in one direction, weighted ropes for sliding the bearings in the opposite direction, the operating crank-shaft, the link connecting said lever with said crank-shaft, and the sprocket-chain passing over said sprocket-wheel to rotate the brush while being reciprocated, substantially as set forth.

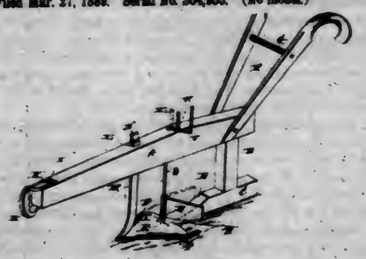


14. In a middlings-purifier, the combination, with a vibrating screen-box, of a brush secured on a shaft, bearings carrying the said shaft, a vertically-adjustable frame carrying the said bearings, the device H, for imparting a sliding motion to the said bearings on the said frame, the device I, for operating the said device H, a sprocket-wheel held on the said shaft, a traveling sprocket-chain passing over the said sprocket-wheel to rotate the said brush, and self-acting belt-tighteners, substantially as described, and operating on the said sprocket-chain, as set forth.

15. In a middlings-purifier, the combination, with the screen-box E, mounted to swing, of the links K′, connected with the said box E, the arms K^9, pivotally connected with the said link, the shaft K^8, carrying the said arms, the arms K^4 K^5, fastened on the said shaft and carrying the frame K^6, the adjustable sphere-segments K^7, held in the said frame, the rubber ball K^8, inclosed in the said segments, and the arm K^{10}, held loosely on the said shaft K^8 and supporting the said rubber ball K^8, substantially as shown and described.

16. In a middlings-purifier, the combination, with the screen-box E, mounted to swing, of the links K′, connected with the said box E, the arms K^9, pivotally connected with the said link, the shaft K^8, carrying the said arms, the arms K^4 K^5, fastened on the said shaft and carrying the frame K^6, the adjustable sphere-segments K^7, held in the said frame, the rubber ball K^8, inclosed in the said segments, the arm K^{10}, held loosely on the said shaft K^8 and supporting the said rubber ball K^8, and an eccentric pivotally connected with the said arm K^{10}, to impart a swinging motion to the same, substantially as shown and described.

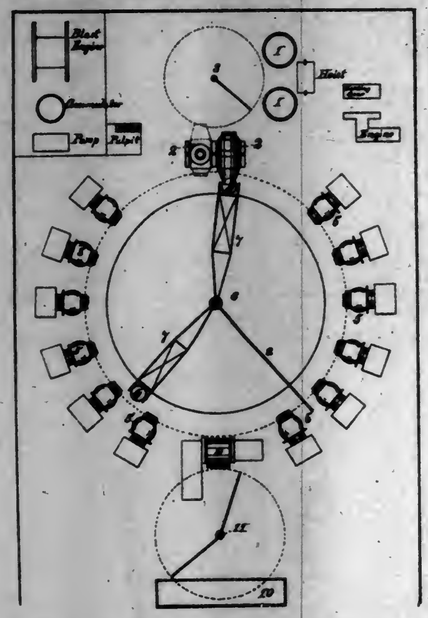
17. In a middlings-purifier, the combination, with the suction-box D, provided with the perforated V-shaped bottom D^2, of the strips D^3, held on the said perforated bottom and having the slots D^{10}, and the bolts D^{11}, for securing the said strips to the said bottom, substantially as shown and described.



405,488. OYSTER-PAIL. JOHN P. KUHN and JAMES A. REYNOLDS, Alton, Ill. Filed Mar. 1, 1889. Serial No. 301,677. (No model.)

Claim.—1. The combination, with the body A, the hinged cover B, and a hook encircling the former, of the staple *a*, which is arranged in a vertical plane and projects laterally, one of its legs having a shoulder that lies beneath the said hoop, as shown, and the looped hasp hinged to the cover and adapted to pass over said staple, all as shown and described.

2. The combination, with the body of the pail, its cover, the looped and hinged hasp C, and a staple *a*, which receives the same, of the seal, consisting of a sheet-metal piece E, having its wider end underlying the hasp and provided with two parallel slots, the said staple lying in one of said slots and the narrower end of the seal passing over the hasp and through the staple and outer slot of the seal, all as shown and described.

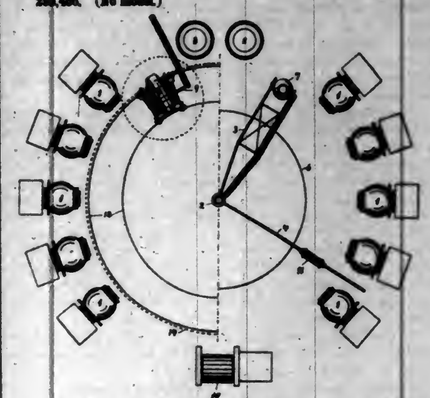


405,489. SIDE-HILL PLOW. FRIEDRICH KUETTEMAN, Troy, Ill. Filed Mar. 27, 1889. Serial No. 304,963. (No model.)

Claim.—1. The beam A, having the depending standard B, provided with the forwardly-projecting arm C, having the share O fitted thereupon, in combination with the crank-rod S, journaled in the beam, and arm C, and provided with the rearwardly-projecting wing U, substantially as specified.

2. A plow-beam A, having the standard B, and arm C, the latter cut away, as at D, and recessed, as at E, and the share O, having keeper R, adapted to receive the cut-away portion D, and having an opening vertically aligning with the recess E, in combination with the crank-rod S, vertically journaled in the beam A, and terminating in the recess E, and having the wing U, substantially as specified.

405,490. PLANT FOR THE MANUFACTURE OF WROUGHT-IRON. GUSTAV LEDEBURSAL, Pittsburg, Pa. Filed July 2, 1887. Serial No. 243,210. (No model.)



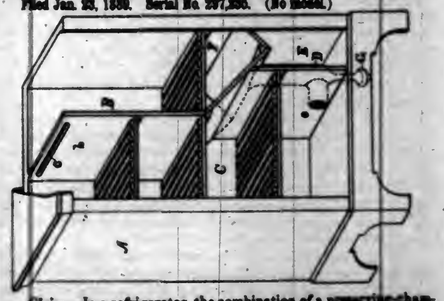
Claim.—1. In a plant for the manufacture of wrought-iron billets or muck-bars, the combination of one or more refining-furnaces, a series of two or more puddling-furnaces arranged on the arc of a circle, a ladle movable from the refining-furnaces to and along the line of the puddling-furnaces, and a crane located in the center of the circle of the puddling-furnaces and provided with a jib adapted to swing around in the line of the puddling-furnaces, substantially as set forth.

2. In a plant for the manufacture of wrought-iron billets or muck-bars, the combination of one or more refining-furnaces, a series of two or more puddling-furnaces arranged on the arc of a circle, a ladle movable from the refining-furnaces to and along the line of the puddling-furnaces, a crane located in the center of the circle of the puddling-furnaces and provided with a jib adapted to swing around in the line of the puddling-furnaces, and a squeezer located within the sweep of the crane-jib, substantially as set forth.

3. In a plant for the manufacture of wrought-iron billets or muck bars, the combination of a crane, one or more melting-furnaces, one or more refining-furnaces, the melting and refining furnaces being located in such relation to each other and to the crane that the metal may be transferred from one to the other by said crane, two or more puddling-furnaces arranged on the arc of a circle passing through the refining-furnaces, a crane located at the center of said circle, and a ladle carried by said crane, substantially as set forth.

4. In a plant for the manufacture of wrought-iron billets or muck-bars, the combination of one or more melting-furnaces, one or more refining-furnaces, a crane so located as to be able to transfer the metal from the melting to the refining-furnaces, a series two or more puddling-furnaces, a squeezer, the puddling-furnaces and squeezer being arranged on the arc of a circle passing through the refining-furnaces, and a centrally-located crane provided with suitable jibs, whereby the metal may be transferred from the refining-furnaces to the puddling-furnaces and thence to the squeezer, substantially as set forth.

405,491. METALLURGICAL PLANT. GUSTAV LEDEBURSAL, Pittsburg, Pa. Filed Sept. 28, 1887. Renewed Jan. 4, 1889. Serial No. 295,466. (No model.)

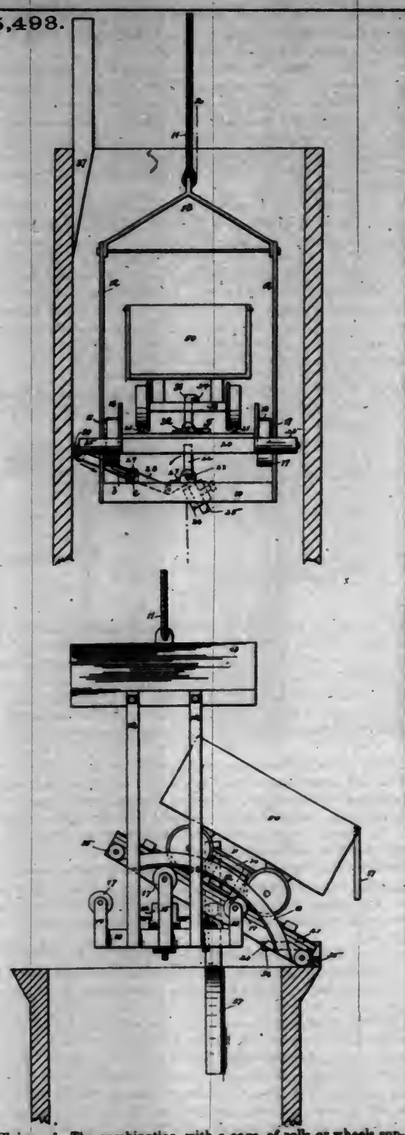


Claim.—1. In a plant for the manufacture of wrought-iron billets or muck-bars, the combination of one or more blast or melting furnaces, a series of two or more puddling-furnaces, the melting and puddling furnaces being arranged on the arc of a circle, and a converter portable along the line of said furnaces, whereby a charge of molten metal may be poured directly into a converter from the melting or blast furnace and after purification therein poured directly into one or more of the puddling-furnaces, substantially as set forth.

2. In a plant for the manufacture of wrought-iron billets or muck-bars, the combination of one or more blast or melting furnaces, a series of two or more puddling-furnaces, the melting and puddling furnaces being arranged on the arc of a circle, and a converter and tongs portable along the line of the melting and puddling furnaces, substantially as set forth.

3. In a plant for the manufacture of wrought-iron billets or muck-bars, the combination of one or more blast or melting furnaces, a series of two or more puddling-furnaces, the melting and puddling furnaces being arranged on the arc of a circle, a converter portable along the line of the melting and puddling furnaces, a squeezer located on the arc of a circle with the furnaces, and tongs portable along the line of the puddling-furnaces and squeezer, substantially as set forth.

4. In a plant for the manufacture of wrought-iron billets or muck-bars, the combination of one or more blast or melting furnaces, a series of two or more puddling-furnaces, a squeezer, said furnaces and squeezer being arranged on the arc of a circle, a crane provided with swinging jibs located in the center of said circle, and a converter and tongs mounted on the jibs of the crane and movable along the line of the furnaces and squeezer, substantially as set forth.

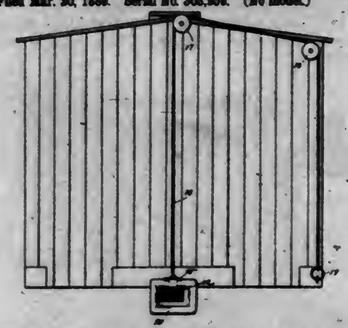


405,492. REFRIGERATOR. WILLIAM R. MONROE, Cleveland, Ohio. Filed Jan. 23, 1889. Serial No. 297,330. (No model.)

Claim.—In a refrigerator, the combination of a preserving-chamber and an ice-box with a permanently-inclosed chamber beneath said ice-box, and a combined drip-pipe and air-duct which connects with the ice-box and passes through said inclosed chamber out through the bottom of the refrigerator, and which has a passage through its side connected with the preserving-chamber, substantially as and for the purpose specified.

405,498. AUTOMATIC DUMPING ATTACHMENT FOR HOISTING-CAGES. HUGH MURRAY, Sparta, Ill. Filed Feb. 26, 1888. Serial No. 301,196. (No model.)

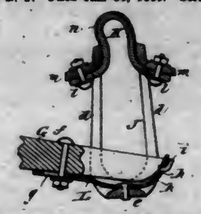
405,498.



Claim.—1. The combination, with a cage, of rolls or wheels supported at the sides thereof, a platform, segmental irons carried by said platform and arranged to rest upon the cage rolls or wheels, and a means for locking the platform to the cage, substantially as described.

2. The combination, with a cage, of rolls or wheels mounted at the sides thereof, a platform, segmental angle-irons carried by the platform and arranged to rest upon the cage rolls or wheels, a rock-shaft, a latch carried thereby and arranged to enter the space between the platform cross-timbers, and a means, substantially as described, for throwing the latch from engagement with the platform, as and for the purpose stated.

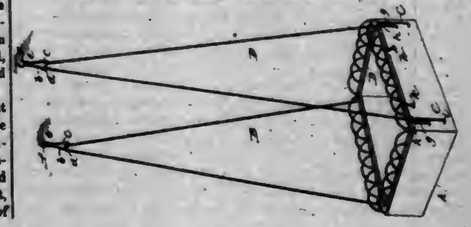
3. The combination, with a cage, of rolls or wheels arranged at the sides thereof, a platform, segmental angle-irons carried by the platform and arranged to rest upon the cage rolls or wheels, a rock-shaft carried by the cage, a latch carried by the shaft, a weight connected to the shaft, a slotted arm mounted upon a standard carried by the cage and connected to a lever that is secured to the rock-shaft, a roller carried by the end of the arm, a cam arranged in the path of the roller, and stops arranged to engage projections at one end of the platform, substantially as described.



4. The combination, with a hoist-cage, of a shaft 23, mounted thereon, a latch 22, carried by the shaft, a lever 25, connected to the shaft, a weight 26, mounted upon the lever, a second lever 27, also connected to the shaft, an arm 28, pivotally connected to the lever 27 and formed with a slot *b*, a stud *c*, which passes through the slot *b* and engages a standard 29, a roller 30, carried at the end of the arm, a cam-faced projection 37, arranged in the path of the roller, rollers 17, mounted upon standards 14, 15, and 16, a platform 20, segmental angle-irons 18, carried by the platform, rollers 35, also carried by the platform, and stops 36, which extend into the path of the rollers 35, substantially as described.

405,494. CAR-COUPLING. WILLIAM C. MCCORD, Springfield, Ky. Filed Mar. 20, 1889. Serial No. 303,969. (No model.)

Claim.—A car-coupler comprising a draw-head secured to the car and having a longitudinally-extending vertically-swinging catch 12, provided with a hook 14, and top plate 15, pulleys 17 18, secured to the end of the car at its middle and side, a ring 19, secured to the car below pulley 18, and the cord 16, secured to the inner upper corner of the catch, passed over said pulleys and secured at its lower end to the ring, substantially as set forth.

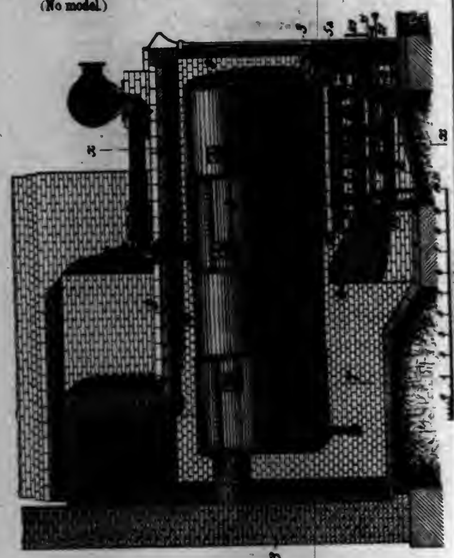


405,495. PICKER-STAFF CONNECTION FOR LOOMS. JOHN MCGINNIS, Valatie, N. Y. Filed Jan. 31, 1889. Serial No. 298,164. (No model.)

Claim.—1. The combination, with the rocker D of the picker-staff and the treadle G, operating the latter, of the metal stirrup J, attached to said treadle, and the flexible strap K, attached to the stirrup and adapted to receive the end of the picker-staff rocker within it, substantially as specified.

2. The combination, with a picker-staff and its rocker D and treadle G, operating said staff, of the metal stirrup J, the adjustable flexible strip of leather L, attached to said treadle and having the stirrup J, in which the treadle rests, secured to it, and the flexible-strap connection K, secured to the upper end of the stirrup and serving to receive the end of the rocker within it, essentially as shown and described.

405,496. CHILD'S SWING. JAMES M. MCCORD, Montgomery, Ind. Filed Oct. 8, 1888. Serial No. 287,536. (No model.)



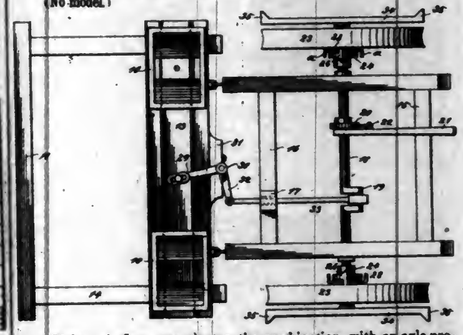
405,496.

Claim.—The combination, with the swing-box A, of the removable raised frame D, the removable seat E, and fastenings securing either said frame or seat to the box, essentially as described.

405,497. GAS-BURNER FOR BOILER-FURNACES. TERRENCE MCSWEENEY, Allegheny, Pa. Filed Mar. 7, 1889. Serial No. 302,325. (No model.)

Claim.—1. The combination, with a boiler-furnace, of two perforated burner-pipes each supported longitudinally within and adjacent to one side of the furnace above the grate-level, mixer-pipes leading through the furnaces from the burner-pipes into the ash-pit and having open lower ends, and gas-jet pipes communicating with a common supply-pipes and leading into the lower ends of the mixer-pipes, substantially as set forth.

2. The combination, with a boiler-furnace, of two perforated burner-pipes each supported longitudinally within and adjacent to one side of the furnace above the grate-level, a series of grate-bars supported in the furnace below said burner-pipes and between the vertical planes thereof, mixer-pipes leading through the furnace from the burner-pipes into the ash-pit and having open lower ends, and gas-jet pipes communicating with a common supply-pipe and leading into the lower ends of the mixer-pipes, substantially as set forth.



3. The combination, with a boiler-furnace, of two perforated burner-pipes each supported longitudinally within and adjacent to one side of the furnace above the grate-level, mixer-pipes leading through the furnace from the burner-pipes into the ash-pit and having open lower ends, two or more connected gas-distribution pipes supported in the ash-pit, gas-jet pipes leading from said distribution-pipes into the lower ends of the mixer-pipes, and a gas-supply pipe communicating with said distribution-pipes, substantially as set forth.

4. The combination, with a boiler-furnace, of two burner-pipes each supported longitudinally within and adjacent to one side of the furnace above the grate-level and perforated with burner-openings on its side nearest the center of the furnace, a series of grate-bars supported in the furnace below said burner-pipes and between the vertical planes thereof, a brick filling interposed between each of the outer grate-bars and the adjacent side of the furnace, a layer of brick or other refractory material supported on the top of each burner-pipe, mixer-pipes leading through the furnace from the burner-pipes into the ash-pit and having open lower ends, and gas-jet pipes communicating with a common supply-pipe and leading into the lower ends of the mixer-pipes, substantially as set forth.

5. The combination, with a boiler-furnace, of two perforated burner-pipes each supported longitudinally within and adjacent to one side of the furnace above the grate-level, mixer-pipes leading from the burner-pipes into the ash-pit of the furnace and having open lower ends, gas-jet pipes communicating with a common supply-pipe and leading into the lower ends of the mixer-pipes, and steam-jet pipes controlled by regulating-valves and leading into the mixer-pipes, substantially as set forth.

6. The combination, with a boiler-furnace, of two perforated burner-pipes each supported longitudinally within and adjacent to one side of the furnace, mixer-pipes leading from the burner-pipes into the ash-pit of the furnace and having open lower ends, gas-jet pipes communicating with a common supply-pipe and leading into the lower ends of the mixer-pipes, supplemental air-supply pipes leading from the burner-pipes into the ash-pit, regulating doors or valves hinged or pivoted to the lower ends of said supplemental air-supply pipes, and steam-jet pipes controlled by regulating-valves and leading into the supplemental air-supply pipes, substantially as set forth.

405,498. CORN-PLANTER. JAMES R. PATTERSON and MARSHAL T. FOSTER, Madison, Kans. Filed Feb. 19, 1889. Serial No. 300,425. (No model.)

Claim.—1. In a corn-planter, the combination, with an axle provided with a crank-arm, a seed drop-bar, a vertical shaft journaled to the rear of the drop-bar, and connection between the upper end of the said shaft and the drop-bar and the lower end of the shaft and the crank-arm of the axle, of drive-wheels loosely mounted upon the axle, a marker rigidly secured to the ends of the axle outside of the drive-wheels, a ratchet-wheel rigidly secured to the axle near the inner face of each drive-wheel, and spring-actuated pawls pivoted to the drive-wheels and capable of engagement with the said ratchet-wheels, all combined for operation substantially as shown and described.

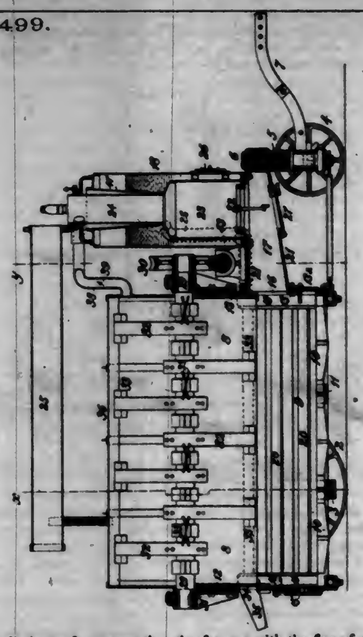
2. In a corn-planter, the combination, with an axle provided with a crank-arm, a seed drop-bar, a vertical shaft journaled to the rear of the drop-bar, and connection between the upper end of the said shaft and the drop-bar and the lower end of the shaft and the crank-arm of the axle, of drive-wheels loosely mounted upon the axle, a marker rigidly secured to the ends of the axle outside of the drive-wheels, a ratchet-wheel rigidly secured to the axle near the inner face of each drive-wheel, spring-actuated pawls pivoted to the drive-wheels and capable of engagement with the said ratchet-wheels, and a shifting-arm pivoted upon the axle between the ratchet-wheels and the drive-wheels and having curved ends, substantially as shown and described.

3. In a corn-planter, the combination, with a seed drop-bar, an axle provided with a crank-arm, and a connection, substantially as shown and described, between the crank-arm of the axle and the drop-bar, of drive-wheels loosely mounted upon the axle, a ratchet-wheel rigidly secured to the said axle near the inner face of each drive-wheel, and an intermediate ratchet-wheel also secured to the axle, a marker secured to each extremity of the axle outside of the drive-wheels, pawls pivoted to the drive-wheels capable of engagement with the outer ratchet-wheels of the axle, shifting-arms loosely mounted upon the axle and having curved ends, and a lever held to revolve upon the axle adjacent to the intermediate ratchet-wheel and provided with a dog adapted to engage with the said wheel, substantially as and for the purpose specified.

405,499. MACHINE FOR MIXING ASPHALT. GEORGE I. PEABODY, Pittsburg, Pa. Filed Oct. 1, 1888. Serial No. 286,853. (No model.)

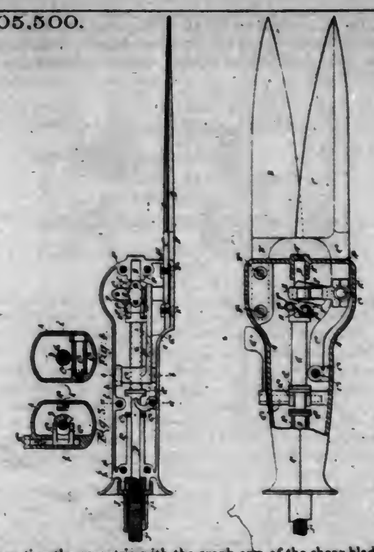
Claim.—1. In a machine for mixing asphalt, the combination of a furnace, a mixing-chamber located above said furnace, a steam-boiler, a discharge-flue connecting the furnace with the flue of said boiler, and a shield inclosing the boiler-flue within the water-space of the boiler, substantially as set forth.

2. In a machine for mixing asphalt, the combination of a furnace, a mixing-chamber located above said furnace, a steam-boiler, a discharge-flue leading from the furnace to the fire-chamber of the boiler, and a tilting or dumping grate located in the fire-chamber of the boiler, substantially as set forth.



3. In a machine for mixing asphalt, the combination of a mixing-chamber, a furnace located below said chamber, heads closing the ends of the furnace and having water-chambers formed therein, and circulating-tubes within the sides of the furnace and connecting said water-chambers of the furnace, substantially as set forth.

4. In a machine for mixing asphalt, the combination of a mixing-chamber, a mixer-shaft journaled to rotate therein, and a series of stirrer-arms secured radially upon the shaft, each arm carrying adjacent to its outer end a pair of blades which are inclined in respectively opposite directions to the longitudinal plane of the arm, substantially as set forth.



5. In a machine for mixing asphalt, the combination of a furnace, a mixing-chamber located above said furnace, a steam-boiler, and a vapor-discharge pipe leading from the mixing-chamber to the flue of said boiler, substantially as set forth.

6. In a machine for mixing asphalt, the combination of a wheeled supporting-frame, a furnace, a mixing-chamber, a mixer-shaft provided with stirrer-arms and fitted to rotate in said chamber, a steam-engine having a driving-pulley upon its crank-shaft, a boiler supplying steam thereto, a gear fitting loosely upon the crank-shaft of the engine and meshing with a gear fixed upon the mixer-shaft, and a clutch for engaging and disengaging the crank-shaft gear and crank-shaft, substantially as set forth.

405,499.

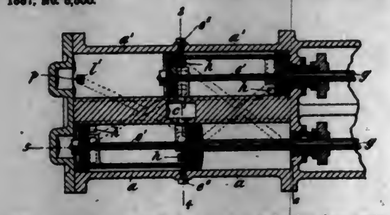
405,500.

405,500. SHEEP-SHEARS. VERNON PETTERICK, Brisbane, Queensland. Filed Nov. 9, 1887. Serial No. 254,700. (No model.)

Claim.—1. The herein-described animal-shears, consisting, essentially, of a pair of shear-blades, a handle therefor divided in two sections along its axial line, each section having semi-cylindrical bearings in said axial line, and mechanism contained within the handle for reciprocating one of the blades, comprising an eccentric connected with such blade and a driving-shaft mounted in said bearings and adapted to operate the eccentric, substantially as and for the purpose specified.

2. In animal-shears in which the cutters consist of a pair of shear-blades, the herein-described mechanism for imparting a reciprocating motion to such blades, which consists of a driving-shaft, an eccentric mounted on said shaft, a shear-blade provided with a crank-arm pivoted on a fixed pivot, and an eccentric-strap encompassing the spherical bearing-face of the eccentric and provided with a lateral arm for connecting the eccentric with the crank-arm of the shear-blade, substantially as and for the purposes specified.

3. In animal-shears in which the cutters consist of a pair of shear-blades, the herein-described mechanism for imparting a reciprocating motion to such blades and regulating the amplitude of such motion, which consists of a driving-shaft, an eccentric having a spherical bearing-face and provided with an elongated diametral opening or slot through which said shaft passes, a shear-blade provided with a crank-arm pivoted on a fixed pivot, an eccentric-strap encompassing the spherical bearing-face of the eccentric and having a lateral arm for connecting the eccentric with the crank-arm of the shear-blade, and a shifting device for shifting the position of the eccentric on the shaft, substantially as and for the purposes specified.

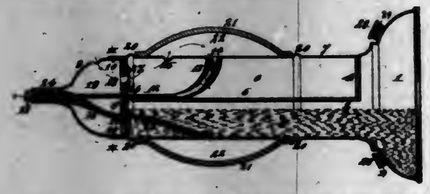


4. In animal-shears, the combination, with a handle, a pair of shear-blades whereof one is fixed to the handle and the other provided with a crank-arm pivoted at its end within said handle, of mechanism for imparting a reciprocating motion to the blade and for regulating the amplitude of such motion contained within the handle and consisting of a driving-shaft, an eccentric hinged to vibrate on said shaft, said eccentric having a spherical bearing-face and a diametral slot, through which the shaft passes, an eccentric-strap encompassing the spherical bearing-face of the eccentric and having a lateral arm for connecting said eccentric to the crank-arm of the shear-blade, and a shifting-rod connecting with the eccentric and operating to shift the position thereof on the shaft, substantially as and for the purposes specified.

5. The combination, substantially as herein described, with the crank-arm C', pivoted at C^2 and having the spherically-headed pin C^3, and the driving-shaft D, of a spherical eccentric mounted on said shaft, and an eccentric-strap provided with a lateral arm, in which is formed a spherical bearing for said pin C^3, for the purposes specified.

6. The combination, substantially as herein described, with the crank-arm C', pivoted at C^2 and having the spherically-headed pin C^3, and the driving-shaft D, provided with a boss projecting radially therefrom, of a spherical eccentric provided with a diametral slot, through which the shaft passes, said eccentric being hinged to the radial boss of said shaft, so as to vibrate thereon, a shifting-rod hinged to the eccentric and adapted to vibrate the same on the shaft, and an eccentric-strap provided with a lateral arm in which is formed a spherical bearing for the corresponding head of the pin C^3, substantially as and for the purposes specified.

7. The combination, substantially as herein described, with the crank-arm C', pivoted at C^2, and having the spherically-headed pin C^3, and the driving-shaft D, provided with a boss projecting radially therefrom, of a spherical eccentric provided with a diametral slot through which the shaft passes, said eccentric being hinged to the radial boss of said shaft, so as to vibrate thereon, an eccentric-strap encompassing the spherical eccentric and provided with a lateral arm having a spherical bearing for the corresponding head of the pin C^3, a tubular shifting-rod mounted on the driving-shaft, a hinged connection between said rod and the eccentric, and a shifting-lever connected with the tubular rod to actuate the same, for the purposes specified.

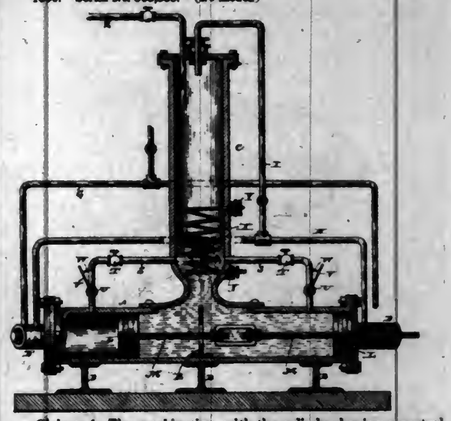


405,501. STEAM OR OTHER PUMP. GEORGE G. PICKING and WILLIAM HOPKINS, Bow, County of Middlesex, England. Filed Mar. 27, 1888. Serial No. 268,720. (No model.) Patented in England June 10, 1887, No. 8,355.

Claim.—1. The twin cylinders *a a'*, each having four ports, two at the middle leading to the opposite ends of the adjacent cylinder and two at the ends leading to the middle of such adjacent cylinder, a steam-inlet at the middle of and common to both cylinders, and a transverse exhaust-passage at the middle of and common to both cylinders, in combination with the hollow pistons forming steam-chests open to the full pressure of steam inside thereof, said pistons having ports *h h i i* and steam-cushioned at each end of the cylinders, as set forth, and a steam-port *p* at each end of each cylinder to supply steam behind the pistons after the steam-cushioning for the return-strokes of the pistons, substantially as described.

2. The twin cylinders *a a'*, having, respectively, the eduction-ports *o o'* at the middle of their length, a transverse passage *d'*, under and common to both said ports, the ports *l l'*, *n n'*, *k k'*, and *m m'*, arranged diagonally, as described and shown, and the steam-pipe *c*, common to both cylinders, in combination with the hollow pistons serving as steam-chests, receiving the full steam-pressure inside thereof direct from the steam-pipe and steam-cushioned at each end of the cylinders, each piston having two end ports *h h*, located at opposite sides of a central longitudinal line, and exhaust-cavities *i i* and a port *p* at each end of each cylinder to admit a small supply of steam behind the pistons after the steam-cushioning thereof for their return-strokes, substantially as described.

405,502. HAIR-SINGER. JOHN E. POINDEXTER, St. Louis, Mo., assignor of one-third to Joseph R. Smith and George M. Randolph, same place. Filed Jan. 31, 1889. Serial No. 298,241. (No model.)

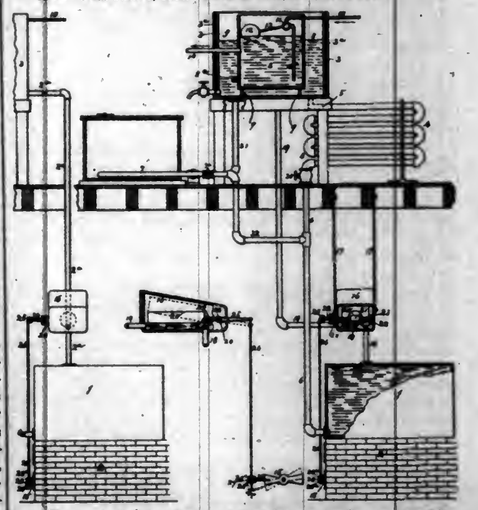


Claim.—1. In a hair-singer, the combination of the tubular burner, the draft-tube that discharges at the nozzle of said burner, the wick that projects from between said tube and tubulous burner, and the operative rubber bulb that enforces the discharge of air through the draft-tube to revivify the blaze at the burner and produce an instantaneous flash, substantially as and for the purpose set forth.

2. In a hair-singer, the combination of the tubular column having corrugations, the transverse and longitudinal partitions, the transverse disk having a wick-slot, the dome-cap having tubulous burner, the draft-tube, and the rubber operative bulb, substantially as and for the purpose set forth.

3. In a hair-singer, the combination of the tubular column, the transverse and longitudinal partitions, and transverse disk 8 within said column that, with the surrounding column, inclose and separate the alcohol-tank and secondary air-chamber, the dome-cap 9, that incloses the initial air-chamber, the bayonet-fastening that secures said dome-cap to the tubular column, the corrugations 20, that project from said column, the rubber operative bulb that is seated between said corrugations around the tubular column and incloses the operative air-chamber, between which and the secondary air-chamber is provided an open port 25, the burner-tube 24, the draft-tube with its flaring mouth, through which the air is discharged from the operative air-chamber to the nozzle of the burner to revivify the blaze, the dome-cap being provided with an open supply air-port, the transverse disk 8 being provided with a flutter-valve port that communicates between the initial and the secondary air-chambers, the flutter-valve that operates to open and close said port, the feed-ports through which the tank is replenished, and the screw-stoppers that close said ports, substantially as described, and for the purpose set forth.

405,503. GAS-PUMP FOR ICE-MAKING MACHINES. THOMAS L. RANKIN, Philadelphia, Pa. Filed Jan. 23, 1883. Renewed Mar. 29, 1889. Serial No. 305,335. (No model.)



Claim.—1. The combination, with the cylinder having a central opening communicating with a stand-pipe, of the deflecting-plate located therein below the opening leading to the stand-pipe to insure the proper circulation of the oil, substantially as specified.

2. The combination of the cylinder A, the connected pistons L L therein, the stand-pipe communicating therewith, and the valved pipe S, supplying oil to the cylinder between its heads and the piston, with the valved boxes at the cylinder-heads, respectively, having induction and eduction pipes connecting with the same, all constructed and arranged substantially in the manner and for the purpose described.

3. The combination of the cylinder, the stand-pipe centrally connected thereto, and the cooling-coil in said pipe with the deflecting-plate secured centrally in said cylinder and the adjustably-connected pistons, all constructed and arranged substantially as and for the purpose described.

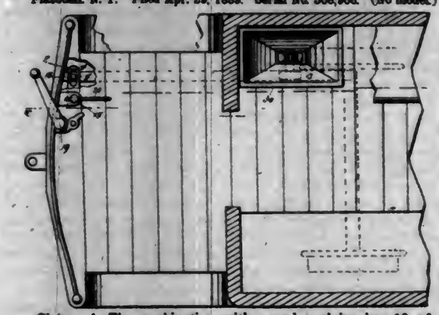
4. The combination of the cylinder, the stand-pipe communicating therewith, and the induction and eduction pipes and valves with the deflecting-plate, the pistons arranged on opposite sides of said plate, and the connections between said pistons for moving them together, all constructed and arranged substantially in the manner and for the purpose described.

405,504. HEATING APPARATUS. ISAAC C. RICHARDSON, Nashua, N. H. Filed June 9, 1887. Serial No. 240,768. (No model.)

Claim.—1. In a heating apparatus, in combination, an open circulation-tank, a smaller open tank arranged within the outer circulation-tank, a pure-water-supply pipe provided with a float-valve for automatically regulating the height of the water, a water-heater, and circulation-pipes connecting the heater and circulation-tank, substantially as and for the purpose described.

2. In a heating apparatus, in combination, an open circulation-tank, a smaller open tank for domestic supply, a pure-water-supply pipe provided with a float-valve for automatically regulating the height of the water, a water-heater, circulation-pipes, and radiating-coils connected with the outer circulation-tank and water-heater, substantially as described.

3. In a heating apparatus, in combination, a circulation-tank, a water-heater, connecting circulating-pipes, a tank arranged within the circulating-tank, a supply-pipe for the inner tank, a discharge service-pipe by which water may be drawn from the inner tank, and an automatic valve through which water may pass from the inner to the outer tank when the water in the outer tank falls below that in the inner tank, substantially as described.



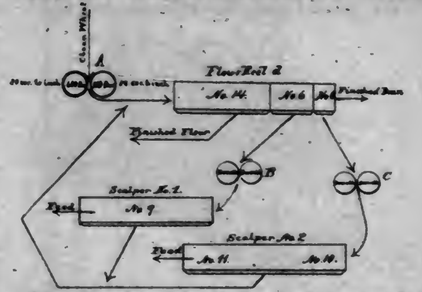
4. In a heating apparatus, in combination, an outer open circulation-tank, a water-heater, an inner tank, connecting and circulation pipes between the outer tank and the heater, a supply-pipe provided with a float-valve for controlling the water-supply to said inner tank, a discharge service-pipe for withdrawing water from said inner tank, and an automatic valve through which water may pass from the inner to the outer tank when the water in the outer is lower than in the inner tank, substantially as described.

5. In a heating apparatus, in combination, a circulation water-tank, a water-heater, connecting circulation-pipes, a water-tank arranged within the circulation-tank, a pure-water-supply pipe provided with a float-valve and entering said inner tank and discharging at or near its bottom, and a discharge service-pipe emerging from the same at a point a little below the normal water-level, substantially as and for the purpose described.

6. In a heating apparatus, in combination, a water-heater, a circulation-tank, pipes connecting the said heater and tank, an automatic draft-regulator consisting of a closed chamber, pipes entering said chamber below its top and connecting said chamber, water-heater, and circulation-tank, a float within said chamber, a draft-damper, and a connection between said float and draft-damper, substantially as and for the purpose described.

7. In a heating apparatus, in combination, a water-heater, a circulation-tank, pipes connecting said heater and tank, an automatic draft-regulator consisting of a closed chamber higher at one end than at the other, circulation-pipes entering below the top of said chamber and connecting the chamber to the upper part of the water-heater and the lower part of the circulation-tank, a float within said chamber, a shaft carrying the float and having one end passed through the wall of the chamber, and a connection between the end of said shaft and a draft-damper, substantially as and for the purpose described.

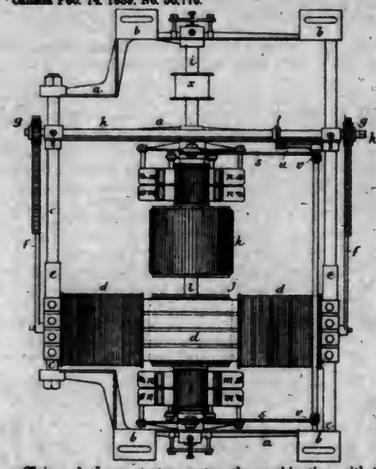
405,505. SANDING DEVICE FOR STREET-CARS. JAMES RITCHIE, Flatbush, N. Y. Filed Apr. 29, 1889. Serial No. 308,906. (No model.)



Claim.—1. The combination, with a sand-receiving box 10, of a valve 12, arranged therein, a pinion or gear 13, carried by the valve-shaft, and a rack arranged to engage the pinion, substantially as described.

2. The combination, with a sand-receiving box 10, of a valve 12, arranged therein, a pinion or gear 13, carried by the valve-shaft, and a rack supported by a boss formed upon the sand-receiving box and arranged to engage the valve gear or pinion, substantially as described.

3. In a sand-distributing device, the combination, with the sand-receiving box 10, of a four-armed valve 12, mounted therein, a gear or pinion 13, carried by the valve-shaft, a rack 15, arranged to engage the pinion, a horizontal lever to which the rack is connected, a vertical shaft which supports the lever, and a means for turning the vertical shaft, substantially as described.



4. In a sand-distributing device, the combination, with the sand-receiving box, of a valve mounted therein and provided with a gear 13, a hopper arranged above the sand-receiving box, an agitator mounted within the hopper, a gear 33, carried by the agitator-shaft and arranged for engagement with the valve-gear 13, a rack mounted to engage the gear 13, and a means, substantially as described, for reciprocating the rack, as and for the purpose stated.

405,506. PROCESS OF MILLING WHEAT. OLIVER C. RITTER, Springfield, Mo. Filed Oct. 23, 1888. Serial No. 288,967. (No model.)

Claim.—The art of manufacturing flour, consisting, essentially, in crushing or grinding the wheat in one operation between two corrugated rolls running at high differential speed, using fine corrugations for slow roll, with coarser for fast, bolting out the finished flour, separating the middlings in two grades and tailing off finished bran, regrinding said grades of middlings on separate machines, rebolting the middlings-chop on separate scalpers to tail off the "fluff" or feed-product contained therein, and rebolting these valuable portions of the middlings with the first-break flour in straight-grade work or on separate reel.

405,507. DYNAMO-ELECTRIC MACHINE. WILLIAM D. SANDWELL, Herne Hill, County of Surrey, England. Filed Feb. 13, 1889. Serial No. 299,744. (No model.) Patented in England Oct. 25, 1887, No. 14,542; in Germany Mar. 14, 1888, No. 45,183; in Belgium Mar. 30, 1888, No. 81,241; in France Mar. 31, 1888, No. 188,706; in Italy June 30, 1888, XXII, 23,317, XLVI, 392; in Spain July 13, 1888, No. 8,158; in Austria-Hungary Aug. 9, 1888, No. 14,830 and No. 31,008, and in Canada Feb. 14, 1889, No. 30,776.

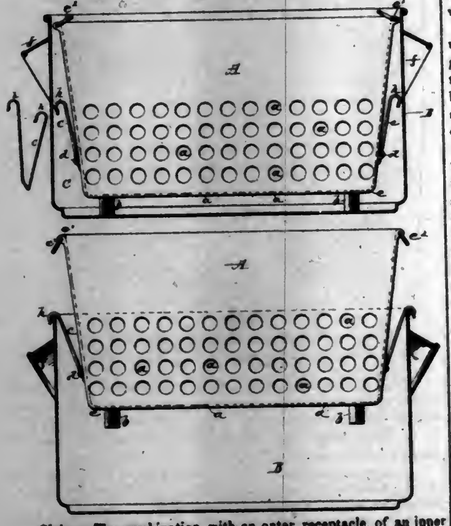
Claim.—1. In an electric motor, the combination, with the field-magnets, of two armatures, the said magnets and armatures being the one movable with respect to the other, substantially as described.

2. In an electric motor, the combination, with the movable field-magnets, of two armatures for the same, substantially as described.

3. In an electric motor, the combination, with the field-magnets, of two armatures, the said magnets being movable longitudinally of the armature-shaft, substantially as described.

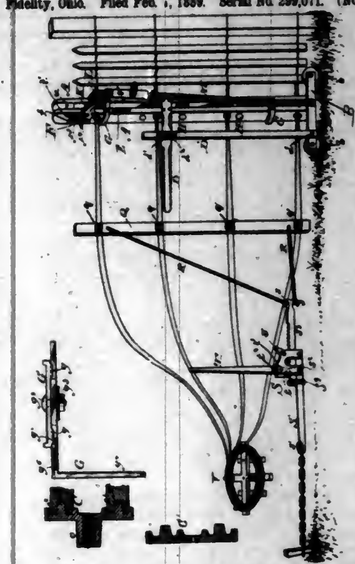
4. In an electric motor, the combination, with the field-magnets and two armatures for the same, said magnets being movable longitudinally of the armature-shaft, of a commutator for each armature, each commutator being provided with two sets of brushes, substantially as described.

5. In an electric motor, the combination, with the field-magnets and two armatures for the same, said magnets being movable longi-



tudinally of the armature-shaft, of a commutator for each armature, each commutator being provided with two sets of pivoted brushes, the brushes of one set being connected to those of the other set, whereby a movement of one set into position withdraws the others, substantially as described.

405,508. TRAVELING-BAG. ALFRED P. W. SEAMAN, New York, N. Y. Filed July 3, 1888. Serial No. 278,932. (No model.)



Claim.—In a convertible traveling-bag, the combination, with the frames A B, forming the mouth of the bag, of the supplemental frame D, pivoted to close between the frames A B, and adapted to be swung beneath said frames to support the bottom of the bag when at its normal size and to be closed within the main frames when the size of the bag is reduced, and a fastening device for holding the three frames together, as set forth.

405,509. WASH-BOILER. WILLIAM E. SMITH, Fremont, Nebr. Filed June 30, 1888. Serial No. 278,638. (No model.)

Claim.—The combination, with an outer receptacle, of an inner perforated receptacle and the rods bent into substantially U shape, the free ends of said rods having outwardly-turned ends forming hooks, the said rods being pivoted centrally to the perforated receptacle at points below the upper edge of same, so as to prevent the rods from falling inwardly past a vertical plane, substantially as set forth.

405,510. MACHINE FOR MAKING FENCES. JAMES B. STEEN, Fidelity, Ohio. Filed Feb. 7, 1889. Serial No. 299,071. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the uprights, the truck pivoted thereto, the stationary handle, the link adjustably secured thereto, and the plumb-mounted on the standards.

2. The combination, substantially as hereinbefore set forth, of the uprights having a series of holes or perforations, the brackets J, having central openings tapered, as described, and laterally-projecting arms J', secured to the inner sides of the uprights adjacent to the holes or perforations, the sprocket-wheels having tapered flanges or hubs on each side fitting in the brackets, said hubs being provided with grooves on their periphery communicating with perforations extending through the body of the wheels and through which the wires extend.

3. The combination, substantially as hereinbefore set forth, of the uprights, the wire-twisting devices, and the horizontally-adjustable gages, each consisting of a base-piece G', secured transversely across the edges of the uprights and provided with guide-lugs g, a slotted bar g', through which extends an adjustable securing-bolt, and the arm g^4, extending at right angles from the slotted bar across the face of the uprights.

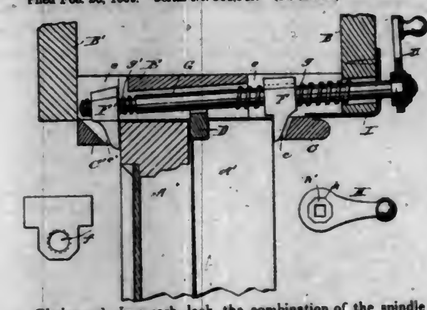
4. The combination, substantially as hereinbefore set forth, of the uprights made in two parts, the spacing-blocks, the base-piece, the clamping-plates or castings C C' at the lower ends of the uprights, said clamping-plate C being provided with a boss c, extending through the base-piece, and with grooves c', in which the edges of the uprights are seated, and with lugs c^2, engaging with the uprights, and said casting C' being provided with similar grooves and lugs engaging with the opposite edges of the uprights, and a bolt extending through the uprights and the base-piece and securing the castings together, the wire-twisting sprocket-wheels, and the endless chain for operating them.

5. The combination, substantially as hereinbefore set forth, of the uprights, the sprocket-wheels, the chain extending over the sprocket-wheels, the bars having hooked ends secured to the opposite ends of the chain, one of said bars having a slot in its end, as described, the chain-operating handle, and a bolt extending through the bars and the handle, for the purpose specified.

6. The combination, substantially as hereinbefore set forth, of the clamp-carrying post and the wire-clamping devices, each consisting of a base-piece g, having a curved block g', provided with grooves g^3, in which the wires lie, and with guide-lugs g^2, a cap g^3, having grooves g^4, into which the guide-lugs on the base-piece fit, said cap being curved on its inner side to correspond with the curved base-block, and the cam-lever for forcing the cap into engagement with the block.

7. The combination, substantially as hereinbefore set forth, of the curved base-block, the correspondingly-curved cap, the grooves formed in the cap and base-block through which the wires extend, the bolt extending through the base-block and cap, and the cam-lever attached to the bolt.

405,511. GUIDE FOR PISTON-RODS. DANIEL W. UNSTEAD, Burlington, Ky. Filed Sept. 5, 1888. Serial No. 284,653. (No model.)



Claim.—1. The combination, with a cylinder and a longitudinal sectional sleeve, of a cylinder-head forming an integral portion of the lower sleeve-section provided with a central aperture, a stuffing-box surrounding said aperture, a gland inserted in said stuffing-box, and a sectional bushing detachably secured in said sleeve at the end opposite to that carrying the cylinder-head, substantially as and for the purpose specified.

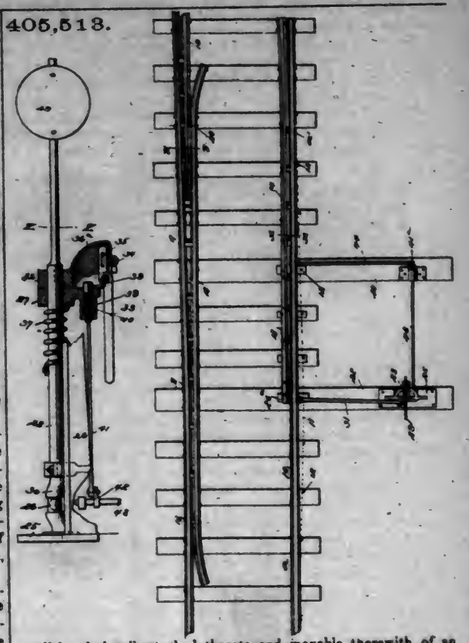
2. The combination, with a sleeve adapted for attachment to a cylinder and divided longitudinally in two sections, of a disk integral with one end provided with a central aperture adapted to receive a piston-rod, a stuffing-box surrounding the said aperture, a gland inserted in said stuffing-box, and a bushing detachably held in the opposite end of the sleeve divided into two sections and provided with an essentially diamond-shaped aperture, substantially as and for the purpose specified.

3. The combination, with a cylinder, a sleeve adapted for attachment thereto divided into two sections, and a disk integral with one section at one end forming a cylinder-head, provided with an aperture adapted to receive a piston-rod, of a stuffing-box surrounding the aperture in the disk, a gland inserted in said stuffing-box, a packing intervening the end of the gland and contiguous face of the stuffing-box, and a sectional bushing detachably held in the opposite end of the said sleeve provided with an essentially diamond-shaped aperture, as and for the purpose specified.

4. The combination, with a cylinder, a sleeve adapted for attachment thereto divided into two sections, and a disk integral with one section, at one end forming a cylinder-head, provided with an aperture adapted to receive a piston-rod, of a stuffing-box surrounding the aperture in the disk, a gland inserted in said stuffing-box, a packing intervening the end of the gland and contiguous face of the stuffing-box, a sectional bushing detachably held in the opposite end of the said sleeve provided with an essentially diamond-shaped aperture, and a piston-rod circular in cross-section at one end and essentially diamond-shaped in cross-section at the other end reciprocating in the said sleeve, substantially as and for the purpose specified.

405,512. SASH-HOLDER. RALPH P. WADDELL, Alameda, Cal. Filed Feb. 26, 1889. Serial No. 301,549. (No model.)

Claim.—1. In a sash-lock, the combination of the spindle G, having the right and left hand threads g g', and fitted for rotation in the jamb of a window, and the clamps F F', mounted on the said spindle and adapted to engage the inner and outer sash, respectively, substantially as herein shown and described.



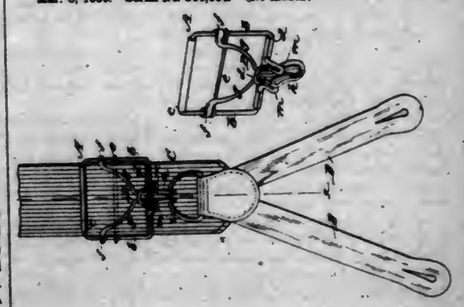
2. The combination, with the clamps F F' and the reversely-threaded spindle G, on which said clamps ride, of the many-sided collar h' on said spindle, the handle H, having hole h, corresponding to collar K, and receiving the collar and the nut A^3 on the spindle, substantially as shown and described.

405,513. AUTOMATIC SAFETY RAILROAD-SWITCH. JOHN H. WAIT, Junction City, Oreg. Filed Nov. 23, 1888. Serial No. 291,677. (No model.)

Claim.—1. The combination, with a main rail laterally movable at a point in its length and a parallel switch-rail attached thereto and movable therewith, of a stationary outwardly-curved main rail, an inner fixed guard-rail, and a rail-point intervening between the guard and fixed main rail at one end, substantially as shown and described.

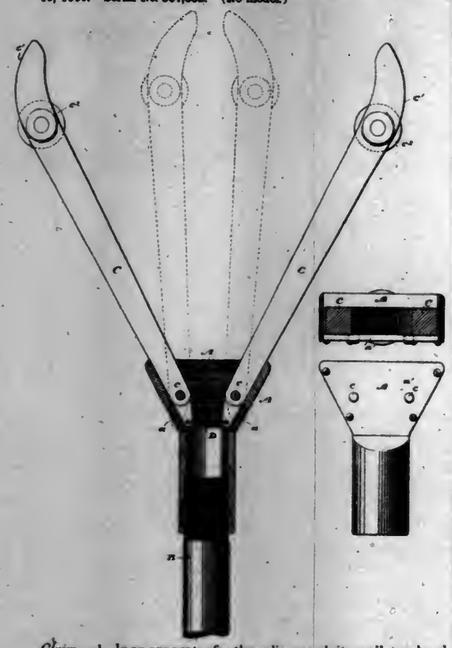
2. The combination, with a laterally-movable main rail and a parallel switch-rail attached thereto and movable therewith, of an outwardly-curved stationary opposing main rail, an inner guard-rail, a point-rail intervening between the guard and main rail at one end, and spacing-thimbles and bolts uniting the fixed main rail, the guard and point rail, substantially as and for the purpose specified.

405,513. [continued]



3. The combination, with a laterally-movable main rail and a parallel switch-rail spaced therefrom, attached thereto and movable therewith, of an outwardly-curved stationary opposing main rail, an inner guard-rail, a point-rail intervening between the main and guard rail at one end, spacing-thimbles and bolts connecting the stationary main rail, the point and guard rail, and the movable main rail and switch-rail, and means, substantially as shown and described, for manipulating the movable rails, as and for the purpose specified.

4. In a railroad-switch, the combination, with a curved fixed main rail and a fixed point-rail, of an opposing main rail laterally movable a distance in its length, and a parallel switch-rail movable with the latter main rail, substantially as shown and described.



5. In a railroad-switch, the combination, with a curved fixed main rail, a fixed point-rail, and opposing main rail laterally movable a distance in its length, and a switch-rail movable with the latter main rail, of a switch-stand connected with the movable rails, consisting of a spring-actuated signal-shaft, a frame supporting said shaft, a horizontal arm attached to said shaft, a lever fulcrumed upon said arm, a spring-actuated bolt capable of engaging with the horizontal arm, a crank-shaft connected with the bolt and the movable rail, and a direct connection between said movable rails and the signal-shaft, substantially as shown and described.

405,514. BUCKLE. WILLIAM J. WALTERS, Prospect, N. Y. Filed Mar. 5, 1889. Serial No. 301,884. (No model.)

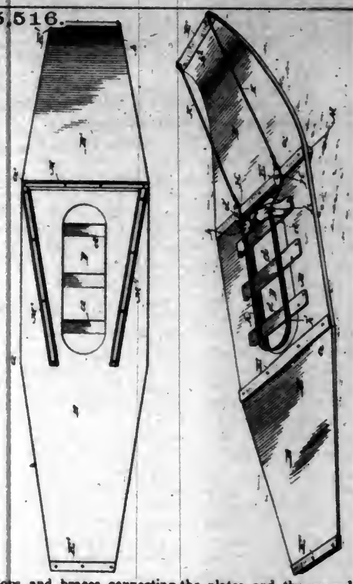
Claim.—The combination, with the suspender-buckle frame A, provided with side bars *b b*, a cross-bar *c*, secured to said side bars, an upper end bar *c*, and a lower end bar *d*, constructed to form downwardly and forwardly projecting separated stops or projections *m m*, of the clamp B, having ends *f f* adapted to slide on the side bars *b b* of the buckle-frame, and having bars *g g* passing over the cross-bar *c* and back of or through the lower end bar *d*, and constructed to form a hook *h* at the lower end of the clamp between the stops or projections *m m*, essentially as and for the purposes herein set forth.

405,515. PILOT OR HEAD FOR SECTIONAL RODS FOR THREADING UNDERGROUND CONDUITS. GEORGE H. WARDE, New York, N. Y., assignor to William Hampden Johnstone, Philadelphia, Pa. Filed Apr. 19, 1889. Serial No. 307,532. (No model.)

Claim.—1. In an apparatus for threading conduits, a pilot or head having spring-actuated jaws normally tending to open, substantially as and for the purpose set forth.

2. In an apparatus for threading conduits, the pilot or head having spring-actuated jaws tending to open and curved or bent inwardly at their forward ends.

3. In an apparatus for threading conduits, the pilot or head having spring-actuated jaws tending to open, curved inwardly upon their exterior faces near their forward ends, and provided with anti-friction rollers.



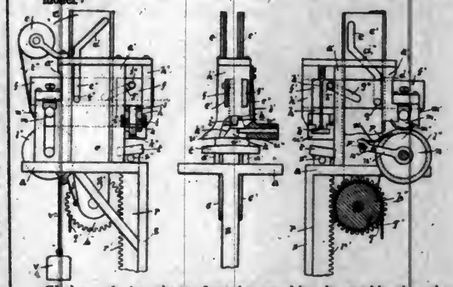
4. In an apparatus for threading conduits, the combination of the head A, the pivoted jaws mounted therein, and the screw-threaded shank of the head for connection with the leading-rod section, substantially as set forth.

405,516. SNOW-SHOE. HENRY WATSON, Donald, British Columbia, Canada. Filed Aug. 23, 1888. Serial No. 283,577. (No model.) Patented in Canada Apr. 26, 1888, No. 29,014.

Claim.—1. In a snow-shoe, the combination, with a wooden body provided with a central longitudinal opening, of flexible foot-supports spanning the opening and an adjustable toe-strap also spanning the said opening, substantially as shown and described.

2. In a snow-shoe, the combination, with a wooden body provided with a central longitudinal opening and flexible supports spanning the opening, of an adjustable toe-strap also spanning the said opening, containing loops, plates secured to the body, and heel-strings passing through said plates, and the loops of the toe-strap, substantially as shown and described.

3. In a snow-shoe, the combination, with a wooden body having an upwardly-curved forward end and provided with a central longitudinal opening, and flexible foot-supports spanning said opening, of an adjustable toe-strap also spanning said opening, containing loops, plates secured to said body, heel-strings passing through said plates



and loops, and braces connecting the plates and the curved end of the body, substantially as shown and described.

4. A snow-shoe having a central longitudinal opening in its body and provided with flexible foot-supports spanning said opening and with foot-securing straps, substantially as described.

5. The combination, with the body of a snow-shoe, of an essentially triangular brake attached to the bottom between the ends, substantially as shown and described.

6. The combination, with the body of a snow-shoe constructed of wood, of an essentially triangular wooden brake attached to the bottom of said body at the center, the members of said brake being polygonal in cross-section, substantially as shown and described.

405,517. HOOP-FASTENING MACHINE. FITZLAND L. WILSON, West Bay City, Mich. Filed May 7, 1888. Serial No. 273,014. (No model.)

Claim.—1. In a hoop-fastening machine, in combination, the supporting frame or standards, the vertical plate *c*, provided with a slot having a diagonal portion *d*, the horizontal plate *f*, provided with a rigid stud projecting into the said slot and with a diagonal slot *g* near its outer end, and the staple-driver *j'*, arranged to slide vertically and provided with a stud *j''*, projecting into the said slot *g*, substantially as and for the purpose set forth.

2. In a hoop-fastening machine, in combination, the supporting-standards, the vertical plate *c'*, provided with a longitudinal slot having a diagonal portion *d'*, the horizontal plate *f'*, provided with a rigid stud *g*, projecting into the said slot, and with a diagonal slot *g''* near its outer end, with a former-head *h*, capable of a vertical movement and provided with a rigid stud *h''*, projecting into the said slot *g''*, and having on its lower end the projecting portions *i'* and *i*, a staple-forming die *k*, and the staple-driver, substantially as set forth.

3. In a hoop-fastening machine, the combination, with the staple forming and driving mechanism, the fixed roll and the opposing roll, and a ratchet-wheel coincident with and secured to the fixed roll, of the lever *n'*, pivotally supported by one end and provided on its free

end with a fork *n''*, a pawl, as *p*, pivoted to the lever and engaging with the ratchet-wheel, and the vertically-sliding plate *c*, provided with a fixed stud engaging with the said fork *n''*, substantially as and for the purpose set forth.

4. In a machine for fastening hoops, the combination, with the supporting-frame, the vertical plate *c'*, capable of a vertical movement and provided with a slot having the diagonal portion *d''* and the vertical portions *d'* and *e*, the horizontal plate *f''*, provided with a stud *g*, projecting into the said slot and having the diagonal slot *g''*, and the head *h*, capable of a reciprocating movement and provided on its lower end with staple-forming devices and upon its front side with a vertical groove *j*, of the plate *c*, capable of a vertical movement, and provided with the slot *c''*, having the diagonal portion *d*, the plate *f*, provided with a stud *f''*, projecting into the said slot *c''*, and having the diagonal slot *g'*, the vertical driver *j'* within the said groove *j*, and provided with the stud *j''*, projecting into the said slot *g'*, the former-die *k*, and the anvil-die *l*, substantially as and for the purpose set forth.

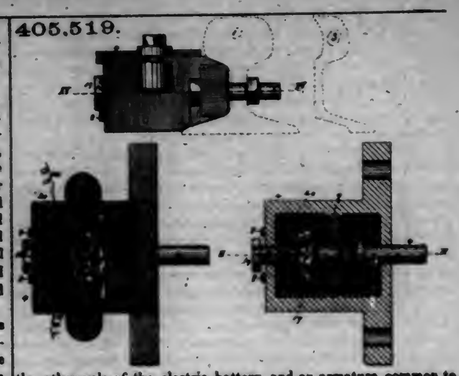
5. In a hoop-fastening machine, the combination, with the plates *c* and *c'*, capable of a vertical movement for actuating the staple forming and driving devices, of the gear-wheel *b''*, journaled between the said plates and provided on its periphery with a line connected to a foot-lever, the vertical rack-bar *r*, provided with teeth engaging with the said gear-wheel, and having the anvil-die *l*, pivotally secured to its upper end, and clamping-supports, as *u'* and *u''*, above the anvil-die, substantially as set forth.

6. The combination, with the staple forming and driving mechanism for fastening hoops, of the fixed roll, the opposing roll, a ratchet-wheel secured to and coincident with one of the said rolls, a lever having a pawl engaging with the said ratchet, and suitable devices for operating the said lever to intermittently revolve the said roll with the rigidly-supported cutter *l*, and the cutter *l'*, secured to the vertically-sliding former-head, substantially as set forth.

7. The combination, in a hoop-fastening machine, with the staple-driver, the former-die *k*, capable of a receding movement horizontally, and a vertically-sliding former-head provided with devices for moving the said former-die horizontally after the staple is formed, and having on its lower end downwardly-projecting portions passing on each side of the said former-die, of the cutter *l*, secured to the side of the former-head, and with its cutting-edge projecting below the said downwardly-projecting portion, and a fixed cutter *l'*, secured to the machine-frame, substantially as and for the purpose set forth.

8. The combination, in a hoop-fastening machine, of the driver, the vertically-reciprocating former-head having on its lower end downwardly-projecting portions *i* and *i'*, and a beveled portion *w*, the former-die *k*, having a projecting beveled end *k''*, and provided with the projections *w''*, engaging with the portion *w* when the former-head is near the end of its downward movement, and a spring *k'*, for retaining the said former-die in position, substantially as set forth.

405,518. BAG-FASTENER. ROBERT WILSON, Grubville, Mo. Filed Feb. 12, 1889. Serial No. 299,588. (No model.)

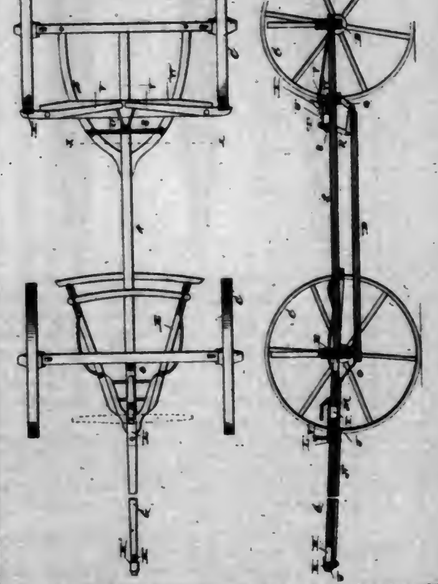


Claim.—The herein-described bag-fastener, comprising two flat members C D, lying in the same plane with their adjacent edges recessed and their inner rear corners rounded, apertures being formed in their rear ends, the rectangular link E, the opposite cross-bars of which extend one through each of said apertures to connect the two members, and a fastening turning on the forward end of one member and locking the front end of the opposite member thereto, substantially as set forth.

405,519. ELECTRIC APPLIANCE FOR RAILWAY-SWITCHES. MORRIS WERNER, St. Louis, Mo. Filed Apr. 30, 1888. Serial No. 272,353. (No model.)

Claim.—1. The combination of the two moving rails of a railroad-switch, a block 7, moved by each rail into contact with another block 12, wires connecting both of the blocks 12 with one pole of a galvanic battery, wires connecting the blocks 7 with the coils of different electro-magnets, both of which have electric connection with

405,519.

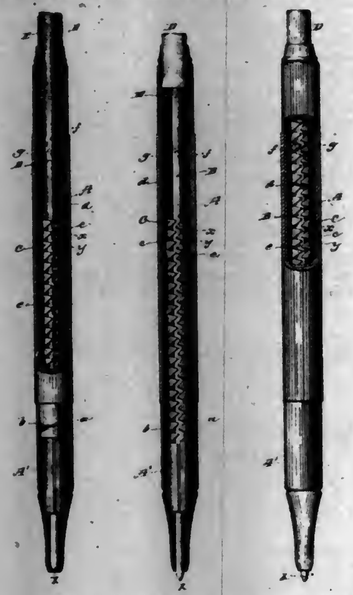


the other pole of the electric battery, and an armature common to both magnets and connected with an indicating-finger, all arranged so that the circuit will be closed whether the switch is open or closed, and thus show by means of an indicating device the position of the switch-rails, substantially as and for the purpose set forth.

2. In a circuit-closer for railway-switches, the combination of the rod 6, carrying at its inner end insulated block 7, having electrical connection with one pole of a galvanic battery and signaling device, a second rod 13, carrying insulated block 12, having electrical connection with the other pole of the galvanic battery, both blocks 7 12 having their contact faces formed with matching teeth or ribs 17 for increasing their contact-surfaces, a movable switch-rail adapted to place the insulated blocks 7 12 into electrical connection, a spring on rod 6 for keeping the blocks normally separated, and a spring on rod 13 for affording a yielding contact, whereby the exact position of the switch-rails is constantly shown by the signaling device, as set forth.

3. In a circuit-closer for railway-switch signals, the combination of a box, the two terminals of the signal-circuit, the blocks 7 12, connected to the respective terminals, the rods 6 13, carrying said blocks and mounted in the box-springs on said rods, and guide-rods 8 on which the blocks slide, said rod 6 protruding for contact with the rail, all substantially as herein set forth.

405,520. AUTOMATIC WAGON-BRAKE. WILLIAM AYLESWORTH, Ist, Hossburg, Pa., assignor of one-third to James H. Mold, same place. Filed Jan. 10, 1889. Serial No. 296,009. (No model.)



Claim.—1. In an automatic wagon-brake, the combination, with the running-gear, of the tongue having longitudinal slots near its front

and rear ends, the plate arranged to slide in the rear slot, the bracket secured to the upper edge of said plate, the horizontal plate secured to the lower edge of the latter and having a forwardly-extending rod connected with a pin sliding in the front slot of the tongue and carrying the neck-yoke, and the angular link hinged at the rear end of the horizontal sliding plate and connected by intermediate mechanism with the brake-levers, substantially as set forth.

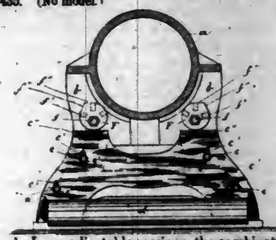
2. The combination, with the tongue having the slot I, of the vertical plate J, sliding longitudinally in said slot, the bracket secured permanently at the upper edge of said plate and adapted to carry the whiffletrees, the horizontal plate M, secured permanently at the lower edge of said plate and having the forwardly-extending rod N, connected with the neck-yoke, a link hinged to the rear end of the horizontal sliding plate M and connected by intermediate mechanism with the brake-levers, and a pin adapted to be inserted detachably through a perforation in the bracket L into the tongue, substantially as set forth.

3. The combination, with the running-gear and the tongue, of the levers mounted on the running-gear and carrying the brake-shoes, the rock-shaft mounted on the running-gear in front of the levers and having an upwardly-projecting arm T, the links connecting said arm with the levers, the parallel arms R, depending from the rock-shaft, the angle-levers pivoted at one end to the running-gear and at the other end to the arms R, the push-bar pivoted between the angle-levers, and devices mounted on the tongue to operate the push-bar, as set forth.

405,521. LEAD OR CRAYON HOLDER. MARCELLUS BAILEY, Washington, D. C., assignor to the Eagle Pencil Company, New York, N. Y. Filed Dec. 14, 1888. Serial No. 293,563. (No model.)

Claim.—1. The combination of the pencil sheath or handle, the straight-slotted tube B, the zigzag slotted tube C, the one rotatable within certain limits with respect to the other, the spring whereby the rotatable tube is caused to move in a direction opposite to that in which it is moved by hand, and the carrier provided with a pin which enters both the straight slot of tube B and the zigzag slot of tube C, substantially as and for the purposes hereinbefore set forth.

2. The combination of the pencil-sheath or handle, the carrier, the straight-slotted tube B, and the zigzag-slotted tube C, the one rotatable with respect to the other, the longitudinally-movable pressure-cap connected to the rotatable tube in such manner that its longitudinal reciprocation shall cause oscillatory movement of the rotatable tube, and the retracting-spring, these elements being combined for joint operation substantially in the manner hereinbefore set forth.



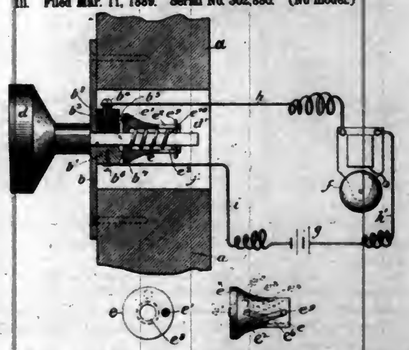
405,522. BIT-HOLDER. HARRY S. BARTHOLOMEW, Bristol, Conn. Filed Feb. 5, 1889. Serial No. 298,706. (No model.)

Claim.—The combination of the transversely-slotted head or socket exteriorly threaded, the holding-jaws resting in the slot of said socket, and the inner and outer sleeves fitted to each other and to said head or socket with differential threads at the exterior and interior of the inner socket, substantially as described, and for the purpose specified.

405,522.

405,523. ADJUSTABLE CARRIAGE FOR JORDAN ENGINES AND OTHER MACHINERY. EDWIN W. BARTON, Lawrence, Mass., assignor of one-half to Edwin Churchill, same place. Filed Jan. 4, 1888. Serial No. 295,435. (No model.)

Claim.—1. In an adjustable carriage, the combination of the legs or supports *b b*, bolts or spindles *f f*, secured thereto, cams or eccentries F F, journaled on the spindles, plates *c c*, having rollers *d d*, and means for adjustably securing the plates to the supports, substantially as and for the purpose set forth.

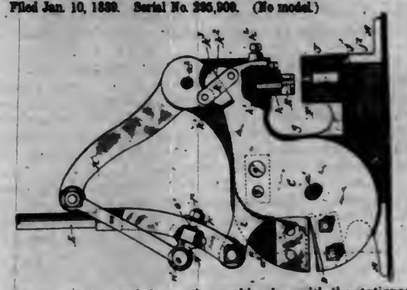


2. In an adjustable carriage, the combination of the legs or supports *b b*, bolts or spindles *f f*, secured thereto, cams or eccentrics F F, journaled on the spindles and having flattened surfaces *f' f'* and peripheral recesses *f'' f''*, as described, plates *c c*, having rollers *d d*, and means for adjustably securing the plates to the supports, substantially as and for the purpose set forth.

405,524. WHIP-SOCKET. FRANCIS E. BENTON, Stoughton, Mass. Filed Nov. 17, 1888. Serial No. 291,124. (No model.)

Claim.—A whip-socket holder consisting of the two parts A A, having jaws *a a* and intermediate rib a^3, the screws E E, and the plates D D, the latter held with respect to each other by the said screws and their nuts F, as shown and described.

405,525. ELECTRICAL BELL-PULL. CHARLES A. BRAUN, Chicago, Ill. Filed Mar. 11, 1889. Serial No. 302,880. (No model.)



Claim.—1. In combination with an electric circuit, electric bell, bell-pull, and insulated contact-point to one end of said circuit, a transversely-reciprocating spring-chamber provided with an insulating-plug operating with said insulated contact-point, whereby, by operating said bell-pull, the electric circuit may be opened and closed, substantially as specified.

2. In combination with a reciprocating spring-chamber provided with an insulating-plug, spiral slots, and a spring, a bell-pull provided with a pin operating in said slots, an insulated contact-point at one end of an electric circuit operating with said insulating-plug, and an electric bell adapted to operate substantially as specified.

3. In combination with a spring-chamber provided with an insulating-plug, spiral slots, and a spring, all upon the shaft of a bell-pull, a bell-pull shaft provided with a pin adapted to play in said spiral slots, an insulated contact-point at one end of an electric circuit, said circuit provided with an electric bell, and said insulating-plug adapted to operate with said insulated contact-point, substantially as specified.

405,526. METAL-SHEARS. PETER BROADBOOKE, Batavia, N. Y. Filed Jan. 10, 1889. Serial No. 295,900. (No model.)

Claim.—1. In metal-shears, the combination, with the stationary frame provided at one end with an upper stationary cutter or jaw, of an oscillating lever-frame pivoted between its ends to the stationary frame and carrying at one end a lower movable cutter or jaw co-operating with the stationary jaw of the frame and at its opposite end a punch or other cutting-tool, a cam-lever pivoted to the stationary frame, whereby said oscillating frame is swung on its pivot, and an actuating-lever connected with said cam-lever, substantially as set forth.

2. In metal-shears, the combination, with the stationary frame composed of upright parallel side plates and having a punching-die at one end and an upper stationary shearing-jaw at its opposite end, of an oscillating frame pivoted between the stationary side plates of the main frame and carrying at one end a lower movable cutting-jaw arranged opposite said stationary jaw, and at its opposite end a punch arranged above said punching-die, a cam-lever arranged above one end of said oscillating frame for swinging the latter on its pivot, and an actuating-lever connected with said cam-lever, substantially as set forth.

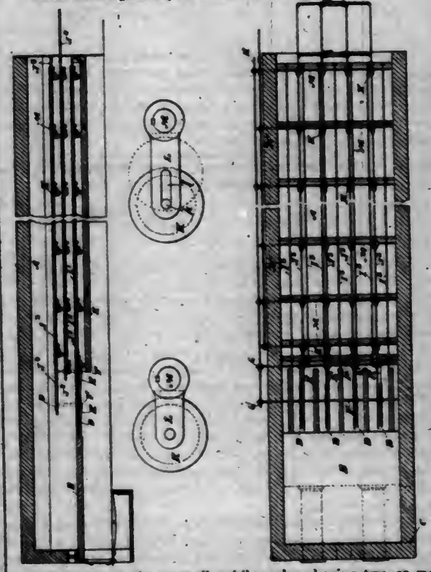
3. In metal-shears, the combination, with the stationary frame composed of upright parallel side plates and having a punching-die at one end and an upper stationary shearing-jaw at its opposite end, of an oscillating frame pivoted between the stationary side plates of the main frame and carrying at one end a lower movable cutting-jaw arranged opposite said stationary jaw, and at its opposite end a punch arranged above said punching-die, a cam-lever pivoted to the stationary frame and connected with one end of said oscillating frame, and an actuating-lever pivoted to the opposite portion of the oscillating frame and connected with said cam-lever, substantially as set forth.

4. In metal-shears, the combination, with the stationary frame composed of upright parallel side plates and having a punching die at one end and an upper stationary shearing-jaw at its opposite end, of an oscillating frame pivoted between the stationary side plates of the main frame and carrying at one end a lower movable cutting-jaw arranged opposite said stationary jaw, and at its opposite end a punch arranged above said punching-die, a cam-lever pivoted to the stationary frame and engaging against one end of said oscillating frame, an actuating-lever, and a connecting link or links attached at one end to said cam-lever and adjustably connected at their opposite ends to the actuating-lever, substantially as set forth.

5. In metal-shears, the combination, with the stationary frame composed of upright parellel side plates and having a punching-die at one end and an upper stationary shearing-jaw at its opposite end, of an oscillating frame pivoted between the stationary side plates of the main frame and carrying at one end a lower movable cutting-jaw arranged opposite said stationary jaw, and at its opposite end a punch arranged above said punching-die, a cam-lever pivoted to the stationary frame and engaging against one end of said oscillating frame, a bifurcated actuating-lever L, links *m*, attached at one end to said cam-lever, and a clamp N, connecting the opposite ends of said links with the actuating-lever, and consisting of a block *n*, having a bearing for receiving the connecting-bolt of said links, and a screw-shank *o*, provided with a clamping-nut *p*, bearing against said actuating-lever, substantially as set forth.

6. In metal-shears, the combination, with the stationary frame composed of side plates $A' A^2$, and having at one end a stationary cutting-jaw B and at its opposite end a punching-die F, of the oscillating frame C, pivoted between said side plates and carrying at one end a jaw D and at its opposite end a punch E, the cam-lever K, a link or links *k*, connecting said cam-lever with the oscillating frame, the actuating-lever L, and the link or links *m*, connecting said actuating-lever with the cam-lever K, substantially as set forth.

7. In metal-shears, the combination, with the stationary frame composed of side plates $A' A^2$, and having at one end a stationary cutting-jaw B and at its opposite end a punching-die F, of the oscillating frame C, pivoted between said side plates and carrying at one end a jaw D and at its opposite end a punch E, the cam lever K, the sliding block J, interposed between said cam-lever and the oscillating frame, links *k*, connecting the cam-lever and oscillating frame, and the actuating-lever L, connected with said cam-lever, substantially as set forth.



8. In metal-shears, the combination, with the stationary frame having an upper stationary cutting-jaw, of a lower movable jaw and a rest or support arranged underneath the upper stationary jaw and opposite the lower movable jaw, substantially as set forth.

9. In metal-shears, the combination, with the stationary frame having an upper stationary cutting-jaw, of a lower movable jaw and a vertically-adjustable rest or support arranged underneath the upper stationary jaw and opposite the lower movable jaw, substantially as set forth.

10. In metal-shears, the combination, with the stationary frame composed of side plates $A' A^2$, the plate A' being provided at one end with an overhanging portion a^3, carrying an upper stationary jaw B, of the oscillating frame C, carrying a lower movable jaw D, and a rest or support *d*, arranged underneath said overhanging portion of said side plate and opposite the movable jaw, substantially as set forth.

11. In metal shears and punch, the combination, with the base A, divided longitudinally and provided with side plates $A' A^2$, having a dovetailed recess between them, of the die-holder J, provided with a dovetail rib or tenon arranged in said dovetail recess, and a clamping-bolt, whereby said side plates are secured together and the die-holder is clamped between the plates, substantially as set forth.

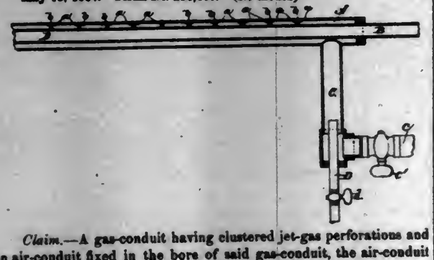
405,527. ANNEALING-KILN. ANTHONY D. BROGAN and JAMES CRAIG, Firhill, Glasgow, County of Lanark, Scotland, and JOSEPH FERSON, St. Paul, Minn. Filed Mar. 27, 1888. Serial No. 268,618. (No model.) Patented in England Sept. 15, 1887, No. 12,548.

Claim.—1. A glass-annealing kiln or lear having two or more tiers of depositing-surfaces arranged one above another, in combination with means, such as an elevator and traveling or transferring bars, for laying the glass on any of said surfaces, and stops for locking said elevator at any of said tiers, substantially as described.

2. The combination, in a glass-annealing kiln or lear, of two or more tiers of depositing-surfaces, composed of stationary and traveling bars, and an elevator or grid capable of being raised and lowered to the level of any of said depositing-surfaces, substantially as set forth.

3. The combination, in a glass-annealing kiln, of two or more glass-depositing shelves arranged one above the other in the kiln and movable longitudinally independent of each other, an elevator ar-

ranged at the end of said surfaces or shelves to convey the glass to any of said surfaces or shelves, a lever for operating said elevator, and a quadrant having a number of stops equal to the number of shelves or surfaces, substantially as set forth.



4. In a glass-annealing kiln or lear, the combination of a lifting grid or elevator D, the stationary glass-supporting bars I' I² I³, arranged longitudinally in said kiln, and the traveling bars J' J² J³, arranged parallel with and slightly below said stationary bars and adapted to be projected under said grid, said stationary and traveling bars being arranged in a vertical tier, substantially as set forth.

5. In a glass-annealing kiln or lear having traveling bars, the lever-arms K, formed with slots or long bearings to carry the pulleys supporting said bars, substantially as and for the purpose set forth.

6. In a glass-annealing kiln, the combination, with a tier of shelves, of the rock-shafts F, arranged at the ends and slightly below the level of the bottom shelf, the bars D, arranged in pairs across said shafts, arms G, and the link connecting said arms, lever-arms E on said shafts, pivoted between said bars D, and mechanism, substantially as described, for locking said elevator at the level of any of said shelves, as set forth.

7. In a glass-annealing kiln, the combination, with a tier of shelves, of the rock-shafts arranged at the end and slightly below the bottom shelf, the bars D, arranged in pairs, supported across said rock-shafts, parallel lever-arms E, secured to said rock-shafts and pivoted at their ends between the ends of the said bars D, crank-arms G on said shafts, a link connecting said arms G, and a bell-crank lever H, connected to said link, substantially as set forth.

405,528. BLOW-PIPE. WALTER M. BROWN, Albany, N. Y. Filed May 13, 1887. Serial No. 238,109. (No model.)

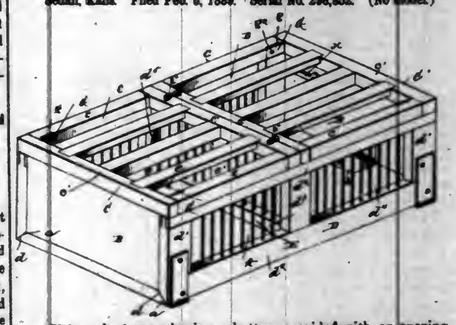
Claim.—A gas-conduit having clustered jet-gas perforations and an air-conduit fixed in the bore of said gas-conduit, the air-conduit having hollow nipples leading from the interior of said air-conduit and passing through the shell of the gas-conduit, the exit ends of said hollow nipples terminating within the space formed by said clustered gas-perforations, substantially as described.

405,529. BUTTON. CHARLES A. BRYANT, Wakefield, Mass. Filed Apr. 1, 1889. Serial No. 305,502. (No model.)

Claim.—1. The herein-described button consisting of a front and back united at their edges, but so as to leave a chamber between the two, combined with a pair of springs arranged in the said chamber, secured by their outer ends to said front and back, the said springs extending radially inward and inclined toward the back, their inner or free ends overlapping each other at the center, the said free ends and back constructed with openings corresponding to the shank to be introduced, the said openings in the springs overlapping each other at the center, and whereby as the said free ends are forced toward the front of the button the openings through the springs will be caused to register with each other, and a stud the shank of which is constructed with an annular groove and adapted to enter the back of the button and through the openings in the free ends of the springs, and engaged with said free ends by the reaction of the springs, substantially as described.

2. A button composed of a front A and a back B, the said front and back secured together at their outer edges, and so as to form a chamber between the two, the back constructed with an opening C at its center, combined with springs E F, made from elastic sheet metal and integral with the body G, which said body forms connection between the said two springs, the said springs arranged within the button, with the body G next the front of the button and so that the springs incline rearward toward the back of the button, the free ends of the springs overlapping each other at the center, and the said free ends constructed with openings corresponding to the shank of the stud to be introduced, the said openings overlapping each other in their normal condition, but so that when forced toward the front the said two openings will register the one with the other, and a stud the shank of which is constructed with an annular groove e, adapted to engage said springs, substantially as described.

405,530. ROCKING-CHAIR ATTACHMENT. WILLIAM I. BUNKER, Chicago, Ill. Filed Sept. 9, 1887. Serial No. 249,270. (No model.)



Claim.—1. In combination with the rocker and base-rail of a platform rocking-chair, a coiled spring and two attaching-brackets securing the ends of the spring to the rocker and base-rail, respectively, one of the brackets securing one end of the spring at points away from its diametrical center and the other bracket securing the other end of the spring at a point substantially in the line of its diametrical center, substantially as described.

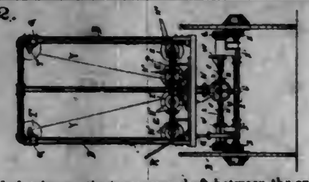
2. In combination with the rocker and base-rail of a platform rocking-chair, a helical spring and two attaching-brackets securing the ends of the spring to the rocker and base-rail, respectively, one of the brackets securing the larger end of the spring at points away from its diametrical center and the other bracket securing the smaller end of the spring at a point substantially in the line of its diametrical center, substantially as described.

3. In combination with the rocker and base-rail of a platform rocking-chair, a helical spring and two attaching-brackets, one of the brackets securing the broader end of the spring at points away from its diametrical center and the other bracket having an extended portion passing through the body of the spring, attached to its tapering end, and securing the same from a point substantially in the line of its diametrical center, substantially as described.

4. A bracket for rocking-chair attachments, comprising a plate to be secured to the rocker or base-rail, an extended portion to pass through the body of the coils, and means for securing the end of the extended portion to one of the terminal coils of the spring, substantially as described.

405,531. FOLDING COOP. WILLIAM CARR and ALFRED EVANS, Sedan, Kans. Filed Feb. 6, 1889. Serial No. 298,852. (No model.)

Claim.—1. A coop having a bottom provided with an opening, sides hinged to said bottom, ends and top hinged together, a partition carrying a block having shoulders which extend through the opening in the floor, and cleats pivoted to the ends of the shoulders to retain the coop when folded, substantially as described.

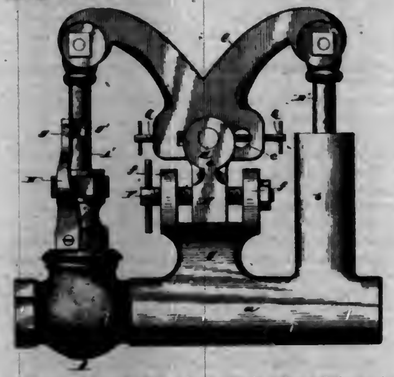


2. A folding coop consisting of a bottom, sides, ends, and top, a partition on said bottom, cleats on the sides in which said partition fits, and a block carried by said partition having cleats for fastening the coop in folded position, substantially in the manner described.

3. In a folding coop, the combination of the bottom, sides, ends, and top, the bottom having an opening therein, the partition on said bottom, the guides on the bottom for said partition, and the block in the partition extending through the bottom and having cleats for securing the coop when folded, substantially in the manner described.

405,532. MODE OF ADVERTISING. JAMES A. CHERNEY, Los Angeles, assignor to James W. Moyle, San Francisco, Cal. Filed Feb. 12, 1889. Serial No. 299,663. (No model.)

Claim.—1. The combination of a running-gear, a frame mounted thereon, apron-carrying rolls mounted at bottom and top of the frame, gears at the front end of the bottom rolls, a shaft geared thereto and extending to the rear axle, a transverse shaft over said axle carrying center gears to which the longitudinal shaft is geared, gears at the ends of said transverse shaft and gears on the rear hubs of the running-gear, and clutches on the transverse shaft between the end gears and the center gears to cause the engagement and disengagement of the center gears, as described.



405,532.

2. The combination of a running-gear, a frame mounted thereon, a transverse shaft on the forward end of said frame carrying movable bevel-gears, and a shipper for operating said gears, two pairs of rolls mounted in the frame and having bevel-gears on their forward ends, the movable gears being adapted to engage alternately one or the other of each pair of bottom rolls, idler-rolls at the top of the frame, and traveling aprons each running over one pair of bottom rolls and one top roll, as set forth.

3. The combination, with the wheels of a vehicle having gears S S upon them, and a shaft U, having gears G G, and clutches W W, provided with springs X X, and a gear L upon it, of the gear V, meshing in gear Z, yoke H, and bracket U, supporting-gear V, couplings I I, shaft J M, leading from gear V to forward end of vehicle, shaft O, operating from shaft M, and shaft P, operated from shaft O, and rolls for the canvas operated from shaft P, as set forth.

405,533. REDUCTION-VALVE AND PRESSURE-REGULATOR. PETER D. CONNERLY, Horseheads, N. Y. Filed Feb. 9, 1889. Serial No. 299,233. (No model.)

Claim.—1. The reduction-valve having its valve and plunger beam or lever provided with a slot which receives the pivot or fulcrum, and upon which pivot or fulcrum bear handle-screws working in said lever or beam, said pivot or fulcrum being carried by a block or slide, in turn carried by a lever-screw bearing in an extension of the pressure-pipe, substantially as and for the purpose set forth

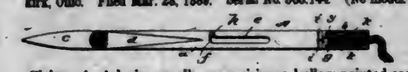
2. The reduction-valve having applied to its stem a beveled incline-faced projection, in combination with the spring-catch having at the upper end a similar projection engaging with the aforesaid projection, substantially as and for the purpose specified.

405,534. HARROW. JOHN F. CORRELL and RANNER A. A. CORRELL, York, Pa. Filed Oct. 8, 1888. Serial No. 287,473. (No model.)

Claim.—1. The combination, with the rails, of a plate for holding the same intact, the under side of which is provided with two downward-extending shoulders designed to fit around the rail, and a diagonal slot in which the spring-finger fits, substantially as described.

2. The combination, with the plate, the under side of which is provided with two downward-extending flanges designed to fit around the rails, and having a diagonal slot cut therein in which the spring-finger of the rail fits, of two flanges formed on its upper side and having two lugs formed between the flanges which are designed to engage the rails of the harrow to prevent the same from working loose, substantially as described.

405,534.

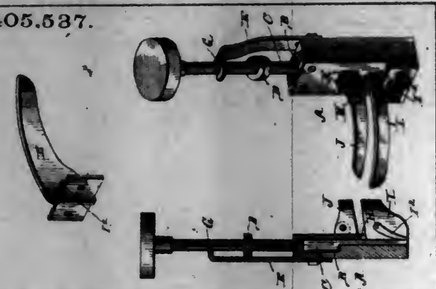


405,535. CAR-STARTER. AMBROSE M. CRADDICK and WINFIELD S. HEADY, Tower Hill, Ill. Filed Mar. 1, 1889. Serial No. 301,673. (No model.)

Claim.—The car-starter consisting of the handle or lever A, having at one end the curved plates or bars A', the serrated roller D, having at one end a ratchet E' integral therewith, the roller B, hung at the forward ends of the plate or bars A, and the pawl E, engaging said ratchet, which pawl and serrated roller, with its ratchet, are hung in the plates or bars A', substantially as set forth.

405,536. BELT-LACING NEEDLE. BENJAMIN F. CURRAN, Dunkirk, Ohio. Filed Mar. 23, 1889. Serial No. 305,144. (No model.)

Claim.—1. A lacing-needle, comprising a hollow-pointed section having a bayonet-slot formed longitudinally therein and its sides reduced in rear of its point portion, and a sliding section composed of two spring clamping-jaws, adapted to move in the hollow section and carrying a stud to move in the bayonet-slot, and having its rear end formed with teeth and adapted to receive between them a lacing-cord, substantially as specified.



2. In a lacing-needle, the combination, with a pointed hollow section having a bayonet-slot formed therein, of a section formed with two spring-jaws adapted to slide in the hollow section and carrying a stud traveling in the said bayonet-slot, the jaws being adapted to receive a lacing-cord, substantially as specified.

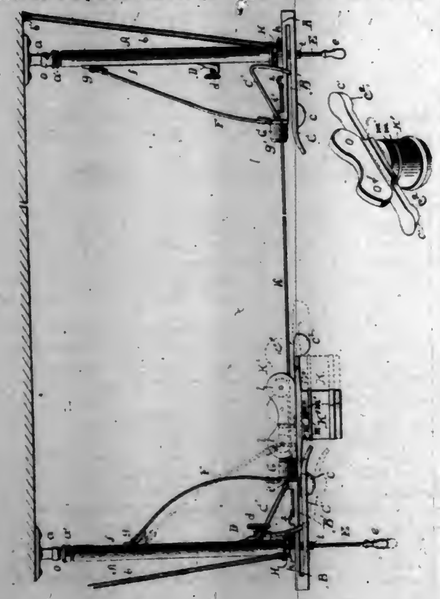
405,537. STAPLE-DRIVER. EMIL M. DEAN, Alta, Cal. Filed Feb. 15, 1888. Serial No. 300,047. (No model.)

Claim.—1. The combination of the body having a longitudinal slot in its lower end, the driving-rod working in the body, the curved rack secured to the body and having its end entering the slot in the body, and the curved staple-holder pivoted to the body adjacent to and above the rack, as set forth.

2. The combination of the body having a longitudinal slot in its lower end, the driving-rod working in the body, and the rack having its end entering the longitudinal slot in the body and provided with

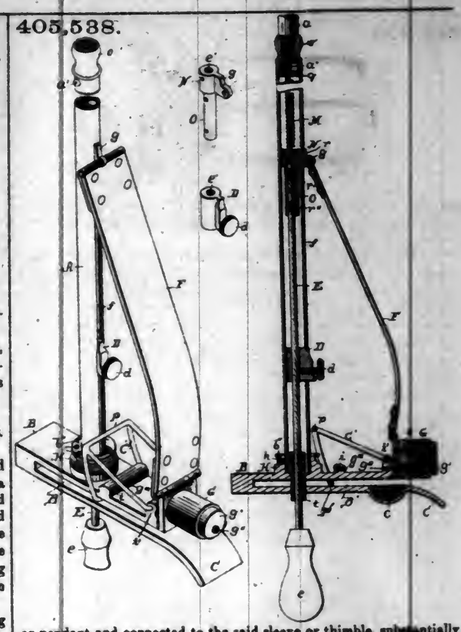
405,537.

the curved ribs on its sides and with lateral flanges through which securing-screws are passed into the body, as set forth.



3. The combination of the body, the driving-rod working therein, and the guide-rack secured to the lower end of the body and entering the same and having the downwardly and inwardly curved ribs on its sides at its inner end, as set forth.

405,538. CASH-CARRIER. WILLIAM R. DEAN, Ottawa, Kans. Filed Feb. 27, 1889. Serial No. 301,320. (No model.)



Claim.—1. In a cash-carrier, the combination, with a slotted support or pendant, of a sliding sleeve or thimble suspended from a spring within said support or pendant and having an operating-cord connected thereto, the flat spring pivoted or hinged at its upper end to said sleeve or thimble and carrying a buffer on its lower end, the catcher or retainer provided with a spring-arm, the tripping device having one arm resting on the said spring-arm, and the car having arms provided with projections to engage the cavity or chamber in said spring-arm, substantially as specified.

2. In a cash-carrier, the combination, with the outward flexing or bowing spring, the slotted catcher and retainer having a lower spring-arm, the operating rope or cord carrying a projection or head, and the car having arms engaging and held by said spring-arm of the catcher and retainer, of the compound bail-lever or tripping device having one cross-bar pivoted in the latter, a second cross-bar arranged in the path of the movement of the projection on the operating-cord, and a third cross-bar arranged in the slot of said catcher and retainer and pressing or resting upon said spring-arm, substantially as set forth.

3. In a cash-carrier, the combination, with a tubular longitudinally-slotted support or pendant carrying catching and tripping devices and having one end of the track or rail connected thereto, of a sliding sleeve or thimble suspended from a contractile spring within the support or pendant, the propelling-spring connected to and carried by said sleeve or pendant, and the operating-cord inclosed in the support

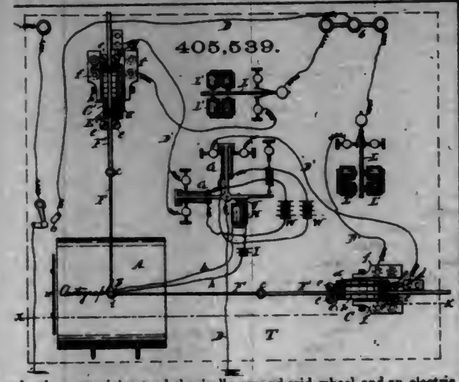
405,538.

or pendant and connected to the said sleeve or thimble, substantially as specified.

4. In a cash-carrier, the combination, with a tubular slotted support or pendant carrying catching or tripping devices, of the sliding sleeve or thimble suspended from a spring within the support or pendant, the propelling-spring connected to said sleeve or thimble, the guide-tube located concentrically at the lower end of the support or pendant, and the operating-cord passing through said guide-tube and connected to the sleeve or thimble, substantially as specified.

5. In a cash-carrier, the combination, with the support or pendant having the end of the track or rail connected thereto and carrying suitable catching and tripping devices, of the sliding sleeve or thimble mounted in the support or pendant and having an operating-cord connected thereto, and the flat propelling-spring connected at its upper end to said sleeve or thimble and carrying a buffer on its lower end which slides on and is guided by the track or rail, whereby said buffer moves parallel with said track, substantially as specified.

6. In a cash-carrier, the combination, with the track connected to suitable supports or pendants and the sliding sleeve or thimble having an operating-cord connected thereto, of the movable buffer provided with a tube or passage arranged longitudinally therein to slide on the track and guide the buffer, and the flat propelling-spring connected at one end to the sleeve or thimble and at the other end to the buffer, substantially as specified.



7. In a cash-carrier, the combination of a sliding sleeve or thimble having an operating-cord connected thereto, the track or rail, a suitable car running thereon, the flat propelling-spring hinged or pivoted at its upper end to the sleeve or thimble, and the buffer guided on said track or rail and hinged or articulated to the lower end of the propelling-spring, substantially as specified.

8. In a cash-carrier, the combination of the tubular support or pendant, the longitudinally-slotted catcher or retainer provided with a lower spring-arm and having a sleeve or socket on its upper side to fit on the lower end of the support or pendant, the cable or rail fitting in eyes on the upper side of the catcher or retainer, the sleeve or thimble suspended from a coiled spring within the support or pendant and having an operating-cord connected thereto, and the flat propelling-spring connected at its upper end to the said sleeve or thimble and carrying a buffer on its free end, which slides on the track or rail, substantially as and for the purpose specified.

405,539. AUTOGRAPHIC TELEGRAPHY. MARK W. DEWEY, Syracuse, N. Y., assignor, by direct and mesne assignments, to the Dewey Corporation, same place. Filed Sept. 22, 1888. Serial No. 286,098. (No model.)

Claim.—1. In combination with the manipulative instrument and a rod carrying said instrument, a rotary variable resistance operated by the said rod and consisting of a wheel and a path of semi-conducting material extended spirally around said wheel, and an electric contact riding on said semi-conducting material, as set forth.

405,539.

2. In combination with the manipulative instrument and two longitudinally-movable rods disposed at an angle to each other and carrying conjointly at one end the aforesaid instrument, rotary resistances operated, respectively, by the aforesaid rods, and each of said resistances consisting of a wheel, a path of semi-conducting material extending spirally around said wheel, and an electric contact riding on said semi-conducting material, substantially as set forth.

3. In combination with the manipulative instrument, a rotary resistance consisting of a wheel, a path of semi-conducting material extended spirally around said wheel, an electric contact riding on said semi-conducting material, a longitudinally-movable rod turning the said wheel, and a supplemental rod connected at one end to the reciprocating rod by a universal joint and carrying on its opposite end the aforesaid instrument, as set forth.

4. In combination with the manipulative instrument, a rotatable resistance, a pinion moving synchronously with said resistance, a rack engaging the pinion, and a rod connected at one end to said rack by a universal joint and carrying on its opposite end the aforesaid instrument, substantially as specified and shown.

5. In combination with the manipulative instrument, a rheostat or variable resistance consisting of a path of semi-conducting material presenting gradually-increasing in contradistinction of step-by-step resistance to the current of an electric circuit, an electric conductor arranged movably on said path, and two rods coupled together by universal joint and connected at one end to the manipulative instrument and operating by the opposite end the aforesaid rheostat or variable resistance, as described.

6. In combination with the manipulative instrument and two longitudinally-movable rods disposed at right angles to each other and carrying conjointly at one end the aforesaid instrument, racks connected, respectively, to said rods by universal joints, pinions engaging the racks, and rotatable resistances each moving synchronously with one of the pinions, substantially as described and shown.

7. The combination, with the main-line circuit, branches of said circuit, and batteries, of reeds or electrotomes in said branches, the stylus or pen, rods arranged at angles to each other and movable conjointly and universally and carrying conjointly at one end the aforesaid stylus or pen, and variable rotary resistances connected with said rods and controlled by the movement of said rods and included in the aforesaid branches, substantially as set forth.

8. The combination, with an electric circuit and a manipulative instrument, of two reeds or electrotomes, two rheostats each consisting of a path of semi-conducting material presenting an evenly-progressive increasing resistance to the electric current, electric conductors traveling, respectively, on the paths of the two rheostats, and rods disposed at right angles to each other and connected at one end to the manipulative instrument and operating with their opposite ends, respectively, the two rheostats.

9. The combination, with an electric circuit and a manipulative instrument, of a reed or electrotome, a rheostat in said circuit and consisting of a path of semi-conducting material presenting an evenly-progressive increasing resistance to the current in said circuit, an electric conductor traveling on said path, and a rod connected to the manipulative instrument and operating the said rheostat.

10. The combination, with the manipulative instrument, the main-line circuit, and branches of said circuit, of two rheostats in said branches, reeds, or electrotomes, each of said rheostats consisting of a wheel, a path of semi-conducting material extending spirally around said wheel and presenting gradually-increasing resistance to the current in the branch, electric conductors traveling, respectively, on the said paths of the two rheostats, and rods disposed at right angles to each other and carrying conjointly at one end the manipulative instrument and operating with their opposite ends, respectively, the aforesaid rheostats, as set forth.

11. In combination with the main-line circuit and a branch of said circuit, a rheostat in said branch consisting of a path of semi-conducting material presenting gradually-increasing resistance to the electric current, an electric conductor traveling on said path, and a reed or electrotome in the branch with the rheostat, as set forth.

12. In combination with a manipulative instrument, a rheostat included with a reed or electrotome in a branch of the main-line circuit, said rheostat consisting of a path of semi-conducting material presenting gradually-increasing resistance to the current in the branch, an electric conductor to travel on said path, and a rod carrying at one end the manipulative instrument and operating with its opposite end the aforesaid rheostat, as set forth.

13. In combination with a manipulative instrument, two rheostats included with reeds or electrotomes in branches of the main-line circuit, each of said rheostats consisting of a path of semi-conducting material presenting gradually-increasing resistance to the current in the branch, and electric conductors traveling, respectively, on the paths of the rheostats, and rods disposed at right angles to each other and carrying conjointly at one end the aforesaid manipulative instrument and operating with their opposite ends the respective rheostats, as set forth.

14. The combination, with an electric circuit and a branch of said circuit, of a variable rheostat in said branch, a reed or electrotome in the branch with the rheostat, a transmitting-instrument of an autographic telegraph, and a pole-changer in said circuit controlled by the movement of the transmitting-instrument at right angles toward and from the plane of the writing-sheet, as specified.

15. The combination, with an electric circuit and a branch of said circuit, of a variable rheostat in said branch, a reed or electrotome in the branch with the rheostat, a transmitting-instrument of an autographic telegraph, and a pole-changer in said circuit operated by a magnet in a local circuit the current through which is controlled by the movement of the aforesaid transmitting-instrument toward and from the writing-sheet, substantially as described.

16. The combination, with an electric circuit and a branch of said circuit, of a variable rheostat in said branch, a reed or electrotome in the branch with the rheostat, a transmitting-instrument, a rod extended from said instrument and provided with a joint to allow said instrument to be moved toward and from the writing-sheet, a rheostat in the circuit operated by said rod, and a pole-changer also in the circuit operated by the movement of said transmitting-instrument toward and from the writing-sheet, as specified.

17. In combination with the manipulative instrument, a rheostat consisting of a rotatable drum or wheel having semi-conducting material distributed circumferentially thereon, a pinion moving synchronously with said drum or wheel, a rack engaging said pinion, a rod connected at one end to the rack by a universal joint and carrying on the opposite end the aforesaid manipulative instrument, and a pole-changer operated by the raising and lowering of the manipulative instrument.

18. The combination, with the manipulative instrument, a main-line circuit and branches of said circuit, of a variable rheostat in each of said branches, a reed or electrotome in each of said branches with the rheostat, rods connected to said instrument and disposed at right angles to each other to operate the rheostats, and a pole-changer with batteries in said branches to change the polarity of the current in the circuit when the instrument is raised above the writing-surface, as set forth.

19. In combination with the universally-movable manipulative instrument, a local electric circuit controlled by said instrument, a magnet in said circuit, a compound pole-changer operated by said magnet and adapted to change simultaneously the polarities of two electric currents from separate batteries, as set forth.

20. In combination with the main-line circuit and branches of said circuit, the universally-movable manipulative instrument, a separate battery in each of said branches, a local electric circuit controlled by said instrument, a magnet in said circuit, and a compound pole-changer in the branches operated by said magnet and adapted to change the polarity of the current in said circuit and its branches, as set forth.

21. The combination, with the main-line circuit and the stylus of a transmitting-instrument, of a variable resistance in circuit connected with and operated by said instrument, a pole-changer also in said circuit, and means for operating the pole-changer independent of the operation of the said variable resistance.

22. In combination with the stylus or pen connected movably to its handle, electric contacts between said parts, a variable resistance and pole-changer both in the same line-circuit, said pole-changer being operated by the making and breaking of the circuit by the movement of the handle on the stylus or pen, as set forth.

23. In combination with the stylus or pen of an autographic telegraph, a variable resistance consisting of a path of semi-conducting material presenting an evenly-progressive increasing resistance to the electric current, an electric conductor riding on said path, a rod connected at one end with the stylus or pen and operating with its opposite end the aforesaid variable resistance, a reed in circuit, and a pole-changer operated by the said stylus or pen independently of the operation of the resistance, as set forth.

24. In combination with the stylus or pen, variable resistances each consisting of a path of semi-conducting material presenting an evenly-progressive increasing resistance to the electric current, electric conductors riding on the paths, rods disposed at right angles to each other carrying conjointly at one end the stylus or pen and operating with their opposite ends the aforesaid variable resistance, reeds having different rates of vibration in branches of the main-line circuit with the aforesaid variable resistances, pole-changers also in the said branches of the main-line circuit, and means for operating the pole-changers independently of the operation of the resistances, as set forth.

25. In combination with the stylus or pen, variable resistances each consisting of a path of semi-conducting material presenting an evenly-progressive increasing resistance to the electric current, electric conductors riding on the paths, rods disposed at right angles to each other and carrying conjointly at one end the stylus or pen and operating with their opposite ends the aforesaid variable resistances, reeds having different rates of vibration in branches of the main-line circuit with the aforesaid variable resistances, pole-changers also in the said branches of the main-line circuit and operated by the movement of the handle of the stylus or pen, and means for accomplishing the operation of the pole-changers independently of the operation of the said resistances, as set forth.

26. In combination with the stylus or pen, variable resistances each consisting of a path of semi-conducting material presenting gradually-increasing resistance to the electric current, electric conductors riding on the paths, rods disposed at right angles to each other and carrying conjointly at one end the stylus or pen and operating with their opposite ends the aforesaid variable resistances, continuously-vibrating reeds each having a different rate of vibration in branches of the main-line circuit with the aforesaid variable resistances, and pole-changers and batteries, also in the said branches of the main-line circuit, and suitable means for operating the pole-changers through movements of said stylus or pen, but independent of the said resistances, as set forth.

27. In combination with the stylus of a transmitting-instrument controlling a variable resistance in circuit with the receiving-instrument controlling a corresponding stylus, a pole-changer at the transmitting-instrument operated by the movement of the handle of the stylus toward and from the writing-sheet, and a polarized relay at the receiving-instrument responding to the movements of said pole-changer and effecting the movement of the receiving-stylus toward and from the writing-sheet, as set forth.

28. In a receiving-instrument for autographic telegraphs, having a stylus or pen adapted to be moved in all directions, electro-magnets in a line-circuit for controlling the movements of said stylus or pen in a plane parallel with the writing-sheet and corresponding to the movements of the transmitting stylus or pen, a pole-changer operated by the movements of said transmitting stylus or pen at right angles to the plane of the writing-sheet, and a relay in the line-circuit adapted to respond to the changes in the polarity of the current and controlling the movement of the receiving-pen at right angles to the plane of the writing-sheet, substantially as described.

29. In a receiving-instrument of an autographic telegraph, having a pen adapted to be moved in all directions, electro-magnets in a line-circuit for controlling the movements of said pen in a plane parallel with the writing-sheet and corresponding to the movements of the transmitting-pen, a pole-changer operated by the movements of the handle of the transmitting-pen at right angles to the plane of the writing-sheet, a relay in the line-circuit adapted to respond to the changes in the polarity of the current, and a pen-lifter for moving said pen at right angles to the plane of the writing-sheet operated by magnets in local circuit controlled by the movements of said relay, substantially as set forth.

30. In a receiving-instrument of an autographic telegraph, having a stylus or pen, a rod carrying at one end said stylus or pen, and arranged movably thereat toward and from the writing-sheet, a lever having one end adapted to lift said rod, a magnet in a local circuit for operating said lever, and a polarized relay controlling the current in said local circuit operating said lever, as set forth.

31. In a receiving-instrument of an autographic telegraph, having a stylus or pen and a longitudinally-movable rod carrying at one end the said stylus or pen and arranged movably thereat toward and from the writing-sheet, a lever having one end adapted to lift said rod, an anti-friction roller interposed between said lever and its lifting-bearing, a magnet in a local circuit, and a polarized relay controlling the current in said local circuit and operating said lever, as set forth.

32. In a receiving-instrument of an autographic telegraph, a magnet in an electric circuit with a variable resistance, which latter is controlled by the stylus or pen of the transmitting-instrument, a pivoted armature adapted to move various distances, according to the degree of attraction of the aforesaid magnet, a rod moved longitudinally by said armature and provided with a universal joint, and the stylus or pen carried on one end of said rod, as set forth.

33. In a receiving-instrument of an autographic telegraph, a magnet in an electric circuit with a variable resistance, which latter is controlled by the stylus or pen of the transmitting-instrument, a pivoted armature adapted to move various distances, according to the degree of strength of the aforesaid magnet, a rod moved longitudinally by said armature and carrying at one end the stylus or pen and movable vertically thereat, a lever adapted to lift said end of the rod, and a magnet in a local circuit controlled by a polarized relay and operating the said lever, as set forth.

34. In a receiving-instrument of an autographic telegraph, the combination, with the stylus or pen, of rods disposed at right angles to each other and carrying conjointly at one end the aforesaid stylus or pen and provided intermediate of their length with a universal joint, magnets in electric circuits with variable resistances, which latter are controlled by the stylus or pen of the transmitting-instrument, and pivoted armatures adapted to move various distances, according to the degree of attraction of the aforesaid magnets, and operating, respectively, the aforesaid rods, as set forth.

35. In a receiving-instrument of an autographic telegraph, a magnet in an electric circuit with a variable resistance, which latter is controlled by the stylus or pen of the transmitting-instrument, a pivoted armature adapted to move various distances, according to the degree of attraction of the aforesaid magnet, a rack attached to said armature, a pinion connected to said rack, a gear pivoted in common with the said rack, a rack engaging the said gear, and a rod connected at one end to the latter rack by a universal joint and carrying at the opposite end the stylus or pen, substantially as described and shown.

36. In a receiving-instrument of an autographic telegraph, the combination of a magnet in an electric circuit with a variable resistance, which latter is controlled by the stylus or pen of the transmitting-instrument, a pivoted armature adapted to move various distances, according to the degree of attraction of the said magnet, a rack attached to said armature, a pinion engaging said rack, a gear pivoted in common with the said pinion, a rack engaging the said gear, a rod connected at one end of the latter rack by a universal joint carrying on the opposite end the stylus or pen, a lever adapted to lift the said rod, and a magnet in a local circuit controlled by a polarized relay and operating said lever, substantially as set forth.

37. In a receiving-instrument of an autographic telegraph, the combination of a magnet with a variable resistance in a local circuit, magnets in the main-line circuit controlling the variable resistance in the local circuit, a pivoted armature adapted to move various distances, according to the degree of strength of the aforesaid magnet, a rod moved longitudinally by said armature and carrying at one end the stylus or pen and movable vertically thereat, a lever adapted to lift said end of the rod, and a magnet in a local circuit controlled by a polarized relay and operating the said lever, as set forth.

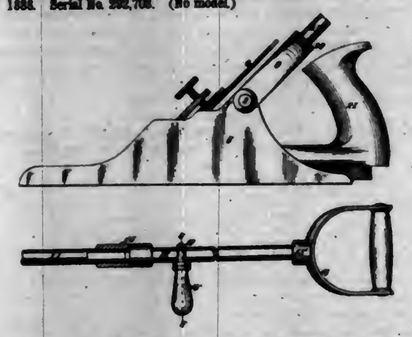
38. In a receiving-instrument of an autographic telegraph, the combination of magnets with variable resistances in the local circuits, magnets in the main-line circuit controlling the variable resistances in the local circuits, armatures adapted to move various distances, according to the degree of attraction of the magnets in the local circuits, rods disposed at right angles to each other and operated, respectively, by the aforesaid armatures and carrying conjointly at one end the stylus or pen, levers adapted to lift said rods, and magnets in a local circuit controlled by a polarized relay, substantially as set forth.

39. In a receiving-instrument of an autographic telegraph, a reed or electrotome vibrated by impulses in a magnet in the main line, a magnet and variable resistance in a local circuit controlled by the amplitude of vibrations of the said reed, a pivoted armature adapted to move various distances, according to the degree of attraction of the magnet in the local circuit, a rod moved longitudinally by said armature and carrying on one end the stylus or pen, a lever adapted to lift the said rod, and a magnet in a local circuit controlled by the movement of the polarized relay operating the said lever, as set forth.

40. In a receiving-instrument of an autographic telegraph, the combination, with the main-line circuit, of magnets in said circuit, reeds operated by impulses in the magnets, variable resistances controlled by the amplitude of said reeds, magnets in local circuits with the variable resistances, pivoted armatures adapted to move various distances, according to the degree of attraction of the magnets in the local circuits, rods disposed at right angles to each other and moved, respectively, by the aforesaid armatures and carrying conjointly at one end the stylus or pen, levers adapted to lift, respectively, the aforesaid rods, and magnets in a local circuit controlled by the movement of the polarized relay in the main circuit and operating the aforesaid levers, as set forth.

41. In a receiving-instrument of an autographic telegraph, a reed vibrated by impulses in a magnet in a line-circuit, a pivoted lever normally in contact with said reed, a path presenting increasing resistance to the current in a circuit, and an electric contact carried on the free end of said lever and traversing the aforesaid path, as set forth.

42. In a receiving-instrument of an autographic telegraph, a reed vibrated by impulses in a magnet in a line-circuit, a pivoted lever normally in contact with said reed, a path presenting increasing resistance to the current in a circuit and disposed in a plane parallel with the movement of the lever, and an electric contact carried on the free end of said lever and traversing the aforesaid path, as set forth.



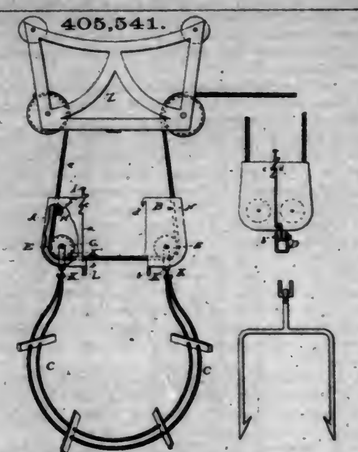
43. In a receiving-instrument of an autographic telegraph, a reed vibrated by impulses in a magnet in a line-circuit, a pivoted lever normally in contact with said reed, a path of semi-conducting material in a plane parallel with the movement of the said lever and presenting increasing resistance to the current in a circuit, and an electric contact carried on the free end of said lever and traversing the aforesaid path, as set forth.

44. In combination with a vibrating reed, a pivoted lever provided with a bearing opposed to the movement of the reed, an adjustable weight on the said lever for adjusting the sensitiveness of the movement of the lever, a path presenting increasing resistance to the current in a circuit and disposed in a plane parallel with the movement of the lever, and an electric contact carried on the free end of the lever traversing said path, as set forth.

45. In combination with a vibrating reed adapted to vibrate with different degrees of amplitude, a vibratory lever provided with a bearing opposed to the movement of the reed, a path presenting increasing resistance to the current in a circuit, and an electric contact carried on the free end of said lever and traversing the aforesaid path, the distance of travel of said contact being governed by the amplitude of vibration of the reed, as set forth.

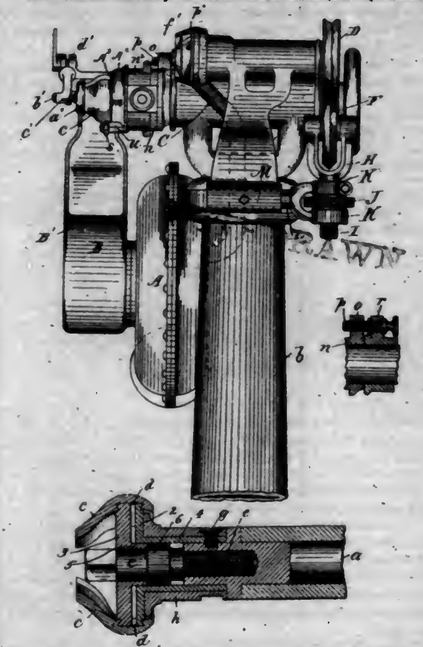
46. In combination with the stylus or pen, a feed-roller carrying the paper to be imprinted or inscribed, a spring-actuated escapement-wheel attached to said roller, and a detent engaging the said escapement-wheel and arranged in the path of the said stylus or pen to be actuated thereby, as set forth.

405,540. PLANE. JOHN J. DRIVER, St. Louis, Mo. Filed Dec. 5, 1888. Serial No. 292,708. (No model.)



Claim.—1. A handle for planes, consisting of the bow-shaped part 9, having screw-threaded socket 10, one or more screw-threaded rods joined to the same, a handle 14, swiveled to the upper end of said rods, and a handle 15, adjustably secured along said rods, for the purpose described.

2. The combination, with a plane, as herein set forth, of the ears 7, a bow-shaped piece 9, swiveled to said ears 7 by a bolt 8, screw-threaded socket 10 upon said bow-shaped piece, screw-threaded rod 11, adapted to be inserted in said socket 10, a second screw-threaded rod 12, a nut 13, having right and left hand screw-threads thereon for joining the rods 11 and 12 together, a handle 14, swiveled to said rod 12, and a handle 15, adjustable along said rod 12, substantially as and for the purpose described.



405,541. SECTIONAL LOCKING PULLEY-BLOCK. SAMUEL G. ERKSON, Belleville, Ontario, Canada. Filed Jan. 26, 1889. Serial No. 297,674. (No model.)

Claim.—A sectional locking-block for hoisting purposes, consisting of the block-section A, having the carrier-catch I, the sheave, the depending sling-catch, and the meeting-edge locking-notches and perforated lug, in combination with the section B, having similar sheave

and depending sling-catch and meeting-edge locking-hooks, and a perforated lug, substantially as specified.

405,542. HEEL-TRIMMING MACHINE. FRANK N. STERRIDGE, Lynn, assignor, by mesne assignments, to Isaac P. T. Edmands, trustee, Boston, Mass. Filed Sept. 24, 1888. Serial No. 286,260. (No model.)

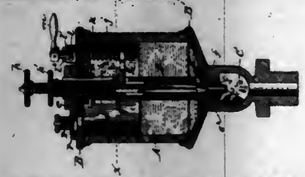
Claim.—1. In a heel-trimming machine, the combination, with the cutters c, having grooves on their inner surfaces arranged substantially at right angles with the axis of rotation of the cutter-head, of an expansible two-part holder formed to enter said grooves and composed of a section secured to a shaft and a movable section adapted to be moved or adjusted outward crosswise of said grooves, whereby the holder is enabled to engage the sides of said grooves, substantially as set forth, the minimum conjoint width of said sections being less than that of the said grooves of the cutters, as stated.

2. In a heel-trimming machine, the combination of the shaft a, the holder composed of the stationary section 2, secured to said shaft, and the adjustable section fitted to said former section, said sections having curved dovetailed ends, the screw bearing against the inner end of said adjustable section for forcing the same outward, and the

cutters having in their inner surfaces dovetail grooves or seats formed to receive the ends of said sections, as set forth, the minimum conjoint width of said sections being less than that of the said grooves of the cutters, as stated.

3. In a heel-trimming machine, the combination of the shaft *a*, the holder-section 2, having the sleeve 4 attached to the shaft and provided with the recess 7, the adjustable holder-section 3, formed to enter said recess, the bolt *c* engaged, as described, with the shaft and formed to bear against the inner end of the adjustable section, and the cutters having internal seats or grooves formed to engage the holder-sections, as set forth, the minimum conjoint width of said sections being less than that of the said grooves of the cutters, as stated.

4. In a heel-trimming machine, the combination, with a rotary cutter, of an arm or support arranged in front of the axis of the cutter, a rest pivoted at its inner end to said support and arranged to stand at right angles with the cutter as a support for the side of the heel, said rest being adapted by its pivotal connection to swing out of place, and thereby avoid the shank of a boot or shoe sole, and a spring, whereby said rest is normally held in a position at right angles with the axis of the cutter and permitted to yield and swing from said position, as set forth.



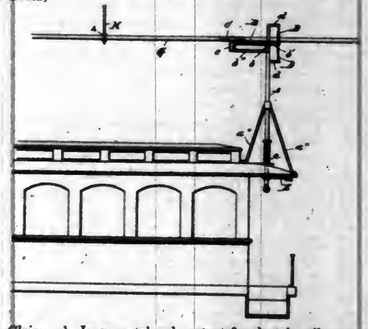
5. The combination, with the cutter-head, of the top-lift rest, the sleeve *n*, supporting said rest and adapted to slide on a fixed bearing, and the screw *p*, journaled in a lug on said bearing and engaged with a tapped socket in a lug on the sleeve *n*, as set forth.

6. In a heel-trimming machine, the combination, with the cutter-head and the rand-trimmer, of the exhaust-fan blower, the trunk or flue connected with the blower and having an enlarged mouth provided with a forwardly-projecting lip and arranged adjacent the cutter-head, the hood *p'*, and the pipe C, connecting said hood with the blower casing, substantially as set forth.

7. In a heel-trimming machine, the combination, with the exhaust-fan blower, of the hood *p'*, having the slotted arm p^3, the screw and clamping devices for said hood, and the flexible tube connecting said hood and blower, substantially as set forth.

8. The rand-trimmer composed of the cylindrical head *h'*, having pins *k'*, the knives having segmental flanges *j'* formed to fit the head and provided with orifices *l'* to receive the pins *k'*, said orifices exceeding the pins in number, the flange *s'*, secured to the head as a means of keeping the knives in engagement with the pins, and the circular guard *m'*, detachably secured to the shaft of the trimmer and serving to hold the rand-trimmer on said shaft, as set forth.

405,543. LUBRICATOR. EDWARD G. FELTHOUSEN, Buffalo, N. Y., assignor of one-half to Charles A. Sherwood, same place. Filed Dec. 26, 1888. Serial No. 294,589. (No model.)



Claim.—1. In a lubricator, the combination, with the oil-chamber provided with a discharge-passage, of a vertically-movable sleeve or support arranged within said oil-chamber, a spring whereby said support is held in a depressed position, and a regulating-valve arranged in said discharge-passage and made vertically adjustable in said sleeve or support, substantially as set forth.

2. In a lubricator, the combination, with the oil-chamber provided with a discharge-passage, of an upright tube arranged within said oil-chamber, a sliding sleeve arranged in said upright tube, a spring whereby said sleeve is pressed downwardly, and a regulating-valve arranged in said discharge-passage and provided with a stem which is made vertically adjustable in said sliding sleeve, substantially as set forth.

3. In a lubricator, the combination, with the oil-chamber provided with a discharge-passage, of a vertically-movable sleeve or support arranged within said oil-chamber, a spring whereby said support is held in a depressed position, an elevating-rod attached to said sleeve and provided with a pin or projection, a cam or incline against which said pin engages, whereby the rod is elevated upon turning the same, and a regulating-valve carried by said stem and capable of being adjusted vertically in the same, substantially as set forth.

4. In a lubricator, the combination, with the oil-chamber provided with a discharge-passage, of an upright tube arranged within said oil-chamber, an internally-threaded sliding sleeve arranged in said upright tube and provided with an arm projecting through a slot in said tube, an elevating-rod attached to said arm, provided with a pin or projection and with a hand-lever, a cam or incline arranged at the top of the lubricator, against which said pin engages, a spring whereby said sliding sleeve and elevating-rod are held in a depressed position, and a regulating-valve arranged in the discharge-passage of the oil-chamber and provided with an externally-screw-threaded stem engaging with the internal thread of the sliding sleeve, substantially as set forth.

405,544. CONTACT DEVICE FOR ELECTRIC RAILWAYS. FRANK R. FISHER, Detroit, Mich. Filed Feb. 15, 1889. Serial No. 300,000. (No model.)

Claim.—1. In an overhead contact for electric railways, a traveling contact device adapted to form a contact against the side of the conductor, said contact device being supported upon a yielding horizontal arm pivotally supported at the top of a suitable standard or post, and in connection therewith mechanism for maintaining contact between the said contact device and the conductor, substantially as described.

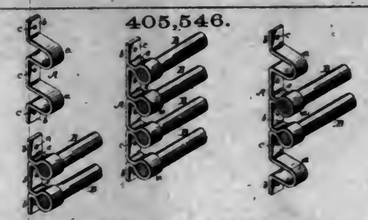
2. In an overhead contact for electric railways, the combination, with the conductor supported in suitable hangers adapted to expose the side of said conductor, of a traveling contact device adapted to form a contact with the side of said conductor, said contact device being supported upon a yielding arm pivoted to the top of a suitable standard or post, substantially as described.

3. In an overhead contact device for electric railways, a traveling contact-pulley mounted upon a suitable lateral arm, said arm pivotally connected upon the upper end of a suitable standard and provided with suitable springs for maintaining said lateral arm in a substantially horizontal position and at the same time to permit said arm to yield vertically, and in connection therewith suitable means for permitting the standard to rise and lower upon the car, and suitable means for throwing the contact-pulley into and out of contact with the conducting-wire, substantially as described.

405,545. ROAD-CART. CHARLES H. FORTNEY, Montgomery's Ferry, Pa. Filed Mar. 29, 1889. Serial No. 305,289. (No model.)

Claim.—1. The combination, with a clip-plate provided with an angular recess surrounding one of its bolt-holes, of the bolt, the washer seated in said recess and provided with radial notches in its outer face, and the lock-nut having obliquely-extending springs secured in recesses in its inner face, substantially as herein set forth.

2. The combination of the clip-plate having an angular recess, the bolt, the washer having a series of radial notches in its outer face, and the lock-nut provided in its inner face with a series of oblique notches, in which springs projecting from the inner face of said nut are suitably secured, substantially as herein set forth.



3. The combination, with the shaft and seat-bar of a road-cart, of a U-shaped clip having an angular recess in one of its outer faces, a transverse bolt, an angular washer seated in the recess of the clip-bolt and provided in its outer face with a series of radial notches, and a lock-nut provided with springs extending obliquely from its inner face, substantially as and for the purpose specified.

405,546. INSULATOR. ROBERT P. FRIST, Wilmington, Del. Filed Apr. 13, 1889. Serial No. 307,141. (No model.)

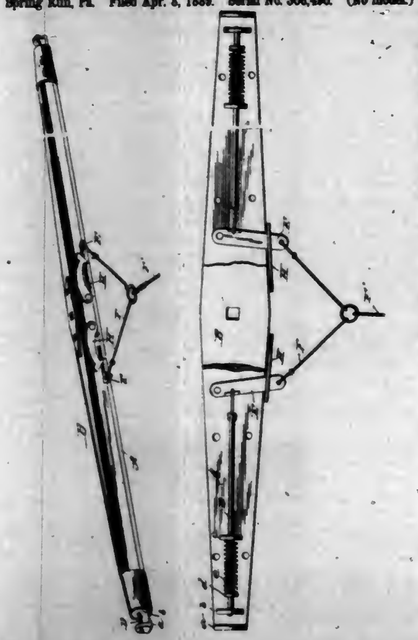
Claim.—1. An insulator for electric wires, consisting of a strip folded to form a wire-receiving loop at the outer end and having fastening-ears at the inner ends, the intermediate portions being pressed together to bind the wire in the loop, substantially as described.

2. An insulator for electric wires, consisting of a strip of insulating material bent to form a series of loops for retaining the wires,

405,546.

with spaces between the loops, through which the retaining nails or screws may be passed, substantially as set forth.

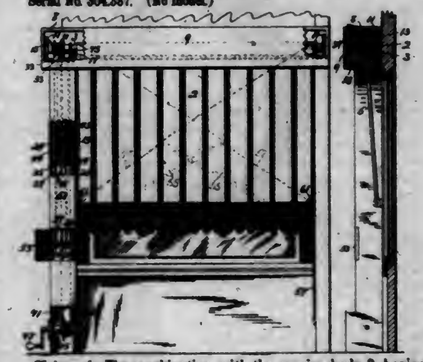
3. An insulator for electric wires, consisting of insulating material bent to form a series of wire-receiving loops located side by side, said insulator being flexible throughout its length, substantially as specified.



405,547. VEHICLE-SPRING. JOSHUA G. GAY, Ottawa, Ill. Filed Feb. 21, 1889. Serial No. 300,694. (No model.)

Claim.—1. The combination, with the parallel torsion-springs having the squared ends, and the rounded torsional portions provided with arms at right angles thereto, of the vehicle-sills, the boxes having longitudinal channels and the squared seats and rounded bearings, and the square bearings crossing said channels, and round clip-bolts in connection therewith, substantially as specified.

2. The combination, with the bearing-boxes having longitudinal channels and rounded bearings and squared seats crossing said channels, and their clip-bolts, of the parallel torsion-rod springs having squared fixed ends, and arms extending at right angles to their transverse portions and diagonally to the faces of the squared portion, the rabbeted link-connections, and the T-form bolster, substantially as specified.



405,548. DETACHABLE WHIFFLETREE. JOSEPH G. GOSNORE, Spring Run, Pa. Filed Apr. 8, 1889. Serial No. 306,490. (No model.)

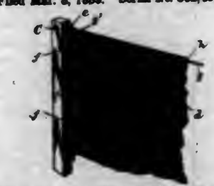
Claim.—1. In combination with the plate A, carrying spring-bolts and operating-levers for said bolts, a wooden part B, fitting over the plate A and covering the operating parts, substantially as described.

2. In combination with the plate A, carrying spring-bolts and operating-levers therefor, pivoted hooks for engaging said levers to hold the bolts out of engagement, substantially as described.

405,549. AWNING. HERMAN D. GREENWALD, St. Paul, Minn., assignor of one-half to Jehiel W. Jagger, same place. Filed Mar. 22, 1889. Serial No. 304,367. (No model.)

Claim.—1. The combination, with the awning-body 2, having a suitable hinged metallic frame, of the roll 3, secured to the upper edge of the body 2 and turning in suitable bearings, suitable cords secured to said roll for rotating the same in either direction, the windlass 45, having the crank 47, also secured to said cords, which are arranged to wind upon the roll 3 and the windlass in opposite directions, and each to wind alternately upon roll and windlass, combined and operating substantially as described.

2. The combination, with the awning-body 2, the roll 3, secured thereto, the windlass 45, and the cords 41 and 43, secured to and adapted to be wound alternately upon said roll and windlass, of a suitable case inclosing said roll 3, having the flap 9 hinged to the top 8 and provided with the arms 11, and the cords 13 and 29, attached to and adapted to respectively open and close said flap, combined and operating substantially as described.

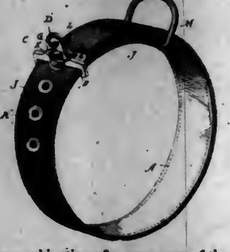


3. The combination of the awning-body 2, having a metallic frame with side bars bent downward into a partial hook at the outer end, the wings 55, provided with the cords 57, by means of which they can be secured to the building when down or flat upon the body 2, a suitable case inclosing said roll, comprising the bottom 7, the top 8, and hinged flap 9, having the arms 11, suitable cords 13 and 29, for opening and closing said flap, the windlass 45, and the raising and lowering cords 41 and 43, one of said cords being provided with the spiral spring 49, combined and operating substantially as described.

4. In a device of the class described, means for protecting the awning when rolled up, comprising a case having a hinged flap, cords secured to said flap, adapted, respectively, when operated to open and to close said flap, a roll mounted in said case, means for turning said roll in either direction, and an awning secured upon said roll.

5. In a device of the class described, the combination of a casing having an open front provided with a hinged flap, a roll mounted in said casing, means for turning said roll in either direction, and an awning secured to said roll and adapted to be wound thereon.

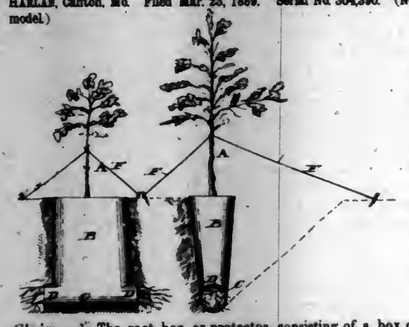
6. In a device of the class described, the combination of a casing having an open front provided with a hinged flap, a roll mounted in said casing, means for turning said roll in either direction, and an awning having its top secured to said roll and the side bars pivoted below said roll and having their outer end secured to the bottom of said awning.



405,550. WINDOW-VENTILATOR. FERDINAND GROSHANS, Baltimore, Md. Filed Mar. 8, 1889. Serial No. 302,408. (No model.)

Claim.—The window ventilator and screen having in combination the vertical parting-strips C on the window-frame, two binding-

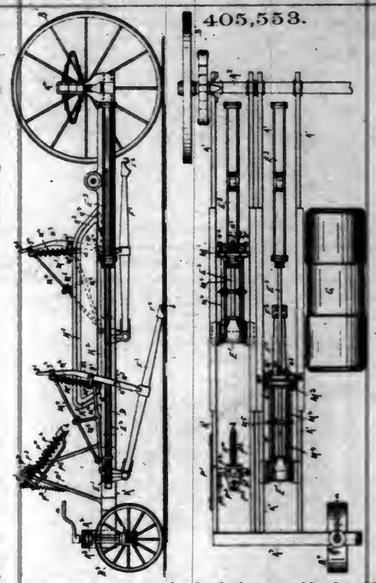
strips *c*, each secured to one of the said parting-strips, a cross-wire *g*, having its ends engaged with the binding-strips, and the thin fabric *d*, attached to the binding-strips and also to the said cross-wire, as set forth.



405,551. FASTENING DEVICE FOR DOG-COLLARS. WALTER C. GUNN, Chicago, Ill. Filed Dec. 8, 1888. Serial No. 293,057. (No model.)

Claim.—1. The combination of a strap, one of the ends of which is provided with perforations; a frame, and a locking-bolt on said frame engaging said perforations, said frame being secured to one of said ends and embracing the strap, and provided with an arched guard or stop extending over the outer end of said bolt, substantially as described.

2. The combination of a strap, one of the ends of which is provided with perforations, a fastener device, the frame of which is secured to one of said ends and embraces the other end, a locking-bolt sliding in said frame and engaging the perforations, and a loop or hand-hold secured to the other end, and with said end encircling the body of the strap, whereby the ends of said strap are maintained parallel with and against the body of the strap in all of its adjustments, substantially as described.



405,552. DEVICE FOR PROTECTING FRUIT-TREES. FRANK HARLAN, Canton, Mo. Filed Mar. 23, 1889. Serial No. 304,390. (No model.)

Claim.—1. The root box or protector, consisting of a box of suitable material adapted to be tilted sidewise on its bottom and having outlets or apertures at opposite ends in a line with the axis of the bottom, substantially as and for the purpose set forth.

2. The root box or protector B, having a rounded bottom C and tubular extensions D D, open at their outer ends, substantially as and for the purpose set forth.

405,553. SELF-PROPELLING MOTOR. HENRY C. HICKS, Minneapolis, Minn. Filed Mar. 8, 1889. Serial No. 302,410. (No model.)

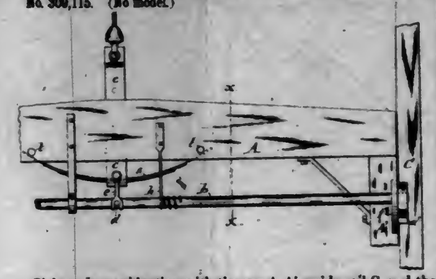
Claim.—1. In a self-propelling motor, a frame mounted upon bearing-wheels or other supports and provided with guides D, one or more cylinders E^3, borne by said frame and having piston-rods connected to cross-heads with their ends running in said guides, push-arms F', pivoted by one end in said cross-heads and free to run upon the ground by their other ends, substantially as and for the purpose set forth.

2. In a self-propelling motor, a frame mounted upon bearing-wheels or other supports and supporting one or more cylinders E^3, having piston-rods and cross-heads, the latter working in guides D in said frame, push-arm F', journaled by one end in said cross-heads, cam-groove H' H^3, having spring-switch H^4, formed in said frame, arch-frame M', with its ends running in said cam-grooves and connected by rods N' N^3 to said push-arm and by braces M^3 M^4 to said cross-head, substantially as and for the purpose set forth.

3. In a self-propelling motor, a frame mounted upon bearing-wheels or other supports and supporting one or more cylinders E^3, having piston-rods and cross-heads, the latter working in guides D in said frame, push-arm F', journaled by one end in said cross-heads, cam-grooves H' H^3, having spring-switch H^4 formed in said frame, arch-frame M', with its ends running in said cam-grooves, cross-plate M^2, embracing the sides of said arch-frame and actuated by springs M^4, rods N' N^3, connecting said cross-plates to said push-arm, and braces M^3 M^4, connecting said arch-frame to said cross-heads, substantially as and for the purpose set forth.

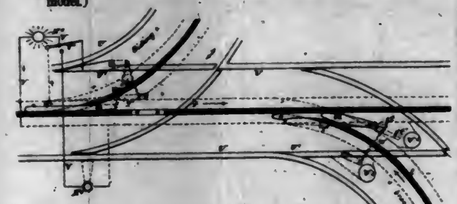
4. In a self-propelling motor, a frame mounted upon bearing-wheels or other supports and supporting one or more cylinders E^3, having piston-rods and cross-heads, the latter working in guides D in said frame, push-arm F', journaled by one end in said cross-heads, cam-grooves H' H^3, having spring-switch H^4 formed in said frame, arch-frame M', with its ends running in said cam-grooves, cross-plate M^2, embracing the sides of said arch-frame and actuated by springs M^4, rods N' N^3, jointed at c^3 and connecting said cross-plate and push-arm, and a lever N^2, pivoted to said cross-plate and said rods, and adapted to be connected to and disconnected from said arch-frame, whereby said push-arm may be elevated and depressed, substantially as and for the purpose set forth.

5. In a self-propelling motor, a frame mounted upon bearing-wheels or other supports and supporting one or more cylinders E^3, having piston-rods and cross-heads, the latter working in guides D in said frame, push-arm F', journaled by one end in said cross-heads, cam-groove H' H^3, having spring-switch H^4 formed in said frame, arch-frame M', with its ends running in said cam-groove and connected by rods N' N^3 to said push-arm and by braces M^3 M^4 to said cross-head, spring trip-rod P^4, pivoted to said frame above and in advance of the line of said cam-grooves, and a stop-rod M^5, connected to said arch-frame and adapted to strike said trip-rod at the end of the return-stroke of the piston, whereby the arch-frame and push-rod are forced downward, substantially as and for the purpose set forth.



405,554. APPLIANCE FOR HOLDING UMBRELLAS &c. HARRY HOUGH, Peckham, County of Surrey, England. Filed Sept. 15, 1888. Serial No. 285,485. (No model.)

Claim.—1. An umbrella rack or holder consisting of a rigid bracket A, provided with arms B, and revoluble flexible disks D, as herein set forth.



2. An umbrella rack or holder consisting of a rigid bracket A, provided with arms B, and revoluble india-rubber disks D, as and for the purposes herein set forth.

405,555. SAFETY-CLUTCH FOR ELEVATORS. EDGAR W. HOUSER, Syracuse, N. Y. Filed May 14, 1888. Renewed Apr. 29, 1889. Serial No. 309,115. (No model.)

Claim.—In combination with the car A A', guide-rail C, and the strap *c*, supporting the car by a spring, the jaw *a*, fixed to the car at one side of the guide-rail, the shaft *b*, extended across the car, the jaw *a'*, secured to the end of said shaft, crank-connections between the strap *c* and shaft *b*, and the spring *k*, arranged to turn the shaft and hold the jaw *a'* normally out of engagement with the guide-rail, substantially as set forth.

405,556. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Original application filed Apr. 23, 1886, Serial No. 200,400. Divided and application filed Feb. 25, 1889, Serial No. 301,139. Again divided and this application filed Apr. 9, 1889. Serial No. 306,567. (No model.)

Claim.—1. In an electric railway, the slotted main and branch conduits each provided with working-conductors, a pivoted switch or end section for said conductors at the branching point, and a closed passage-way from the surface of the roadway to the hinged part of said switch.

2. In an electric railway, a branching conductor arranged along and parallel to a branching railway, in combination with a movable conductor-switch at said branching point to guide the collector of the motor upon either branch track desired, and an electric signal consisting of an electric lamp, a source of electric supply, a circuit including said supply and lamp, and a switch in said circuit adapted to be operated by the conductor-switch, whereby the signal is automatically displayed upon moving the conductor-switch section to indicate to the driver of the approaching car which branch conductor the switch has opened.

3. In an electric railway, a branching conductor arranged along and parallel to a branching railway, in combination with a movable conductor-switch section at the point of branching to guide the collector of the motor upon either branch track desired, two signals, one for each branch, and connecting devices under the control of the switch-section, whereby a movement of the said switch will display either of said signals, but not both at one time.

4. In an electric railway, a branching conductor arranged along and parallel to a branching railway, in combination with a movable conductor-switch section at the point of branching to guide the collector of the motor upon either branch track desired, two electric-light signals of different colors, one for each branch track, two electric circuits, one for each of said lamps, and circuit-breakers controlled by the movement of the switch-section.

5. In an electric-railway, a branching conductor arranged along and parallel to a branching railway, in combination with a movable conductor-switch section at the point of branching to guide the collector of the motor upon either branch track desired, two electric-light signals of different colors, one for each branch track, two electric circuits derived from the line-conductors, one for each of said lamps, and circuit-breakers controlled by the movement of the switch-section.

6. In an electric railway, the combination of branching tracks having rail-switches at said point of branching with a branching line-conductor arranged parallel to said railway, and an electric signal displayed by the movement of the rail-switch to indicate which branching track is open for the electric motor.

7. In an electric railway, the combination of branching tracks having rail-switches at said point of branching with a branching line-conductor arranged parallel to said railway, an electric signal displayed by the movement of the rail-switch to indicate which branching track is open for the electric motor, an electric circuit including said signal and derived from said line-conductor, a circuit-breaker to break said circuit, and a connection between the circuit-breaker and rail-switch.

8. In an electric railway, the combination of branching tracks having rail-switches at said point of branching with a branching line-conductor arranged parallel to said railway, a movable conductor-switch, a connection between the rail and conductor switches, whereby both shall move simultaneously, an electric signal displayed by the movement of the rail-switch to indicate which branching track is open for the electric motor, an electric circuit including said signal and derived from said line-conductor, a circuit-breaker to break said circuit, and a connection between the circuit-breaker and rail-switch.

9. In an electric railway, a branching slotted conduit, a slot-switch at the point of branching, a branching conductor placed within and insulated from said conduit, and a signal operated by the movement of the slot-switch to indicate to the driver of an approaching motor which branch is open.

10. In an electric railway, the combination of a branching slotted conduit, a slot-switch at the point of branching, a branching conductor placed within and insulated from said conduit, an electric signal, a circuit derived from the line-conductor to actuate said signal, a circuit-breaker to break said circuit, and a connection between said circuit-breaker and slot-switch, whereby the movement of the slot-switch indicates to the driver of an approaching motor which branch is open.

11. In an electric railway, the combination of a branching slotted conduit, a slot-switch at the point of branching, a branching conductor placed within and insulated from said conduit, a movable switch-conductor therefor, an electric signal, a circuit derived from the line-conductor to actuate said signal, a circuit-breaker to break said circuit, and a connection between said circuit-breaker and slot-switch, whereby the movement of the slot-switch indicates to the driver of an approaching motor which branch is open.

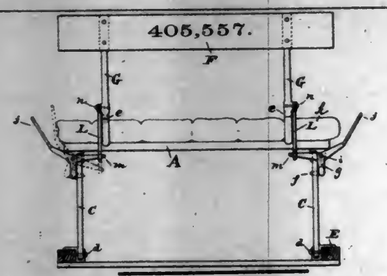
12. In an electric railway, the combination of a slotted conduit, hinged or removable doors at one or more places on said conduit and forming part of the sides of the slot, and an electric conductor within said conduit and insulated therefrom.

13. In an electric railway, the combination of a slotted conduit, hinged or removable doors at one or more places on said conduit and forming part of the sides of the slot, cleaning-wells under said doors, and working-conductors supported within said conduit and insulated therefrom.

14. In an electric railway, the combination of a slotted conduit, longitudinal working-conductors supported therein and insulated therefrom, and cleaning-wells arranged at intervals along the conduit and opening from the same and in which the space between the conductors and cleaning-wells is unobstructed.

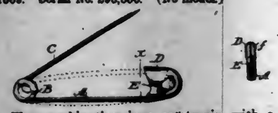
15. In an electric railway, the combination of a slotted conduit, longitudinal working-conductors supported therein and insulated therefrom, and cleaning-wells arranged at intervals along the conduit and opening from the same, and provided at their bottoms with open grates.

16. In an electric railway, the combination of a slotted conduit, longitudinal working-conductors supported therein, located upon each side of the slot thereof and insulated therefrom, and cleaning-wells arranged at intervals along the conduit and opening from the same, and in which the space between the conductors is unobstructed from the slot to the cleaning-wells.



17. In an electric railway, the combination of a conduit having a longitudinal slot, and cleaning-wells arranged at intervals apart and opening from the bottom thereof, and a longitudinal conductor extending along within the conduit and located to one side of the slot thereof, insulated supports therefor connecting the conductor with the conduit structure and to one side of the cleaning-wells, and covered passages to said cleaning-wells from above.

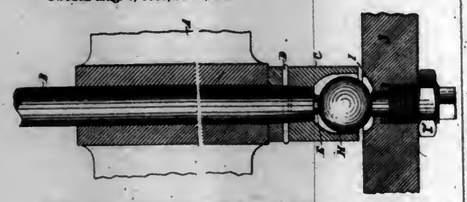
405,557. JUMP-SEAT FOR VEHICLES. GEORGE H. HUTTON, Baltimore, Md. Filed Feb. 12, 1889. Serial No. 299,632. (No model.)



Claim.—1. The combination of the seat A, mounted on pivoted legs, an iron I, pivoted below each end of the seat and provided with a stop-lug *f*, a seat-back F, jointed irons G, each having one end rigidly secured to the seat and the other to the said back, and a rod L, connecting each pivoted stop-lug iron and that part of the jointed iron to which the seat-back is secured.

2. The combination of the seat mounted on pivoted legs, an iron pivoted and provided with a stop-lug *f* to engage with a leg and having a lateral arm *m*, a seat-back supported by jointed irons G, secured to the seat, and a rod L, having one end jointed to the said lateral arm on the lug-iron and the other end jointed to the said seat-back iron.

405,557.



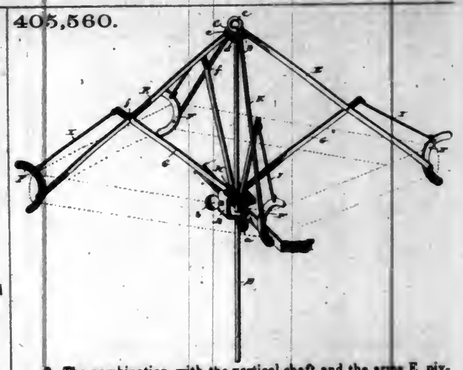
405,558. **SAFETY-PIN.** JOEL JENKINS, Montclair, N. J. Filed Feb. 6, 1889. Serial No. 298,830. (No model.)

Claim.—The combination, in a safety-pin, with a shield whose width but slightly exceeds that of the pin-point, of a single guide-plate secured to the body-bar of the pin and whose free end extends into the concavity of the shield far enough to positively prevent the passage of the pin-point laterally through the shield, but yields laterally to permit said point to enter, lodge within, and leave the shield from either side, substantially in the manner and for the purpose herein set forth.

405,559. **STEP-BEARING FOR SHAFTS.** CARL A. JOHANSSON, Stockholm, Sweden, assignor to the Aktiebolaget Extraktor, same place. Filed Feb. 21, 1889. Serial No. 300,664. (No model.) Patented in Sweden Aug. 7, 1888, No. 1,644.

Claim.—1. The combination of a shaft having a cup fixed on its end and rotating therewith, the mouth of said cup being directed away from the shaft, a bearing-stud aligned with said shaft, and a ball or sphere within said cup and embraced between the end of some part of the shaft within the cup and the said bearing-stud, the diameter of the cavity of the cup being a little greater than that of the ball, which latter is in contact peripherally with the wall of said cup at one side, whereby, when the shaft revolves, said ball is rotated through its lateral contact with the cup, as set forth.

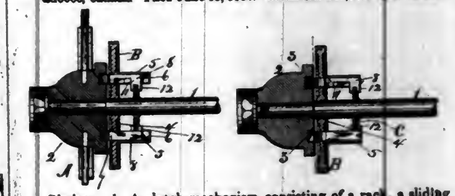
2. The combination, with the shaft B, provided with the projecting plug E, and the cup C, fixed on the end of said shaft and revolving therewith and provided with an oil-retaining flange, of the adjustable bearing-stud I in line with the shaft and the ball or sphere H within said cup and embraced between the plug E and stud I, the diameter of the cup being greater than that of the ball, which latter is in contact peripherally with the wall of said cup at one side, whereby said cup drives said ball, as set forth.



405,560. **YARN-REEL.** JOHN A. KASPAR, Jr., Pomeroy, Ohio. Filed Mar. 23, 1888. Serial No. 304,493. (No model.)

Brief.—The object of the invention is to provide a yarn-reel of simple construction and which may be readily adjusted to accommodate skeins of differing sizes and yet have the yarn near the table to which the reel is attached.

Claim.—1. The combination, with the vertical shaft, of the arms E, pivotally secured to the upper end thereof, the holders pivotally secured to the lower ends of said arms, the arms G, pivoted to the said arms and connected with the holders and also pivotally connected to a disk sliding on said shaft, substantially as shown and described.

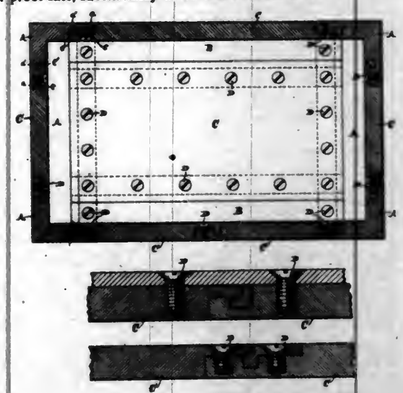


2. The combination, with the vertical shaft and the arms E, pivotally connected to the upper end thereof, of the sliding disk on said shaft, the arms G, pivotally connected at one end to said disk, the holders pivotally secured to the lower ends of the arms E, below their center, and the rods pivotally connecting the upper ends of the arms G with the said holders above their center, substantially as shown and described.

405,560.

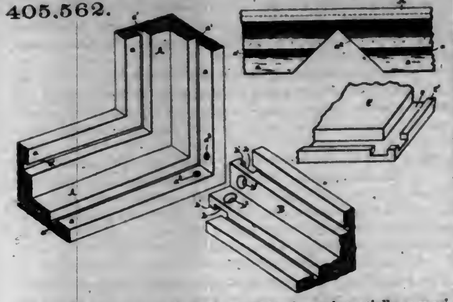
3. The combination, with the vertical shaft and the arms E, pivotally connected with the upper end thereof, of the sliding disk on the shaft, the holders pivotally connected with the lower ends of the arms E, the arms G, pivotally connected at one end with the said disk and near the other end pivotally connected with the arms E and formed at their connection with said arms with the bends *f*, and the rods pivotally connecting the extended ends of the arms G with the holders, substantially as shown and described.

405,561. **FERTILIZER-DISTRIBUTER.** JOSEPH S. KNEP, Magog, Quebec, Canada. Filed June 15, 1887. Serial No. 241,373. (No model.)



Claim.—1. A clutch mechanism consisting of a rack, a sliding pawl beveled, as shown, and provided with a stud 11, a wedge provided with studs 12, and a ring engaging with the wedge and the pawl, substantially as shown and described.

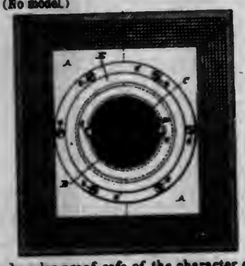
2. In a clutch, a bipartite pawl consisting of a shank having an inclined edge behind the point, and a point and a wedge fitting against the inclined part of the shank, substantially as described.



3. In a clutch, a bipartite pawl provided with upright studs, in combination with a ring engaging with the studs upon the pawl-sections, substantially as described, for the purposes set forth.

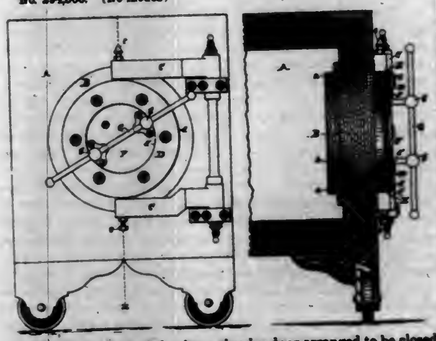
405,562. **SAFE.** PHINEAS F. KING, Cincinnati, Ohio, assignor to Moses Mosler, same place. Filed Aug. 13, 1888. Serial No. 282,487. (No model.)

Claim.—1. The combination of the bent angle-frames A, grooved and rabbeted at *a a'*, and the straight angle-bars B, similarly grooved upon their inside faces, and transversely rabbeted and grooved at *b b'* to match into the corners of frames A to form the skeleton of a burglar-proof safe, substantially as hereinbefore set forth.



405,562.

2. In a burglar-proof safe, the combination, substantially as specified, of the angle-bar frames tongued and grooved near their edges, as shown, the straight angle-bar pieces similarly tongued and grooved, and also tongued and grooved transversely at each end to match the corners of the frames, and the wall-plates for the body of the safe having their edges formed to interlock with the angle-bar frames and their connecting angle-bars, for the purpose set forth.

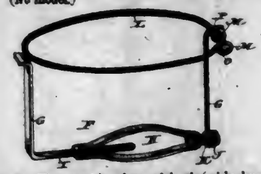


3. The combination, in a burglar-proof safe, of the angle-bar frames, the straight angle-bars connecting two of said frames, and the wall-plates C and interior lap-plates, said frames, angle-bars, and plates C having overlapping and interlocking edges, whereby the parts may be secured together from the inside and wedging or separation of the parts prevented.

405,563. **BURGLAR-PROOF SAFE.** PHINEAS F. KING, Cincinnati, Ohio, assignor to Moses Mosler, same place. Filed Dec. 24, 1888. Serial No. 294,499. (No model.)

Claim.—In a burglar-proof safe of the character described, the combination of the safe-front, having a circular door-opening, the interiorly-screw-threaded ring surrounding said opening, the circular door, the screw-threaded disk secured upon the inner face of the door, the ring D, screwed onto said disk, and the keys for locking the said disk and ring together.

405,564. **BURGLAR-PROOF SAFE.** PHINEAS F. KING, Cincinnati, Ohio, assignor to Moses Mosler, same place. Filed Dec. 24, 1888. Serial No. 294,500. (No model.)



Claim.—1. In a safe having a circular door arranged to be closed by rotating it and secured by a lock preventing its rotation, the combination of a fixed ring secured to the front of the door, a door-carrying ring for connection with the hinge, a circular case within the fixed ring for the reception of a lock and attachment of the handle for rotating the door and having its edge slotted to pass a lock-bolt, a lock within said case so arranged that its bolt will pass through said slot, a coupling-bolt arranged to slide in the fixed ring and to be forced in one direction by the lock-bolt, a spring to force the coupling-bolt in the opposite direction, whereby the door-carrying ring is locked to the door and the handle and lock are disconnected when the bolt of the lock is shot out and the handle coupled to the door, and the door-carrying ring disconnected when the lock-bolt is retracted.

2. A handle connecting and disconnecting device for circular doors for safes, consisting of a ring rigidly connected to the door-front, a loose ring around said rigid ring to connect to the hinge-pivots and support the door, a circular box or lock-case fitted to turn within said ring, a handle connected to said box, a spring-actuated bolt recessed in the rigid ring and arranged to couple either the outer door-carrying ring or the inner lock and handle carrying case, and a lock within said case, substantially as and for the purpose set forth.

3. The combination, substantially as specified, of the safe-body A, having a circular door-opening, the interiorly-screw-threaded ring *a*, secured upon the inner front wall and surrounding the door-opening, the circular door B, having upon its inner end the screw-threaded part *b*, the ring D, having flanges *d d'* secured to the door-front, the ring E, fitted around the ring D and confined by its flange *d*, the circular box F within ring D and confined by its flange *d'* and having the slotted bolt-opening, the lock H, having bolt *h* to protrude through the opening in box F, and the spring-actuated bolt I.

405,565. **STOVE-PIPE AND COLLAR HOLDER.** GERHARD KOEB and JACOB B. KOEB, Springfield, Ohio. Filed Aug. 9, 1888. Serial No. 282,361. (No model.)

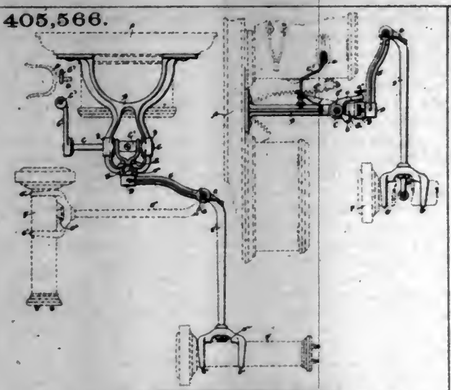
Claim.—1. The combination, with the side bars and the collar with which their free ends are constructed to engage and a connecting screw-threaded nut which expansively connects the other ends of said bars, of a band connected to one of them and provided with devices to contract its circumference.

2. The combination, with the side bars having outwardly-turned free ends and a swivel-nut adjustably connecting their inner ends, of a band connected to one of them and having two eyes, and a bolt fitted to said eyes, by which the band may be circumferentially contracted.

3. The combination, with the swivel-nut, of a side bar and a band composed of one piece of wire, with a bend in the body to constitute an eye, and a bend at the free end of the band portion to constitute another eye, a bolt fitted to said eyes and having a nut, and another side bar having one end turned outwardly and the other inwardly and provided with a thread which engages the swivel-nut.

4. The combination, with the swivel-nut, of side bars having their free ends turned outwardly and one of them provided with an inwardly-turned screw-threaded portion which engages said nut, and the other of them pivotally connected with the opposite end of the nut.

5. The combination, with the side bars and a band connected to one end of one of said side bars and provided with devices to contract its circumference, of a connecting screw-threaded nut which expansively connects the other ends of said bars.



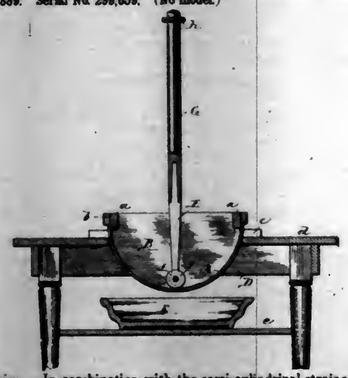
405,566. **TELEPHONE ATTACHMENT.** OTTO KOSMOLOW, Cleveland, Ohio. Filed Oct. 27, 1888. Serial No. 289,963. (No model.)

Claim.—1. The combination of jointed arms of unequal length, a spring for folding the arms, the shorter arm being mounted on a trunnion to turn in a vertical plane, the longer arm having a telephone-receiver attached to the free end thereof, substantially as indicated, whereby the gravity of the receiver, when left free, tends to turn the arm to a vertical position, substantially as set forth.

2. The combination, with jointed arms mounted on a trunnion, a spring, and receiver, substantially as indicated, of a cam mounted on such trunnion and operating between the prongs of a yoke, the latter, by means of suitable connecting mechanism, being made to operate the cut-out lever of the instrument by turning the jointed arms upon their axes, substantially as set forth.

3. The combination, with jointed arms adapted to operate in the same or in parallel plane, said arms having a horizontal axis and having a spring for folding the joints thereof, each arms having attached at the free end thereof a telephone-receiver, of cam, yoke, rock-shaft, rock-arm, and link, substantially as indicated, for connecting such folding-arms of the cut-out lever of the instrument, substantially as set forth.

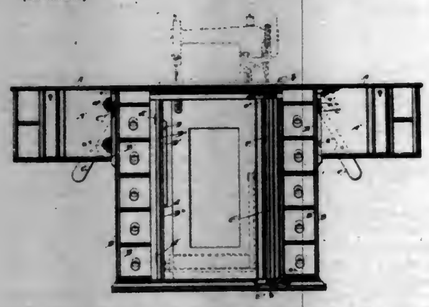
405,566.



levers loosely connected to said body and cover, each lever being provided at one end with a hook adapted, when its respective section is lowered, to enter a slot in said section and support the same, substantially as set forth.

4. The combination, with a body and levers pivoted to said body, each lever provided at its pivoted ends with a hook, and at a point near its opposite end with an elongated slot, of a bisected cover, a pin attached to each section of said cover and passing through the slot in its lever, each section of the cover having a slot adapted to receive the hook of its lever when lowered to a position alongside of the body.

5. The combination, with a cabinet sewing-machine, of a door for closing the recess wherein the treadle operates, such door being in two sections, the lower section being hinged to the upper section, so as to fold up outside the upper section, the latter being hinged to the cabinet, so as to open inward, substantially as set forth.

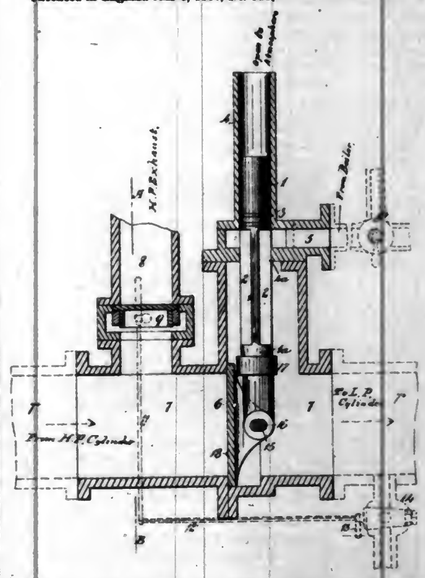


6. The combination, with door and adjacent tier of drawers, of intervening sliding jamb, the latter having a member adapted to overlap and lock the drawers, engaging beveled edges on the door and jamb for moving the jamb toward the drawers, and springs for moving the jamb away from the drawers with the opening of the door, substantially as set forth.

405,567. STRAINER. ALBERT KUMMLE, Chicago, Ill. Filed Feb. 12, 1889. Serial No. 299,659. (No model.)

Claim.—In combination with the semi-cylindrical strainer, the shank F, provided with laterally-projecting studs *f* and rollers *g*, mounted on said studs, handle G, and stud H, having eye *h*, through which the upper end of the handle passes, as set forth.

405,568. COMBINATION-CABINET FOR SEWING-MACHINES. THEODOR KUNDTS, Cleveland, Ohio. Filed Nov. 5, 1888. Serial No. 290,035. (No model.)



Claim.—1. In a cabinet sewing-machine, the combination, with a cover divided vertically from front to rear, substantially as indicated, of levers pivoted to each section of the cover and to the body of the cabinet in position to unite the cover-sections on top the machine to form a top-table, said levers being in position to fold the cover-sections against the cabinet in prolongation of the table whereon the machine is operated, substantially as set forth.

2. The combination, with the bisected cover, substantially as indicated, of folding front lids for each cover-section, said folding front lids, when lowered, constituting a writing-desk, substantially as set forth.

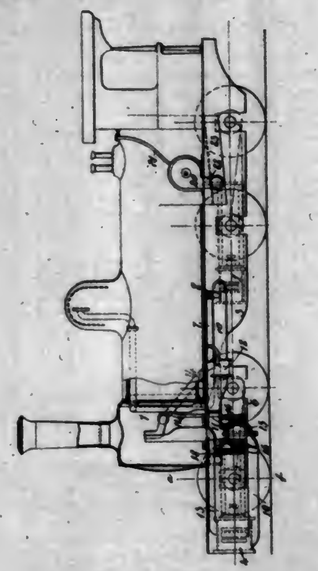
3. The combination, with bisected cover and a body, of tilting

405,569. COMPOUND ENGINE. RICHARD H. LAPAGE, Westminster, England. Filed Dec. 30, 1887. Serial No. 259,429. (No model.) Patented in England Jan. 8, 1887, No. 310.

Claim.—1. In a compound engine, the combination of a connecting pipe or receiver for conveying exhaust-steam from the high-pressure cylinder to the low-pressure cylinder, a valve-case in said pipe or receiver provided with an inlet-passage for high-pressure steam and an outlet-passage for such steam to the low-pressure cylinder, an intercepting-valve adapted to control the passage through said pipe or receiver, a starting-valve connected to said intercepting-valve subject to the pressure of high-pressure steam and adapted to control the said outlet-passage, an unbalanced plunger connected to said intercepting and starting valves and subjected at one end to the pressure of steam and at the other end to the pressure of the external atmosphere, and a main steam-valve provided with separate supply-communications to said inlet-passage and to said high-pressure cylinder and constructed to simultaneously admit high-pressure steam to said inlet-passage and to said high-pressure cylinder, said intercepting, starting, and main steam-valves being so arranged and constructed that on the opening of the main steam-valve steam from the boiler, aided or not by gravity, will cause the intercepting-valve to close, thereby cutting off communication between the high and low pressure cylinders and simultaneously admitting high-pressure steam to the steam-chests of the high and the low pressure cylinders, substantially as herein described, for the purposes set forth.

2. In a compound engine, the combination of a connecting pipe or receiver for conveying exhaust-steam from the high-pressure cylinder to the low-pressure cylinder, a valve-case in said pipe or receiver

provided with an inlet-passage for high-pressure steam and an outlet-passage for such steam to the low-pressure cylinder, an intercepting-valve adapted to control the passage through said pipe or receiver, a starting-valve connected to said intercepting-valve subject to the pressure of high-pressure steam and adapted to control the said outlet-passage, an unbalanced plunger connected to said intercepting and starting valves and subjected at one end to the pressure of steam and at the other end to the pressure of the external atmosphere, a main steam-valve provided with separate supply-communications to said inlet-passage and to said high-pressure cylinder, and constructed to simultaneously admit high-pressure steam to said inlet-passage and to said high-pressure cylinder, a high-pressure exhaust-pipe communicating with said connecting pipe or receiver on the high-pressure side of said valve-case, and a valve for controlling the communication through said high-pressure exhaust-pipe, said intercepting-valve being adapted to automatically close and open communication between the said high and low pressure cylinders, and said starting-valve being adapted to automatically open and close said inlet and outlet passages, substantially as herein described, for the purposes set forth.



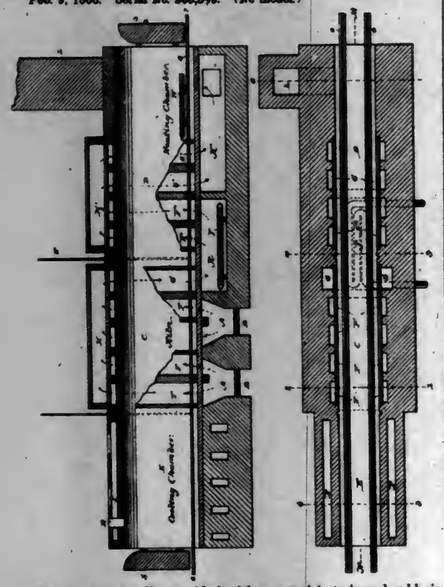
3. In a compound engine, the combination of a connecting pipe or receiver for conveying exhaust-steam from the high-pressure cylinder to the low-pressure cylinder, a valve-case in said pipe or receiver provided with an inlet-passage for high-pressure steam and an outlet-passage for such steam to the low-pressure cylinder, an intercepting-valve adapted to control the passage through said pipe or receiver, a starting-valve connected to said intercepting-valve subject to the pressure of high-pressure steam and adapted to control the said outlet-passage, an unbalanced plunger connected to said intercepting and starting valves and subjected at one end to the pressure of steam and at the other end to the pressure of the external atmosphere, a main steam-valve provided with separate supply-communications to said inlet-passage and to said high-pressure cylinder, and constructed to simultaneously admit high-pressure steam to said inlet-passage and to said high-pressure cylinder, a high-pressure exhaust-pipe communicating with said connecting pipe or receiver on the high-pressure side of said valve-case, a valve for controlling the communication through said high-pressure exhaust-pipe, an auxiliary valve adapted to admit an additional supply of high-pressure steam to said connecting pipe or receiver on the low-pressure side of said valve-casing, and means for connecting said high-pressure exhaust-valve to said auxiliary valve, substantially as herein described, for the purposes set forth.

4. In a compound engine, the combination of a pipe or casing 7, arranged to form part of a pipe or passage for conveying exhaust-steam from a high to a low pressure cylinder, a cylindrical guide 4, in communication at one end with the atmosphere and provided with steam-inlet 5 and outlet opening or port 4^a for high-pressure steam, plunger 1, with part 1^a and with a slot 16, an intercepting-valve 6, and a pin 15, connecting said intercepting-valve to said plunger, and a main steam-valve 5^a, adapted, when opened, to simultaneously admit high-pressure steam both to the steam-chest of the high-pressure cylinder and to said steam-passage 5, said plunger 1 being arranged to work in said guide 4 and subject at one end to the pressure of steam in said casing 7 and at the other end to the pressure of the atmosphere, and said part 1^a being adapted to close said opening or port 4^a when the intercepting-valve is opened, substantially as herein described, for the purposes set forth.

5. In a compound engine, the combination of a pipe or casing 7, arranged to form part of a pipe or passage for conveying exhaust-steam from a high to a low pressure cylinder, a cylindrical guide 4 in communication at one end with the atmosphere, and provided with steam-inlet 5 and opening or port 4^a for high-pressure steam, plunger 1, with part 1^a, adapted to close said opening or port 4^a, and with a slot 16, said plunger 1 being arranged to work in said guide 4 and subject at one end to the pressure of steam in said casing 7 and at the other end to the pressure of the atmosphere, an intercepting-valve 6, pin 15, connecting said intercepting-valve to said plunger, a main steam-valve 5^a, adapted, when opened, to simultaneously admit high-pressure steam both to the steam-chest of the high-pressure cylinder and to said steam-passage 5, a high-pressure exhaust-pipe 8, and high-pressure exhaust-valve 9 for controlling the passage between said pipe 8 and said pipe or casing 7, substantially as herein described, for the purposes set forth.

6. In a compound engine, the combination of a pipe or casing 7, arranged to form part of a pipe or passage for conveying exhaust-steam from a high to a low pressure cylinder, a cylindrical guide 4 in communication at one end with the atmosphere and provided with steam-inlet 5 and opening or port 4^a, plunger 1, arranged to work in said guide 4 and subject at one end to the pressure of steam in said casing 7 and at the other end to the pressure of the atmosphere, and provided with part 1^a, adapted to close said opening or port 4^a, and with a slot 16, an intercepting-valve 6, pin 15, connecting said intercepting-valve to said plunger, a main steam-valve 5^a, adapted, when opened, to simultaneously admit high-pressure steam both to the steam-chest of the high-pressure cylinder and to said steam-passage 5, an auxiliary steam-valve to admit additional high-pressure steam for use in said low-pressure cylinder, high-pressure exhaust-pipe 8, high-pressure exhaust-valve 9, valve-rod 10, with pin 14, forked lever 11, shaft or pin 12, and arm 13, said arm 13 being connected with said auxiliary steam-valve, substantially as herein described, for the purposes set forth.

405,570. COMPOUND LOCOMOTIVE-ENGINE. RICHARD H. LAPAGE, Westminster, England. Filed Dec. 30, 1887. Serial No. 259,430. (No model.)



Claim.—1. In a compound locomotive-engine, the combination of a high-pressure cylinder or cylinders mounted upon the locomotive proper, a low-pressure cylinder or cylinders mounted upon a bogie or vehicle connected to said locomotive proper, pipes or passages connecting said high and low pressure cylinders, and a ball-and-socket joint between said pipes, said ball-and-socket joint forming a pivot for said bogie or vehicle and comprising a ball 15 and a socket 16, one of these parts being secured to said locomotive proper and the other to said bogie or vehicle, substantially as herein described.

2. In a compound locomotive-engine, the combination of a high-pressure cylinder or cylinders mounted upon the locomotive proper, a low-pressure cylinder or cylinders mounted upon a bogie or vehicle connected to said locomotive proper, pipes or passages connecting said high and low pressure cylinders, a ball-and-socket joint connecting said pipes or passages, forming a pivot for said bogie or vehicle, and comprising a ball 15 and a socket 16, one of these being connected to said locomotive proper and the other to said bogie or vehicle, and a sliding or telescopic joint 19 between parts of said pipes or passages, substantially as herein described, for the purpose specified.

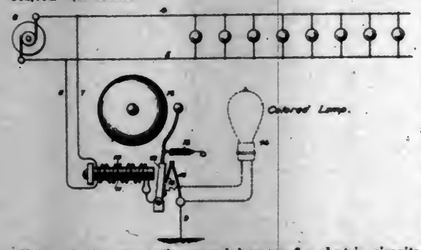
3. In a compound locomotive-engine, the combination of high-pressure cylinders 1 and 2, mounted upon the main frame 3 of the locomotive, low-pressure cylinders 4 and 5, mounted upon a bogie-truck or swivel-frame 6, pipes or passages 9 and 10, connecting said high and low pressure cylinders, hollow ball 15 and parts 16, forming a ball-and-socket joint between parts of said pipe or passage 10 and an exhaust-pipe, one part of said ball-and-socket joint being carried by the main frame and the other part by the bogie-truck or swivel-frame, substantially as herein described, for the purpose specified.

4. In a compound locomotive-engine, the combination of high-pressure cylinders mounted upon the main frame of the locomotive, low-pressure cylinders mounted upon a bogie-truck or swivel-frame, pipes or passages 9 and 10, connecting said high and low pressure cylinders, a ball-and-socket joint connecting parts of said pipe 10, a telescopic joint 19, arranged between parts of said connecting-pipe 10, and exhaust-pipe constructed in two parts 13 and 13^a, said parts being connected with each other by a working-joint and placed in communication with each other by a pipe 13^b, arranged above the ball-and-socket joint, substantially as described, for the purposes specified.

405,571. MUFFLE FOR GLASS AND EARTHEN WARE. LEWIS LAWTON, FREDERICK SWANN, and WILLIAM R. WHITEHEAD, Chambersburg, N. J.; said Lawton assignor to said Swann and Whitehead. Filed Feb. 9, 1888. Serial No. 263,549. (No model.)

Claim.—1. A muffle provided with external hot-air and cold-air flues encompassing different portions of said muffle, whereby different degrees of heat may be maintained in said portions, substantially as described.

2. A muffle externally heated and provided with cold-air flues encompassing a portion of it, said flues communicating at opposite ends with the external air, substantially as described.



3. A continuous muffle provided at one end with external cold-air flues and at the portion adjacent to said end with external heat-flues, substantially as described.

4. A continuous muffle provided at one end with cold-air flues and at the portion adjacent to said end with heat-flues, said heat-flues extending to the opposite end of the muffle, substantially as described.

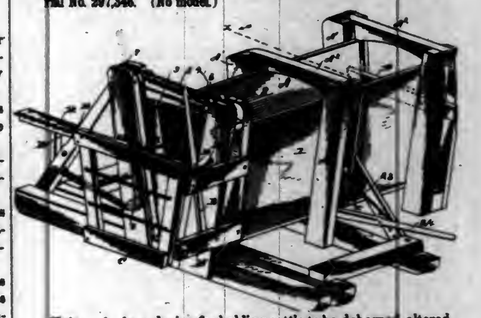
5. A continuous muffle provided at one end with cold-air flues and at the portion adjacent to said end with heat-flues extending as up and down draft flues to the opposite end of the muffle and encompassing the muffle, substantially as described.

6. A muffle provided with external hot-air and cold-air flues encompassing different portions of said muffle, and a removable partition between the cooling and heating portions of the muffle, substantially as described.

405,572. GROUND-DETECTOR FOR ELECTRIC CIRCUITS. OSBORN P. LOOMIS, Somerville, Mass., assignor to the Loomis Electric Manufacturing Company, New York, N. Y. Filed Mar. 11, 1889. Serial No. 302,764. (No model.)

Claim.—1. An automatic ground-detector for electric circuits, consisting in the combination, with the main line, of a detector-line having a normal ground thereon and connecting the respective sides of the said main line, a differential electro-magnet included in the said detector-line, an armature for said magnet, and a ground indicating or signaling device controlled by said armature and operated thereby upon accidental grounding of the said main line, substantially as and for the purpose set forth.

2. An automatic ground-detector for electric circuits, consisting in the combination, with the main line, of a detector-line normally grounded and connecting the respective sides of the said main line, a core of magnetic metal about which said detector-line is wound and returned on itself to form a differential winding, an armature for said core, and a ground indicating or signaling device governed by said armature, which causes the device to be operated by a differential action in the magnet consequent upon a ground occurring on the main line, substantially as and for the purpose set forth.



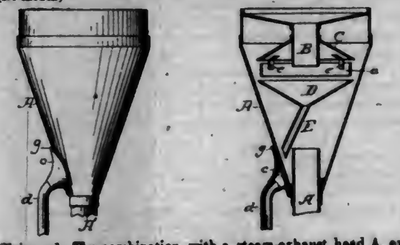
3. In an automatic ground-detector, the combination, with the main line 4 5, of the detector-line 7 8, having a normal ground-connection 9 and connecting the sides of the main 4 5, the differential magnet 10, having armature 12 and included in the said dector-line 7 8, and the ground signaling device 14, controlled by said armature 12 and operated thereby upon a differential action of the said magnet consequent upon an accidental ground on the said main line, substantially as and for the purpose set forth.

405,573. PROCESS OF MANUFACTURING DEXTRINE CORN-MALT. EUGENE M. LOUIS, Havana, Ill. Filed Nov. 15, 1888. Serial No. 290,942. (No specimens.)

Claim.—1. The herein-described process for producing corn-malt, consisting in first soaking and sprouting the grain, then crushing in a moist state to a coarse meal, then steaming, and subsequently drying by heat, cooling, and grinding, and finally drying by exposure to the air, these steps occurring in the order mentioned.

2. In a process for producing corn-malt, the crushing in a moist state of the malted grain and the subsequent steaming thereof in a closed space prior to drying and grinding, substantially as and for the purpose specified.

405,574. DEVICE FOR HOLDING CATTLE TO BE DEHORNED. JESSE F. LOSE and JOHN W. LOSE, Ross, Iowa. Filed Jan. 24, 1889. Serial No. 297,346. (No model.)

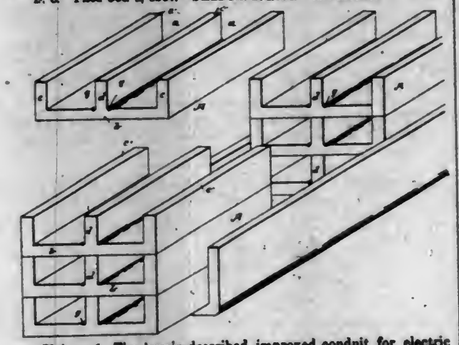


Claim.—1. In a device for holding cattle to be dehorned, altered, or branded, the combination of the chute, the pivoted jaws in front of the same, the ropes connected with the jaws, the lever connected with the ropes, the pawl and rack-plate, a lever pivoted to a projection on the side of the chute, a rope connected with the lever, a hook on the rope, and a clevis on one of the jaws to be engaged by the said hook, substantially as and for the purpose specified.

2. In a device for holding cattle to be dehorned, altered, or branded, the combination of the chute, the pivoted jaws in front of the same, the ropes connected with the jaws, the lever connected with the ropes, the pawl and rack-plate, projections on the side of the chute, a lever pivoted to one of the projections, a rope connected with the lever, a hook on the rope, a clevis on one of the jaws to be engaged by the said hook, and a gate hinged to the said projections, substantially as and for the purpose specified.

3. In a device for holding cattle to be dehorned, altered, or branded, the combination of the chute, the pivoted jaws in front of the same, the ropes connected with the jaws, the lever connected with the ropes, the pawl and rack-plate, projections on the chute, a lever pivoted to one of the said projections, a rope connected with the lever, a hook on the rope, a clevis on one of the jaws to be engaged by the said hook, a gate hinged to the said projections, a belt secured within the chute, and a lever for operating the said belt, substantially as described.

4. In a device for holding cattle to be dehorned, altered, or branded, the combination of the chute, the pivoted jaws in front of the same, the ropes connected with the jaws, the lever connected with the ropes, the pawl and rack-plate, projections on the chute, a lever pivoted to one of the said projections, a rope connected with the lever, a hook on the rope, a clevis on one of the jaws to be engaged by the said hook, a gate hinged to the said projections, a belt secured within the chute, a lever for operating the said belt, and a lever pivoted at the rear end of the chute to prevent the animal escaping, substantially as described.

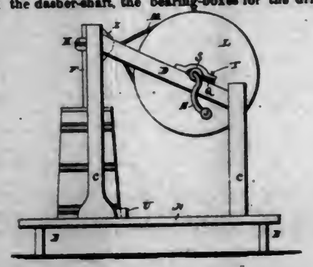


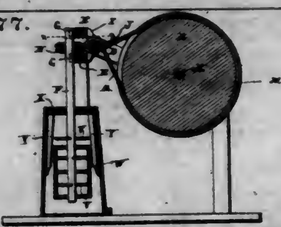
405,575. STEAM-EXHAUST HEAD. EDWARD P. LYMAN and JAMES P. WARREN, Chicago, Ill. Filed Feb. 23, 1889. Serial No. 300,826. (No model.)

Claim.—1. The combination, with a steam-exhaust head A, exhaust-pipe A', exit-pipe B, and drip-pipe *d*, of the upper deflector C, the lower deflector D, having a drain E leading from the inverted apex thereof, and the annulus suspended between the circumferential edges of said deflectors, as set forth.

2. The combination, with an exhaust-head, exhaust-pipe A', and exit-pipe B, of the drip-pipe, bell-shaped connecting-plate thereof, and the rim-plate secured around and bordering the hole in the lower end of said head, through which the products of condensation pass in transit to said drip-pipe and which has its outer surface adjacent to its inner edge rabbeted, as set forth.

405,576. ELECTRIC-WIRE CONDUIT. JOHN LYNCH, Washington, D. C. Filed Oct. 1, 1887. Serial No. 251,161. (No model.)



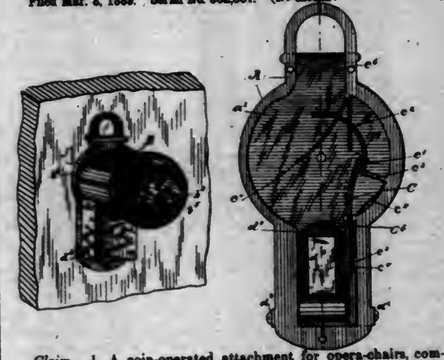


Claim.—1. The herein-described improved conduit for electric wires, comprising a series of superimposed sections consisting each of a base recessed at its corners and side and central vertical ribs, the former having upper curved edges, substantially as set forth.

2. The combination, in a terra-cotta conduit for electric wires, of an inclosing case or tube having a gutter to carry off moisture, a series of superimposed sections built up within said case and having each a central vertical rib, and longitudinal ducts or passages on either side of said rib, substantially as set forth.

405,577. CHURN. HENRY R. LYNES and EZRA T. LYNES, Wichita, Kans. Filed Jan. 25, 1889. Serial No. 297,594. (No model.)

Claim.—1. The combination of the supporting-frame, the dasher-shaft mounted therein, the driving-shaft, the idler between the driving-shaft and the dasher-shaft, the bearing-boxes for the driving-shaft,



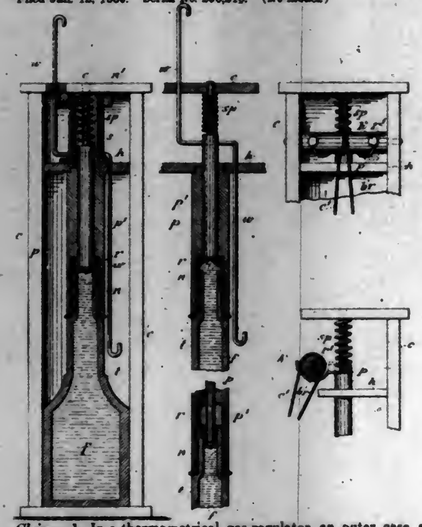
consisting of metallic straps bent to form the bearing-loops for the driving-shaft, and the arms extending from said loops and provided with a series of perforations, the keeper-plates secured on the upper side of the supporting-frame and passing over the bearings for the driving-shaft, and the securing-pins passed through the said keeper-plates and one of the perforations in the arms of the bearings for the driving-shaft, as specified.

2. The combination of the frame, the bearing-boxes thereon, consisting of straps doubled on themselves to form bearing-loops, and arms extending from said loops, the keeper-plates secured to the frame and extending over the bearing-boxes, and the pins passing vertically through the ends of the keeper-plates and through the arms of the bearing-boxes into the frame, substantially as specified.

405,578. COIN-OPERATED RECEPTACLE. WILLIAM MACHAMAR, Indianapolis, Ind., assignor of one-half to Wm. H. Hubbard, same place. Filed Mar. 8, 1889. Serial No. 302,507. (No model.)

Claim.—1. A coin-operated attachment for opera-chairs, comprising a frame, a tubular confection-receptacle fixed thereto, with a pivoted tubular portion telescoping it, and mechanism located at the rear of and within the frame to lock and hold the tubular portions with relation to each other, substantially as and for the purpose described.

2. In a coin-operated attachment for opera-chairs, the frame A, recessed at the back and provided with a pivoted spring-actuated lever C, the confection-receptacle consisting of the telescoping tubes $B' B^2$, one of which is pivoted and has a catch to be engaged by the lever C aforesaid, and the hinged coin-receptacle D, all arranged substantially as described, and for the purpose set forth.

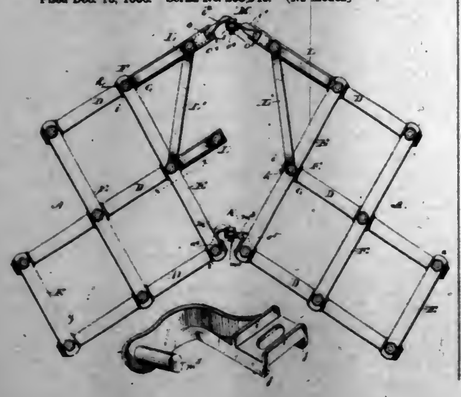


3. In a coin-operated receptacle, the frame A, recessed at the back, as shown, to form a coin-chute, and provided with a slot, as described, the vertical lever C, having the hooked upper end and the enlarged lower end, the confection-receptacle secured to the frame having the moving portion B^2, with the catch c' thereon to extend through the slot in the frame and be engaged by the hooked end of the lever, and the spring c^4, to retain the lever C in normal engagement with the catch, substantially as described.

4. In a coin-operated receptacle, the combination of the frame A, having the recess a' at the rear thereof and the radial slot c^3 through its web, the tubular metal receptacle constructed in two parts, partially telescoping each other, having portions cut away, as described, the projection c' upon one of said portions extended through the slot c^3, there being a gland b^3 secured to the front of one of the portions, and a pivoted spring-operated lever C, to engage the projection c', and a hinged coin-receptacle, arranged substantially in the manner and for the purpose set forth.

5. The combination, with the frame A, having a portion cut away at its lower end and provided with a confection-receptacle, of the pivoted or hinged coin-receptacle having a projection d' to enter the cut-away portion of the frame, and a projecting arm d^3 to overlap said projection at a distance to carry the coin from its resting-place forward as the coin-receptacle is opened, substantially as set forth.

6. In combination, the frame A, the two-part telescopic confection-receptacle having a glass front, a hinged coin-receptacle, and mechanism, substantially as described, to operate by the weight of a coin to lock the two parts of the confection-receptacle with relation to each other, substantially as described.



405,579. THERMOSTAT. JOHN H. MALLON, Francesville, Ind. Filed Jan. 12, 1889. Serial No. 296,210. (No model.)

Claim.—1. In a thermometrical gas-regulator, an outer case, a vessel for holding the expansible liquid inclosed therein, an elastic nipple covering the mouth of such vessel and provided with a flange which rests upon a shoulder formed upon the neck of the vessel, a pipe having an opening to receive the mouth of such vessel, the lower end thereof abutting against the flanges of the nipple, the upper end of such pipe held in position by a head movable in the outer case, an adjustable sleeve above such head inclosed in the upper part of such case for adjusting and securing such head in position, a plunger moving in said pipe shouldered above to receive a coiled spring for creating a downward pressure upon such plunger, and a rod connected therewith for attachment to the mechanism to be operated upon, all combined substantially as shown and described.

2. In a thermometrical gas-regulator, an outer case *c*, the vessel *l*, inclosed therein, the elastic nipple *n*, closing the mouth of such vessel, the adjustable pipe *p'*, for holding such nipple in position, the spring-plunger *p*, moving in such pipe, the wire *w*, connected to such plunger and operated thereby, provided with a hook at one or both ends for connecting to the mechanism to be operated upon, and the adjusting-sleeve *s*, threaded to receive the nut *n*, held in place between the top of the case and the movable head *h*, all combined substantially as shown and described.

405,580. HARROW. DEWITT C. MARKHAM, Collinsville, N. Y. Filed Dec. 18, 1888. Serial No. 293,246. (No model.)

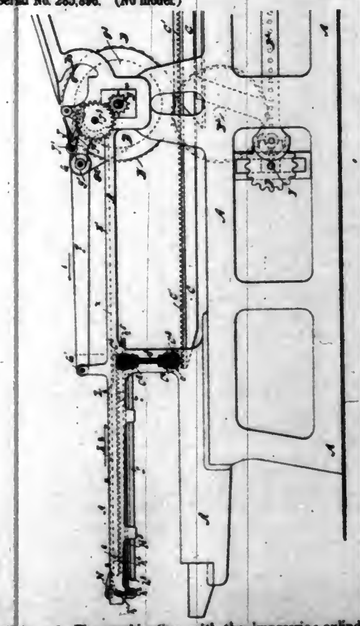
Claim.—1. In a harrow-frame, the combination of a draft-bar, a cross-beam mounted on said draft-bar, and a brace, such as L, for connecting the cross-beam and draft-bar to provide against upward and downward strain of the draft-bar, substantially as described.

2. In a harrow-frame, the combination of a draft-bar, a cross-beam mounted on said draft-bar, and a brace, such as L', connecting the cross-beam and draft-bar diagonally to provide against lateral strain of the draft-bar, substantially as described.

3. A folding harrow-frame having its sections held together by front and rear hinges M N, in combination with the draft-bar and the cross-beam mounted on said draft-bar, the said rear hinge N being a saddle connecting the draft and cross bar, substantially as described.

4. In a sectional harrow-frame, in combination with the draft-bars and the cross-beams, the front hinge M, composed of two parts i' i^2, provided with lugs *o o'*, and one of said parts having a post o^2 and the other a slot o^3, substantially as and for the purpose described.

5. In a harrow-frame, the combination, with the draft-bar, the cross-beam mounted on said part, and the rear hinge N, provided with the saddle having the upward and downward projecting lugs, between which the cross-bar and draft-bar are held, and a bolt and nut for securing the parts together, substantially as described.



405,581. DOOR-SECURER. BENJAMIN F. MARSHALL, Jr., and DANIEL H. RICKERD, York, Nebr.; said Rickerd assignor, by mesne assignments, to S. F. Wagner, same place. Filed Mar. 14, 1889. Serial No. 303,278. (No model.)

Claim.—1. In a door-lock, the combination of the slotted catch-plate affixed to the casing, and the wedge-shaped or tapered key-plate fitting in the slot of the catch-plate and provided with a swinging button or arm to bear at its free end against the surface of the door, substantially as specified.

2. In a door-lock, the combination, with the catch-plate A, bent to form the tooth C and longitudinally slotted, as at B, of the tapered key-plate D, adapted to enter the slot B of the plate A, having serrations *c* formed upon its outer edge for engagement with the outer edge of the slot B, and provided with the pivoted wedging-button E, as and for the purpose specified.

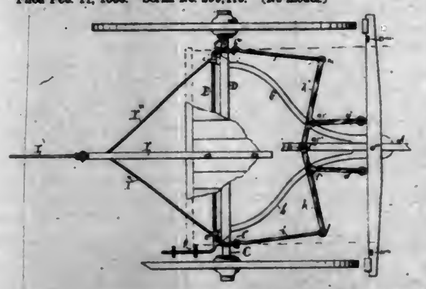
405,582. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. CHARLES R. MASON, Westerly, R. I. Filed Sept. 20, 1888. Serial No. 285,896. (No model.)

Claim.—1. The combination, with the impression-cylinder of a printing-press, of the traveling tapes F, receiving the printed sheet from the cylinder, the delivery-table E, reciprocating independently of and back and forth below the tapes, and on its forward movement receiving the printed sheet from the forward portion of the tapes, and a receiving-table I, for receiving the sheet from the delivery-table, substantially as described.

2. The combination, with the impression-cylinder of a printing-press, of the traveling tapes receiving the printed sheet from the cylinder, and the delivery-table E, reciprocating independently of and back and forth below the tapes and moving at the same speed as the tapes to receive the printed sheet therefrom as said table moves forward from beneath the tapes, substantially as described.

3. The combination, with the traveling tapes F and stationary receiving-table I, of a delivery-table E, reciprocating independently of and back and forth below the tapes, and on its forward movement receiving the sheet from the tapes, and means, substantially as described, for retaining the sheet and delivering it to the receiving-table when the delivery-table moves backward below the tapes, substantially as described.

4. The combination, with the traveling tapes F and receiving-table I, of a delivery-table E, reciprocating back and forth below and independent of the tapes and receiving the sheet therefrom, and gripper-fingers, one of which is opened and closed positively by the movement of the table, substantially as described.



5. The combination, with the traveling tapes F, of a delivery-table E, reciprocating independently of the tapes and grippers H H', one of which is swung to a closed position by the table when at or near the end of its forward movement and to an open position by said table when at or near the end of its backward movement, substantially as described.

6. The combination, with the reciprocating delivery-table E, of the stationary gripper H, the movable gripper H', the lever H^2, the rod H^3, secured thereto, and the dogs h^4 h^5 thereof, adapted to be engaged by the delivery-table, substantially as shown and described.

7. The combination, with the impression-cylinder and type-bed, of the tape-rollers G G', one rotated by a gear-connection with the cylinder, the tapes F, extending around and moved by the rollers, the delivery-table E, reciprocated back and forth independently of the tape and tape-rollers, and grippers H H', one of which is swung to both its open and closed positions by the action of the delivery-table, substantially as described.

8. The combination, with the impression-cylinder and reciprocating type-bed of a printing-press, of traveling tapes driven by gear-connection with the cylinder, a delivery-table reciprocating below and independent of the tapes and operated by a gear-connection with the type-bed, a receiving-table, and grippers for retaining the sheet as the table moves backward, substantially as described.

405,588. WAGON-BRAKE. WILLIAM H. MEARS, Riverton, Iowa. Filed Feb. 11, 1889. Serial No. 299,419. (No model.)

Claim.—1. In a wagon-brake, the combination of a rock-shaft having a lever extending vertically and arms extending downward and supported in bearings located in rear of the rear axle, two levers pivoted in front of the same axle to extend outward and connected with the arms of the rock-shaft, and a brake-bar carrying wheel-rubbing devices on its ends and connected with the outer ends of said levers to operate in the manner set forth, for the purposes stated.

2. A wagon-brake comprising a rock-shaft having two integral arms and an upwardly-extending crank adapted to receive an extension-rod, by means of which said brake is operated, connecting-rods joining said arms to two horizontally-reciprocating brake-levers, and tension-rods connecting said brake-levers to a reciprocating rubber-bar, all substantially as described and set forth.

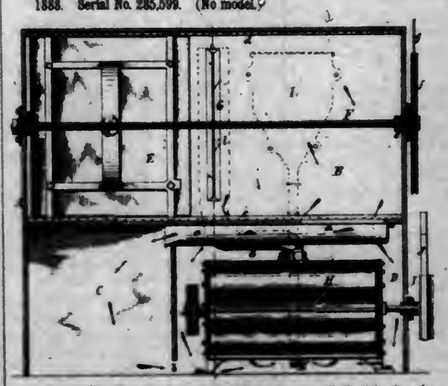
3. The combination, with a rock-shaft provided with dependent arms, of connecting-rods joining said shaft to two pivoted brake-levers, tension-rods uniting the brake-levers to a suitable rubber-bar, and a detachable support at the rear of the wagon-body adapted to carry an actuating-lever, said lever being connected at its lower end, by means of detachable rods, to the arms of said rock-shaft, all arranged and adapted to work substantially as described, and for the purposes set forth.

405,584. SADDLE FOR TOP ROLLS OF SPINNING-MACHINES. GEORGE A. METCALF, Woonsocket, R. I. Filed Aug. 25, 1888. Serial No. 283,728. (No model.)

Brief.—The invention consists in the improved devices for relieving the pressure of the saddle from the middle roll.

Claim.—1. In a saddle for top rolls, the combination, with a saddle composed of two sections, one overlapping the other, of a lever pivoted to one section and contacting with the other section to raise the inner end of one of the sections from contact with one of the rolls, substantially as described.

2. In a saddle for top rolls, the combination of a saddle composed of two sections, one overlapping the other, a bearing projection on one of the sections contacting with the other section, and a lever pivoted to one section and contacting with the other section to raise the inner end of the lower section from contact with one of the rolls, substantially as described.



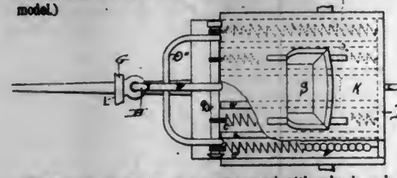
3. The combination of a saddle composed of two sections, one overlapping the other, a bearing projection on the lower section contacting with the overlapping section, a lever pivoted to the outer end of said lower section having a projection for contact with the overlapping section, and a notch in said last-named section, in which the projection may be seated to hold the section in its adjusted position, substantially as described.

4. The combination of the top rolls of a drawing or spinning frame, a clearer for said rolls, a saddle composed of two sections, and a lever pivoted to one of the sections and adapted to contact with the other for simultaneously freeing the middle roll and raising the clearer therefrom, substantially as described.

5. The herein-described saddle for top rolls, composed of two sections, one overlapping the other, the lower one provided with projections extending the lubricating-orifices, and the upper section provided with openings for the passage of the said projections, substantially as set forth.

6. The combination of a saddle composed of two sections, one overlapping the other, the under section provided with projections extending the lubricating-orifices, and the upper section having openings for the passage of said projections, and a lever pivoted to one of the sections and contacting with the other section, whereby the under section is adjusted with respect to the middle roll, substantially as described.

405,585. MACHINE FOR BLACKLEADING THE MOLDS FOR ELECTROTYPES. WARREN MILES, Warnerville, Mass. Filed Sept. 17, 1888. Serial No. 285,599. (No model.)



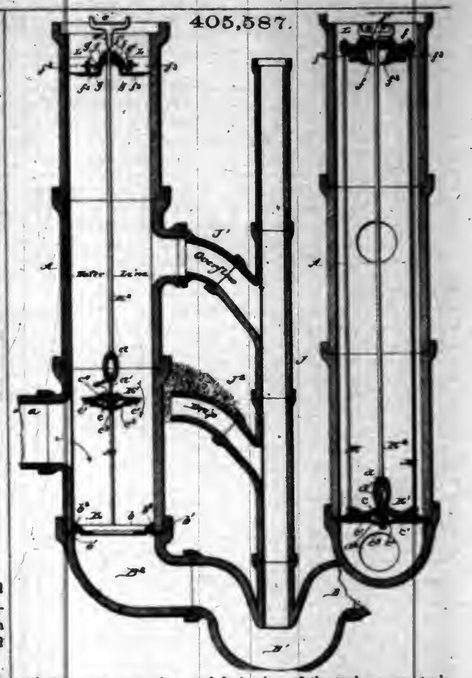
Claim.—1. The combination of the case provided with chambers having passages connecting each with the other, as shown, the carriage supported in guides or ways and connected with mechanism for imparting to it reciprocating rectilinear movements within the case and arranged with a conduit proceeding from a blower, said conduit having a long narrow mouth, as shown, with said conduit and blower, the latter being connected with mechanism for putting it in operation, and the blower-chamber having a pipe to convey the black-lead to

the blower, all being arranged and to operate essentially as set forth and represented.

2. The combination of the case provided with chambers and having arranged and supported therein a carriage connected with mechanism for imparting to said carriage reciprocating rectilinear movements therein for the purpose described, with the blast-blower arranged within said chamber and having a conduit to convey air mingled with black-lead forced by said blower into the conduit and through the slit *l* with sufficient force against the mold as it passes said slit to securely deposit a coating of the lead on the face of the mold, essentially as set forth and represented.

3. The conduit G, provided with the long narrow mouth or slit, as shown, to discharge air mingled with black-lead, forced into said conduit by the blower, into the case and against the mold, as described, in combination with the case having arranged therein the mold-sustaining carriage provided with mechanism for imparting to it reciprocating rectilinear movements in front of said slit, the blower connected with the conduit G, also provided with mechanism for operating it, and the pipe K, opening into the chamber and provided with gates and a hopper, substantially as set forth and represented.

405,586. DRAFT ATTACHMENT FOR VEHICLES. CHARLES E. MILLER, Syracuse, N. Y. Filed Feb. 2, 1889. Serial No. 298,519. (No model.)



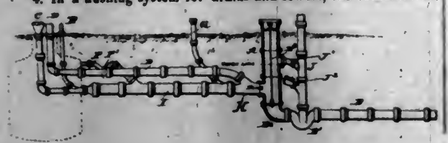
Claim.—1. A towing-cart constructed with wheels, axle, and flooring, upon which are supported springs and safety-chains connected at their ends to the cart and to a draft-bar, in combination with a hook A, secured to the cart for connecting the tow-line, all constructed substantially as described and shown.

2. A towing-cart constructed with wheels, axle, and flooring, springs and safety-chains resting thereon, said springs being connected at their ends to the cart and to the draft-bar D, vertical partitions separating said springs, and a seat for the driver above the same, all constructed substantially as described and shown.

3. A towing-cart provided with a draft-bar D, springs C C, connected thereto and to the cart, safety-chains passing through said springs and connected in like manner, vertical partitions separating said springs, and hooks for the attachment of the whiffletrees and tow-line, all constructed and combined substantially as described and shown.

4. In a draft attachment, the combination of a draft-bar, springs, and safety-chains connected thereto and to a cross-bar to which the tow is connected, all constructed and arranged substantially as described and shown.

405,587. FLUSHING SYSTEM FOR DRAINS AND SEWERS. HIRAM W. MCDONALD and THOMAS W. SEUBE, Bucyrus, Ohio. Filed July 26, 1888. Serial No. 281,144. (No model.)

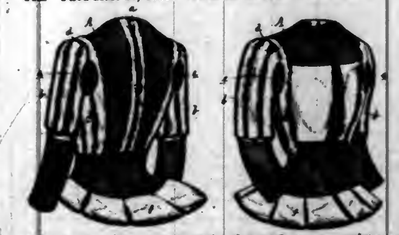


Claim.—1. In a flushing system for drains and sewers, the combination of the waste-water pipes, a tank or receptacle connecting with the drain-pipe, and a relief-pipe, also connecting with the drain-pipe and having an overflow-pipe connection with the tank or receptacle, as also a drip-pipe, substantially as set forth.

2. In a flushing system for drains and sewers, the combination of the tank or receptacle A, the flanged coupling B^3, and the valve-seat K, secured between the lower end of the receptacle and the coupling and provided with the annular conical ridge *b* adjacent to the outer edge or flange *b'* of the valve-seat and of slightly less diameter than the receptacle, substantially as described, whereby a packing-seat is formed between the ridge and the inner surface of the receptacle, as set forth.

3. In a flushing system for drains and sewers, the combination, with the waste-water pipes and drain-pipe, of the tank or receptacle provided with a valve and guide-rods, said guide-rods passing through apertures in said valve and connecting with the valve-seat and a bracket in said tank or receptacle, substantially as set forth.

4. In a flushing system for drains and sewers, the combination,

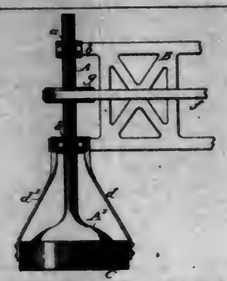


with the waste-water pipes and drain-pipe, of the tank or receptacle provided with a valve having its stem or rod passing through and having a screw-threaded connection with a bracket provided with segmental clamp-blocks adjustable to and from the inner side of the tank or receptacle, substantially as set forth.

5. In a flushing system for drains and sewers, the combination, with the waste-water pipes and drain-pipe, of the tank or receptacle provided with the valve, the stem or rod of which passes through a bracket having a plate provided with stepped portions upon which are supported segmental clamp-blocks, screws having swiveled connection with said blocks and stepped portions of the bracket, and nuts working upon said screws, substantially as described.

6. In a flushing system for drains and sewers, the combination, with the tank or receptacle, of the bracket consisting of a plate provided with a central bushing-like block and with stepped-like portions, segmental clamp-blocks supported upon said stepped portions of the plate, and screws swiveled to said blocks and working in said stepped portions of the plate, and nuts fitted upon said screws, substantially as specified.

405,588. PADDED UNDERWAIST. MARY D. MCDOWELL, Denton, Tex. Filed Mar. 27, 1889. Serial No. 304,925. (No model.)



Claim.—As an improved article of manufacture, a waist provided upon its inner surface with pockets extending down the middle of the back, on the breasts, around the lower edge, down the sleeves, and down the sides beneath the arms, the pockets down the sleeves and beneath the arms being united together, and all of said pockets provided with soft padding, substantially as shown and described.

405,589. POLISHING-MACHINE. WILSON MCQUISTON, Fort Wayne, Ind. Filed June 18, 1888. Serial No. 277,494. (No model.)

Claim.—In a polishing-machine, a circular band surrounding the

405,589.

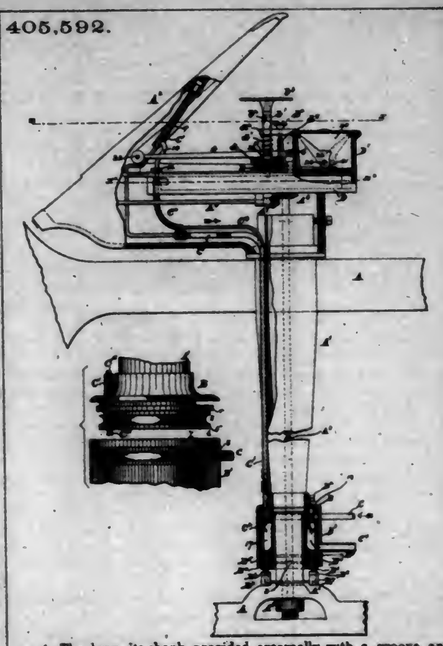
polishing-head and connected to the frame holding the polishing-shaft by means of oblique braces rigidly attached to the band, having in the upper ends vertical slots, and attached to said frame by set-bolts through said slots, substantially as described.

405,590. PROCESS OF MAKING PAPER BAGS. ALBERT E. OSBORN, Brooklyn, N. Y. Filed Mar. 23, 1889. Serial No. 304,415. (No model.)

Claim.—The hereinbefore-described method of manufacturing paper bags, which consists in, first, creasing the flat paper blank crosswise or transversely from side to side at distances equal to the desired length of the bag; secondly, forming this creased blank or web into a tube, and, thirdly, severing this tube into sections of proper length, each containing one of the transverse creases, and forming the bags by closing the ends of said sections in the usual manner, substantially as and for the purpose set forth.

405,591. CHURN. JOHN W. PARRISH, Milton, W. Va. Filed Dec. 17, 1888. Serial No. 293,582. (No model.)

Claim.—In a churn, the combination of the body, a flange formed thereon, a hinged frame on the body, the lower end of which is held in place by the said flange, a dasher-shaft having its upper end formed into a spiral, arms carrying a disk provided with a threaded thimble to engage the threaded portion of the dasher-shaft, a dasher on the lower end of the arms, a yoke on the upper end, and a crank-shaft mounted in the hinged frame and engaging the yoke, whereby, when the said yoke is operated, a rotary-reciprocating motion will be imparted to the dasher-shaft and a vertically-reciprocating motion to the dasher, substantially as described.



405,592. WAX-HEATING DEVICE FOR SEWING-MACHINES. GEORGE R. PEARE, Lynn, assignor of one-half to Edwin L. Sprague, Boston, Mass. Filed Apr. 24, 1888. Serial No. 271,667. (No model.)

Claim.—1. The rotating horn of a sewing-machine, and a steam-joint surrounding the shank of the said horn, combined with a wax-chamber, and pipes or passages to lead steam from the said steam-joint to the horn, and thence to the said wax-chamber to melt the wax therein, and with return pipes or passages leading therefrom, substantially as described.

2. The horn and the steam-joint consisting of the loosely-supported part B', having internal shoulders 6 and 7, and the part B, rigidly attached to the horn-shank and having shoulders 4 and 5, which are seated on internal shoulders, the said parts having an annular steam-channel 8 between said shoulders, as described, combined with pipes to conduct steam from the said channel into the upper portion of the horn and to return the same more or less condensed into the part B' below said steam-channel, substantially as described.

3. The horn-shank, its rigidly-attached part B, and the tipping part B', surrounding the horn-shank loosely, and having the chamber 17 for reception of water of condensation, the part B being fitted into the said part B' to form a balanced joint, combined with a return-pipe extended through the part B into the said chamber in the part B', and an outlet therefor, substantially as described.

405,592.

4. The horn, its shank provided externally with a groove, and the shank-bearing, combined with the part B of the steam-joint and with the direct and return pipes connecting said joint and horn, and extended through the bearing in the said groove, substantially as described.

5. The rotating horn, combined with the wax-chamber and the hollow base carrying the same, and pivoted to the horn eccentric to the center of rotation thereof, to be turned aside therefrom, substantially as described.

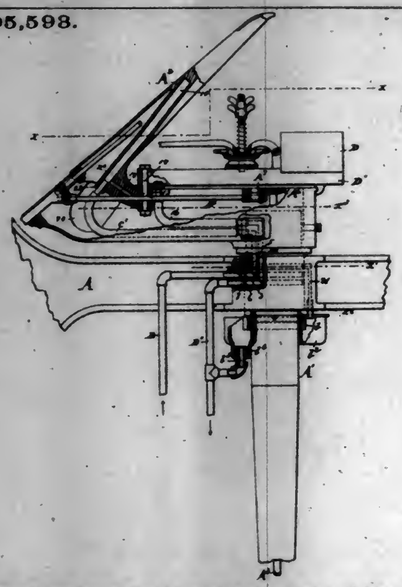
6. The horn, the hollow ported base D, pivoted thereon, the wax-chamber, and the take-up lever pivoted on the said base and having a sheave extended into the space in the said horn, whereby by turning the said base the said sheave may be moved out from and into the said horn, substantially as described.

7. The horn, the hollow ported base D, and the wax-chamber thereon provided with a partition having an opening, combined with a valve to open or close the said opening, substantially as described.

8. The horn, and the steam-pipe to lead steam into the upper end of the horn, combined with the pipe portion 9, having its upper end inserted firmly into the metal of the horn, the steam-pipe being extended through the said pipe portion, which is closed at its lower end immediately about the steam-pipe, the pipe portion 9 being in communication with the portion forming part of the return-pipe, substantially as described.

9. The horn, its shank, and steam-pipes, combined with the steam-joint and binnacle-rings to support it, substantially as described.

10. The horn, its shank, and steam-pipes, combined with the steam-joint and binnacle-rings to support it, and elastic ring and adjusting-screws, substantially as described.



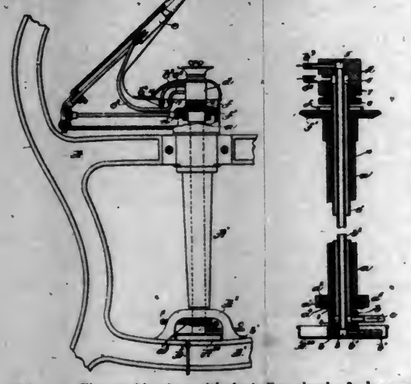
405,593. WAX-HEATING DEVICE FOR SEWING-MACHINES. GEORGE R. PEARE, Lynn, assignor of one-half to Edwin L. Sprague, Boston, Mass. Filed Sept. 10, 1888. Serial No. 285,021. (No model.)

Claim.—1. In a sewing-machine, the combination, with a horn and its spindle provided with annular grooves and connecting-passages therein for direct and return heating-fluid, of a fluid-supply pipe and a fluid-return pipe each communicating at all times with said direct and return grooves, respectively, to operate substantially as described.

2. In a sewing-machine, the combination, with a horn and its spindle provided with peripheral grooves and connecting-passages therein for direct and return heating-fluid, of a fluid-supply pipe and a fluid-return pipe connecting with said direct and return grooves, respectively, and with a drip-collar and drip-cup having a trap therein, substantially as described.

3. In a sewing-machine, the combination, with a horn and its spindle provided with grooves and passages for direct and return heating-fluid, of a fluid-supply pipe and a fluid-return pipe, and with

405,593.



a drip-collar and drip-cup, and connections between the said drip-cup and the said return-pipe, substantially as described.

4. The horn, its spindle provided with the annular groove 20, and the horn-bearing and its discharge-port 21 in communication with said groove 20, combined with the drip-cup b^3, connected with the port 21, substantially as described.

5. The horn having the opening 24 and the passage 10 therein, combined with the pipe c', inserted in said passage, and nut 25 to hold it firmly therein, to operate substantially as described.

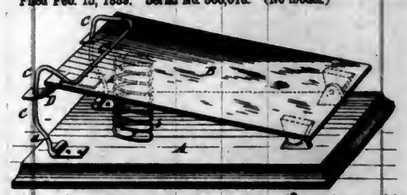
405,594. HORN-HEATING DEVICE FOR WAX-THREAD SEWING-MACHINES. GEORGE R. PEARE, Lynn, assignor of one-half to Edwin L. Sprague, Boston, Mass. Filed Dec. 18, 1888. Serial No. 293,941. (No model.)

Claim.—1. The combination, with the hollow shank of a horn, of a system of steam-pipes arranged in the line of the center of rotation of the horn and extended into the arm of the horn, whereby the horn may be heated by steam and yet permit the horn to be revolved freely, substantially as described.

2. The rotating horn having a hollow shank, combined with a hollow shaft, as a, and with a system of pipes extended through the said hollow shaft, and having extensions to lead the heating medium into the arm of the horn and conduct it therefrom back through the said shaft, substantially as described.

3. The combination, with the horn and its hollow shaft a, and its gear a^2 and screw a', to secure it, of the ring a^4, having a notch to engage a projection from the said shaft, and with means to secure the ring to the gear, substantially as described.

405,595. DEVICE FOR PACKING BUTTER, &c. JOHN C. PEPPLER, Bloomingdale, Ontario, Canada. Filed Aug. 4, 1887. Serial No. 246,140. (No model.) Patented in Canada Aug. 13, 1887, No. 27,429.

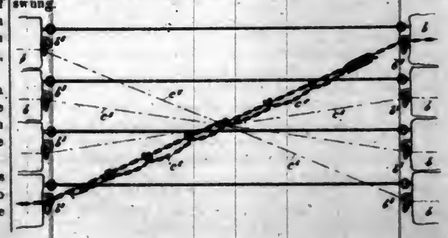


Claim.—1. The combination, with a keg formed with a shoulder on the inside thereof and grooved side pieces attached to the interior thereof, of a prismoidal metal case having its vertical corners seated in the grooves of said side pieces, a close-fitting cover for said case, ribs on the top and bottom of said case, a head for the keg, and an elastic strip on the rim of said head engaging the shoulder of the keg, and clamp-rods for holding the top and bottom of the keg in place, substantially as and for the purpose specified.

2. The combination of the prismoidal metal case B, which incloses the material to be packed, and having cover F, frame-piece A around the top of said case, with a space between the two for the flange of the cover, and upper and lower ribs f, the grooved guides d', fixed inside the keg A, a space for a cooling substance being left between the sides of the metal case B and the inside of the keg A, the head of which is rigidly held in place, so as to form a tight joint, substantially as specified.

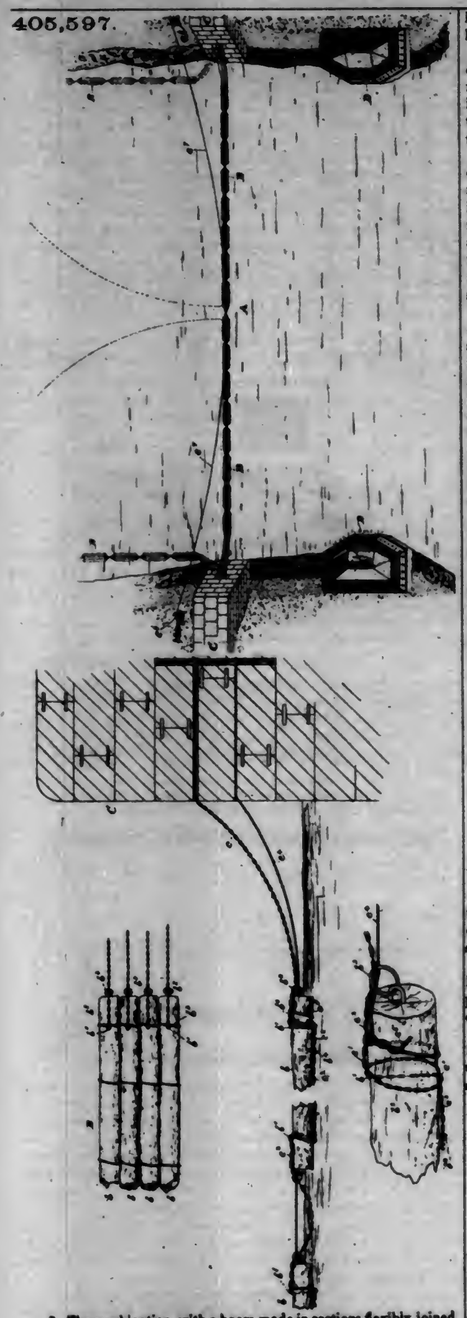
3. The combination, with the keg, its top and bottom, and the metal case within said keg, and provided with the ribs f, of the metal strips H, secured to said top of the keg, the rods passed through the top and bottom, and the finger-nuts d on one end of said rods, substantially as and for the purpose specified.

405,596. PAPER-FILE. BERNHARD PETSCHE, Philadelphia, Pa. Filed Feb. 15, 1889. Serial No. 300,018. (No model.)



Claim.—1. The combination of a base plate or frame, a hinged and spring-cushioned supporting-plate, a clamping device hinged to the base-frame and bent at its upper part so as to extend over the head of the supporting-plate, and arms attached to the supporting-plate and adapted to engage said clamp, so as to oscillate it when the supporting-plate is depressed, substantially as set forth.

2. The combination of a base plate or frame, a hinged and spring-cushioned supporting-plate applied to said base-plate, a clamping device hinged to the base-plate and provided with a bent upper part extending over the head of the supporting-plate and with shanks having forwardly-bent lower portions, and of arms attached to the supporting-plate and adapted to engage the shanks of the clamping device, substantially as set forth.



405,597. BOOM. THOMAS RAFFERY, New York, N. Y. Filed Sept. 28, 1888. Serial No. 286,411. (No model.)

Claim.—1. A gate-boom or raft-gate, made in two parts detachably connected, consisting of buoyant sections flexibly joined, both parts capable of being swung to open or close the boom.

2. The combination, with abutments, of a gate-boom or raft-gate, consisting of buoyant sections flexibly connected, the boom being made in two parts detachably joined, each part capable of being swung.

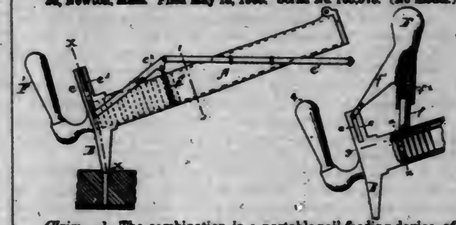
405,597.

3. The combination, with a boom made in sections flexibly joined, of a supplemental cable joined to the sections and means for pulling upon the cable, substantially as and for the purpose set forth.

4. The combination, with a boom made in one or more parts, of chains joined by fastening in the nature of a cable bend, substantially as described.

5. The combination, with an end section of a boom, of an abutment and chains and cables, the chains and cables being firmly fixed in the abutment, and each chain being attached to a log by a half-hitch, and each cable by a timber-hitch, substantially as described.

6. In a sectional boom, the combination of an end section formed of one or more logs or bundles of logs, each provided with a perforation, of an abutment and of one or more chains, each chain passing to the upper surface of the log, down through the perforation, then being formed in a half-hitch around the log, and passing on along the under surface of the log, substantially as set forth.



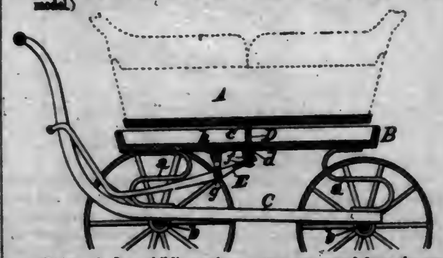
7. In a sectional boom, the combination of an end section formed of one or more logs or bundles of logs, each provided with two perforations, of an abutment and of one or more chains, each chain passing to the upper surface of the log, then down through the first perforation, then formed in a half-hitch around the log, and passing on along the under surface of the log to the second perforation, then up through this perforation, then formed in a half-hitch around the log, and passing on along the upper surface of the log, substantially as described.

8. In a sectional boom, the combination of an end section formed of one or more logs or bundles of logs, the logs of each section being securely lashed or banded together, each log provided with two perforations and with one or more circumferential grooves or collars, of an abutment and of one or more chains, each chain being securely fastened to the abutment and passing to a ring-bolt fixed in the log, then over or under the log to the nearest perforation, then through this perforation and around the log in a half-hitch, then along the log, either guided or not by eye or ring bolts, then through the other perforation to the opposite side of the log, then around the log in a half-hitch, and then along the log to another eye or ring bolt, substantially as described.

9. In a boom formed in sections, the combination, with the sections, of chains and cables, the chains being crossed and the cables being fastened to their respective logs, substantially as set forth.

10. A gate-boom or raft-gate, made in one or more detachable parts formed of buoyant sections flexibly joined by cables and cross-chains, the whole boom or any part capable of being swung to open or close.

405,598. RAIL-FEEDING IMPLEMENT. FREDERICK F. RAYMOND, 2d, Newton, Mass. Filed May 15, 1885. Serial No. 165,573. (No model.)



Claim.—1. The combination, in a portable nail-feeding device, of the nail holder or carrier A, having the hole C, the automatic hole-closing device D, and the reciprocating stripper or plunger E, all substantially as and for the purposes described.

2. The combination, in a portable nail-feeding device, of the nail holder or carrier A, the nozzle B, the reciprocating plunger or stripper E, and the handle F, all substantially as and for the purposes described.

3. The combination, in a portable nail-feeding device, of the nail holder or carrier A, the handle F, the nail stripper or plunger E, and the push-button, knob, or pull for operating the plunger or stripper, all substantially as and for the purposes described.

405,599. CHILD'S CARRIAGE. WILLIAM H. RICHARDSON, Baltimore, Md., assignor of two-thirds to John M. McClintock and Henry T. Maloney, same place. Filed Nov. 12, 1888. Serial No. 290,547. (No model.)

Claim.—1. In a child's carriage, a tray supported from the running-gear, combined with a body provided with a king-bolt which

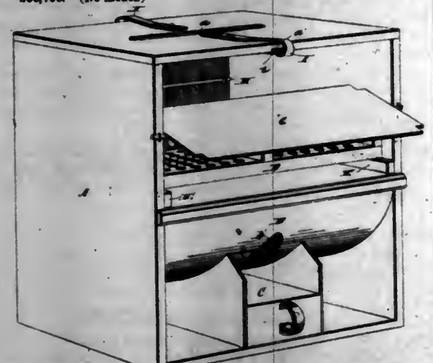
passes through the said tray, and a lever connected to the end of the said king-bolt, whereby the same may be elevated, so as to admit of the body being turned and reversed in position with reference to the running-gear, substantially as and for the purpose specified.

2. In a child's carriage, the body thereof susceptible of a vertical movement from its foundation by means of a king-bolt, which also serves as a pivot of the said body in its reversal with reference to the said running-gear, substantially as and for the purpose specified.

3. As means of elevating the king-bolt D, the lever E, fulcrumed to a pivoted link *g*, and slotted at its end through which the said king-bolt passes, and round-faced collars *f* on the said king-bolt, whereby the change in angular position of the lever in its operation does not deflect the said king-bolt from its vertical position, substantially as and for the purpose specified.

405,600. CHILD'S CARRIAGE. WILLIAM H. RICHARDSON, Baltimore, Md., assignor of two-thirds to John M. McClintock and Henry T. Maloney, same place. Filed Dec. 27, 1888. Serial No. 294,733. (No model.)

Claim.—1. In a child's carriage, the body thereof susceptible of a vertical movement from its foundation, and a rotative motion when in an elevated position, combined with a stop to limit the said rotative motion to less than a full revolution, substantially as and for the purpose specified.



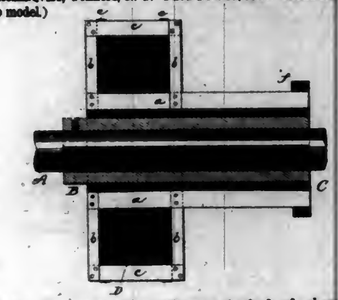
2. In a child's carriage, a platform or tray supported from the running-gear, a body pivoted to the said tray and adapted for elevation within the said tray, combined with a stop to limit its rotation or rotative movement, substantially as and for the purpose specified.

3. The bolt D, having the arms *k*, with the studs *n*, combined with the elevating-lever E, substantially as and for the purpose specified.

4. The bolt D, having the arms *k*, with the studs *n*, the said studs being removed from a diametrical line, combined with the elevating-lever E, substantially as and for the purpose specified.

5. In a child's carriage, the body thereof adapted for elevation within a tray provided with sides formed of rods, and brackets to unite the said rods with the bottom of the said tray, substantially as and for the purpose specified.

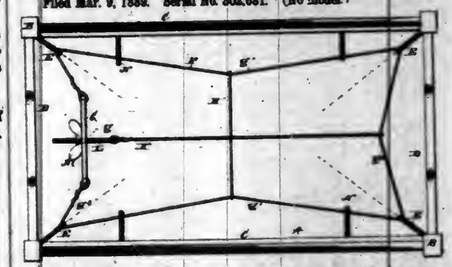
405,601. EGG-TESTER. JOHN L. RITTER, Milnes, Va., assignor of one-half to John P. Brown, same place. Filed Oct. 20, 1888. Serial No. 288,706. (No model.)



Claim.—1. An egg-tester comprising the rectangular frame provided with supporting-strips adapted to receive a tray, the reflector situated beneath the supporting-strips and having the transverse slot or slots, and the hinged doors closing the frame above the supporting-strips, substantially as described.

2. An egg-tester comprising the rectangular frame provided with an eye-hole and supporting-strips adapted to receive a tray, the reflector situated beneath the supporting-strips and having the transverse slot or slots to allow the light or lights to be placed in the middle of the reflector, the hinged doors closing the frame above the reflector, and spring-catches engaging the doors, substantially as described.

3. An egg-tester comprising the rectangular frame provided with supporting-strips adapted to receive a tray, the reflector situated beneath the supporting-strips and having the transverse slot or slots, and the hinged doors and the spring-catches, said doors being hinged intermediate of their ends and capable of rotation to bring either end into engagement with a catch, substantially as described.

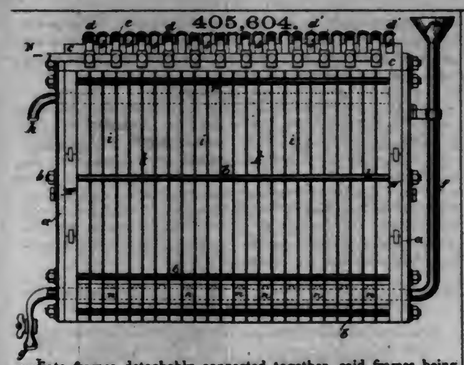


4. An egg-tester comprising the rectangular frame provided with supporting-strips adapted to receive a tray, the reflector situated beneath the supporting-strips, the hinged doors arranged upon each side of the frame and hinged intermediate of their ends and closing the frame above the reflector, and spring-catches consisting of pieces of spring metal carved under the top of the frame and provided with heads adapted to be engaged by either end of the doors, substantially as described.

405,602. DYNAMO-ELECTRIC MACHINE OR MOTOR. CONRAD L. ROSENQVIST, Yonkers, N. Y. Filed Feb. 13, 1889. Serial No. 299,724. (No model.)

Claim.—The combination, with the main shaft, of a sleeve of insulating material thereon, said sleeve being reduced in diameter between its extremities, and an armature made up of coils of copper strips surrounding a core of iron wire, the said wire being wound under tension and bending the copper strips toward the shaft and against the surface of the sleeve, whereby the armature is prevented from slipping off the sleeve.

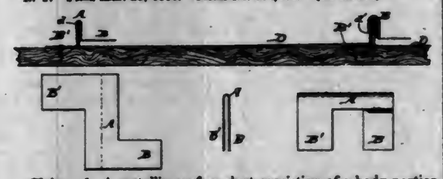
405,608. BEDSTEAD-BRACE. LEANDER F. ROSS, Searcy, Ark. Filed Mar. 9, 1889. Serial No. 302,681. (No model.)



Claim.—As a new article of manufacture, the bedstead-tightener herein described, the same comprising four eyes E, adapted to be screwed into the inner corners of the corner-posts of the bedstead, a single tightening-wire F, rove through said eyes, an apertured plate G, connected at its ends to the ends of said wire and standing adjacent to and parallel with the foot-board D, a cross-wire H, connecting the centers of the side portions *g'* of said wire, a longitudinal wire K, connected at one end to the center of the head portion *g*[a] of said wire, a threaded eyebolt L, connected to the other end of said longitudinal wire, its body passing through the aperture in said plate, and a thumb-nut M, screwed on the outer end of said eyebolt, the whole adapted for use and operation substantially as described.

405,604. PRODUCTION OF COPPER BY ELECTROLYSIS. ALBERTO ROVELLO, Turin, Italy. Filed Apr. 2, 1889. Serial No. 305,681. (No model.) Patented in Italy Sept. 30, 1885, XXXVII, 259, and Mar. 31, 1887, XLI, 386; in France Jan. 27, 1888, No. 173,753, and Sept. 16, 1887, No. 185,873; in Belgium Oct. 5, 1886, No. 74,738, and Sept. 30, 1887, No. 78,910; in Spain Dec. 30, 1887, No. 11,338; in England Aug. 24, 1888, No. 12,206, and in Austria-Hungary Sept. 15, 1888, No. 15,137.

Claim.—1. The herein-described electrolytical apparatus, consisting of a tank or casing formed of two heads and a series of intermediate frames detachably connected together, said frames being provided with porous diaphragms dividing the tank into an equal number of cells, a feed and exhaust duct for each alternate series of cells having its inlet and discharge, respectively, near the bottom of the tank at opposite ends thereof, and an overflow for each of said alternate series of cells, in combination with electrodes for the cells and an electrical circuit including said electrodes.



405,604.

2. The herein-described electrolytical apparatus, consisting of a tank or casing composed of two heads, whereof one is provided with two feed-ports and the other with two exhaust and two overflow ports, arranged as set forth, a series of intermediate frames, each provided with diaphragms that divide the tank into a plurality of cells, each of said frames having four ports *m m' m'' m'''*, whereof ports *m''* and *m'''* register with said overflow-ports and communicate by ports *n'' n'''* with the interior of the cells, the two other ports *m m'* in the bottom of said frames registering with the feed and exhaust ports in the heads and communicating by ports *n n'* with the interior of said cells, said parts being detachably connected together, for the purpose set forth.

3. The herein-described electrolytical apparatus, consisting of a casing or tank composed of two heads, whereof one is provided with two feed-ports and the other with two exhaust and two overflow ports, arranged as described, a series of intermediate frames provided with porous diaphragms that divide the tank into plurality of cells, a feed and exhaust duct for each alternate series of cells, in communication therewith and with the corresponding ports in the heads of the tank, and an overflow duct for each of said alternate series of cells communicating with the overflow-ports in one of the heads, in combination with electrodes, supporting-rods for the same, provided with conducting-strips *e*[a], electrical conductors, to which the alternate ends of the strips are connected, and an electric circuit including said electrical conductors, for the purpose specified.

405,605. METALLIC ROOFING-CLEAT. LOUDLEY L. SAGENDORPH, Cincinnati, Ohio, assignor of one-half to Charles N. Harder, Fhilmont, N. Y. Filed Mar. 25, 1889. Serial No. 304,707. (No model.)

Claim.—1. A metallic roofing-cleat consisting of a body portion A and tongues B and B', the latter extending out from opposite sides of said body portion and in different planes, substantially as shown and set forth.

2. A metallic roofing-cleat having a body portion A, doubled on itself, and tongues B and B', extending out from opposite sides of said body portion and in different planes, substantially as set forth.

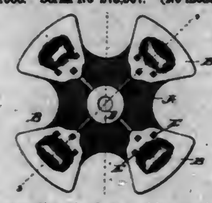
3. In combination with the roofing-plates having the standing flange *d* and overlapping flange *d'*, a cleat having a body portion A and tongues B and B', said body portion of the cleat resting over the flange *d*, and flange *d'* overlapping the body portion of the cleat, the tongue B overlapping and engaging the flange *d'* in a horizontal plane differing from tongue B', substantially as set forth.

405,606. TYPE-WRITING MACHINE. CHARLES E. SARGENT, Utica, N. Y. Filed Mar. 26, 1886. Serial No. 196,720. (No model.)

Claim.—1. In a type-writing machine having a carriage and a platen, the combination, with the platen, of the gravity pivoted paper-holding device pivoted in the carriage back of the platen substantially

405,606.

on the same horizontal plane, the lower portion of the paper-holding device falling under the platen, the rear of the paper-holding device forming an extended lever-plate, whereby its lower edge is always held by gravity under uniform pressure against the paper between it and the platen, substantially as set forth, for the purposes stated.



2. The combination, with the platen, of the independently-adjustable stops mounted in front thereof, each stop having a curved end underneath the platen, and the tilting pivoted gravity paper-holding device pivoted back of the platen, the lower edge thereof resting below the platen, substantially as set forth.

3. The combination of the independently-adjustable stops mounted in front of the platen, each stop having a downward-projecting lug, with the pivoted stop for engaging the lug, substantially as set forth, whereby the travel of the carriage may be limited.

4. The combination, with the adjustable stops mounted in front of the platen, each stop having a downward projection, of the slotted pivoted stop pivoted to the frame, with means, substantially as described, for limiting its movement, whereby the travel of the carriage is limited, substantially as set forth.

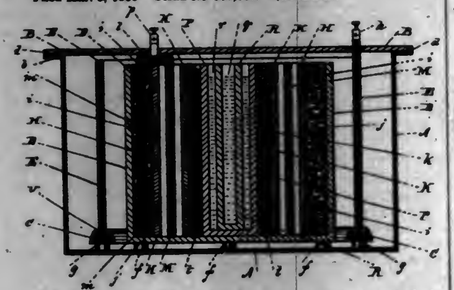
5. The combination, with the carriage, of the adjustable stops having projections, the pivoted stop pivoted to the frame to engage the projections, the extension-arm carrying a pivoted cam, the pivoted bell-arm for engaging the cam, and the bell, arranged substantially as set forth, for the purposes stated.

405,607. SPROCKET-WHEEL. WILLIAM E. SELLECK, Chicago, Ill. Filed May 9, 1888. Serial No. 273,367. (No model.)

Claim.—In a sprocket-wheel, the spider provided with strengthening-ribs on the legs thereof, constituting shoulders, in combination with sprockets, also provided with shoulders bearing against the ends of said legs, the ends of said sprockets bearing against the shoulders of the strengthening-ribs, and bolts intermediate said shoulders for detachably securing the sprockets to the spider, substantially as described.

405,608. CONVEYER. WILLIAM J. SELLECK, Riverside, Conn., assignor to Hamilton Borden and William E. Selleck, Chicago, Ill. Filed Apr. 28, 1888. Serial No. 272,106. (No model.)

Claim.—1. In a conveyer, the combination of a trough, the carrier-plates, the supporting-links thereof, a series of main links, and a series of connecting-links embracing the main links, the inner longitudinal diameter of said connecting-links corresponding substantially with the diameters of the two opposing end bars of the main links confined therein, substantially as described.



2. In a conveyer, the combination of a trough, the carrier-plates, the supporting-links thereof, the main links, and a series of connecting-links uniting said main links and supporting-links and having an inner diameter corresponding with the diameters of the end bars of the two opposing main links working therein, the sides of said main links and connecting-links being respectively arranged parallel and at a right angle to the sides of the carrier-plates, substantially as described.

3. In a conveyer, the combination of the carrier-plates, the sup-

porting-links thereof, the main links, and a series of connecting-links, the inner longitudinal diameter of which corresponds with the diameters of the two opposing end bars of the main links and the transverse diameter of said connecting-links with the diameter of one of said end end bars, substantially as described.

4. In a conveyer, the combination of a conveyer-trough the bottom of which is V-shaped in cross-section, a series of hexagonal-shaped carrier-plates, the supporting-links thereof, a series of main links and a series of connecting-links, the longitudinal and transverse diameters of which latter correspond, respectively, with the diameters of the two opposing end bars of the main links and the diameter of one of said bars, substantially as described.

405,609. GALVANIC BATTERY. JAMES SERSON, Boston, Mass., assignor to the Potter-Compton Electric Company, New York, N. Y. Filed Mar. 5, 1889. Serial No. 301,847. (No model.)

Claim.—1. In an electric battery of the character described, the combination of a containing-jar, a porous cup supported on legs within said jar, two detachable foraminous cylinders within said cup, and a porous jar within said cylinders, substantially as and for the purpose set forth.

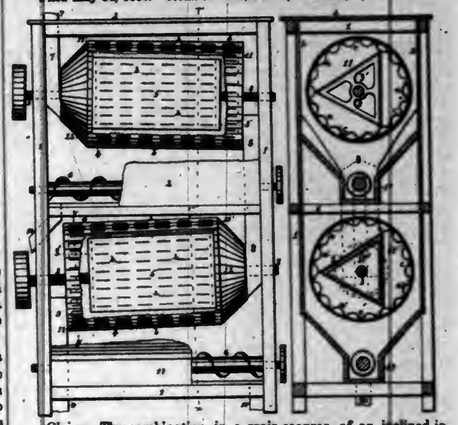
2. In an electric battery, the combination of a containing-jar, a porous cup supported on legs within said jar, a gutter for the zinc pole disposed on legs around said cup, two foraminous cylinders within said cup, a porous cup within the inner cylinder, and a porous cup within said inner cup, all being arranged to operate substantially as described.

3. In an electric battery, the combination of a containing-jar provided with a cover, a porous cup in said jar provided with legs, a gutter surrounding said jar and containing mercury, said gutter having legs, a zinc cylinder in said gutter, an acid solution for said zinc, a perforated cylinder in said cup, broken carbon between said cup and cylinder, a perforated cylinder within said first cylinder, a carbon plate between said perforated cylinders, a porous cup within the inner cylinder surrounded with bichromate of potash and containing sulphuric acid, and a porous cup immersed in said acid and containing nitric acid, substantially as and for the purpose set forth.

4. In an electric battery, the combination of a containing-jar, a porous cup supported on legs within said jar, two perforated cylinders within said cup, and a carbon plate between said cylinders, substantially as described.

5. In an electric battery, the combination of a containing-jar, a porous cup supported on legs within said jar, two perforated cylinders within said cup, an inner porous cup within the inner cylinder, and an innermost porous cup within the inner porous cup.

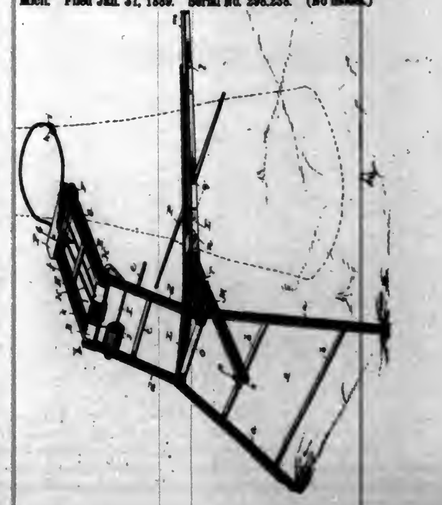
6. In an electric battery, the combination of a containing-jar, a porous cup therein, two perforated cylinders, one within the other and both within said cup, a carbon plate between said perforated cylinders, broken carbon between the outer perforated cylinder and said cup, and arms extending from the carbon plate into the space between the outer perforated cylinder and porous cup and connecting the carbon plate with the broken carbon.



7. In an electric battery, the combination of the jar A, having the cover B, the porous cup D, provided with legs *f*, the gutter C, having legs *g*, and disposed around said cup, the zinc cylinder E in said gutter, the perforated cylinders H K, disposed within said cup, the carbon plate M between said cylinders, provided with an arm extending laterally from the plate and downwardly into the space between the outer perforated cylinder and said porous cup D, the porous cup P within the cylinder K, and the porous cup R within the cup P, substantially as described.

8. In an electric battery, the combination of the jar A, provided with the cover B, the porous cup D, having legs *f*, the gutter C, containing free mercury and having legs *g*, the zinc M in said mercury, an acid solution for said zinc, the cylinders H K in said cup, the carbon plate M between said cylinders, and having an arm extending laterally from said carbon plate and downwardly into the space between the outer perforated cylinder and said porous cup D, broken carbon in said space, the porous cup P, containing sulphuric acid and surrounded by bichromate of potash, and the porous cup R, containing nitric acid, substantially as described.

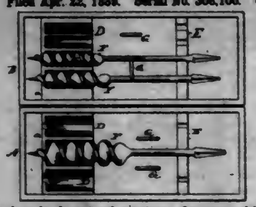
405,610. PROCESS OF CLEANSING RAW SUGAR, &c. ADOLF SEYFERTH, Auerbach, Hesse, Germany, assignor to Louis Engelbert, New York, N. Y. Filed May 4, 1889. Serial No. 309,589. (No specimens.)



Claim.—The improvement in cleansing raw crystals herein described, which consists in supplying them with sufficient water to form a concentrated solution of the impurities present and in washing away the dissolved impurities by forcing through the resulting magma a washing-fluid—such as paraffine-oil—which is not capable of dissolving the crystals, and is not soluble in water nor in the mother-liquor in which the crystals were formed.

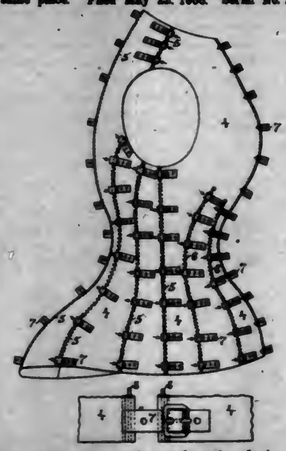
405,611. GRAIN-SCOURER. SILAS S. SHAVER, Clintonville, Wis. Filed May 31, 1887. Serial No. 239,909. (No model.)

Claim.—The combination, in a grain-scourer, of an inclined inwardly-punched cylindrical screen, the inner surface of the screen being composed of elevated and depressed portions arranged alternately and longitudinally with the screen, whereby grain will be carried partially around the screen, feed-openings in the highest end of the screen, discharge-openings in the lowest end of the screen, and a triangular outwardly-punched screen within and shorter than said cylindrical screen, one end thereof attached to the end plate of the cylindrical screen at its highest end, the other supported upon the shaft aforesaid independently of the lowest end of the cylindrical screen, substantially as described.



405,612. CORN-SHOCK BINDER. MOSE SPARLOCK, Orleans, Mich. Filed Jan. 31, 1889. Serial No. 298,238. (No model.)

Claim.—1. The combination, with the support A, of the pivoted arms *d*, the pivoted arms E, carried thereby, the arms L, pivoted to the support A, the pole *m*, pivoted to the arms L, and the removable bar P, substantially as and for the purpose specified.



2. The combination, with the support A, of the pivoted arms *d*, the pivoted arms E, carried thereby, the arms L, pivoted to the support A, the pole *m*, pivoted to the arms L, the compressing mechanism, and the brace-arm M, pivoted at one end to said arms L and at the other end detachably engaging the cross-bar of the support, substantially as described.

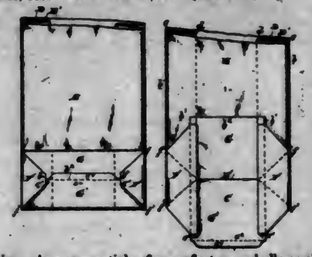
405,613. PACKAGE FOR AUGER-BITS. NORMAN SPERRY, Seymour, Conn. Filed Apr. 22, 1889. Serial No. 308,100. (No model.)

Claim.—The herein-described package for auger-bits, consisting of a box provided with a grooved rack adapted to receive the twist ends, with a support for the shank ends of the bits, the said grooves for the twist of the bits constructed with an inwardly-projecting flange at their outer ends, with which the lips of the bits may engage, and a clamp to hold the bits in place, substantially as described.

405,614. GARMENT-MEASURING DEVICE AND CUTTING-GUIDE. ELVIRA STEARNS, Providence, R. I., assignor of one-half to Elizabeth A. Sayles, same place. Filed May 22, 1888. Serial No. 274,698. (No model.)

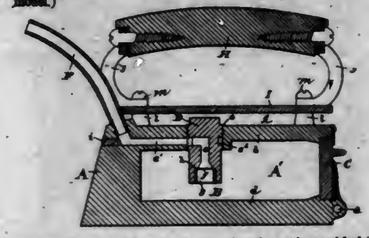
Claim.—A garment measuring and cutting device consisting of sections of inelastic material, the edges of each section strengthened by flexible wires secured to the edges of the inelastic material, and provided with adjusting-straps constructed to form an accurately-fitting garment when secured, and accurate patterns and guides for cutting the material when the sections are separated, as described.

405,615. APPARATUS FOR FEEDING BOILERS OR WATER-TANKS. JOEL W. STEVENS, Chicago, Ill., assignor to himself and Robert Bruce, same place. Filed Jan. 2, 1889. Serial No. 295,244. (No model.)



Claim.—1. The combination, with a water-receiving vessel and a supply-pump connected therewith, of a valve-section located in the steam-supply pipe of the pump, normally held open by the steam-pressure and adapted to be automatically closed by the back-pressure from the water-supply pipe of the tank to cut off the steam supply, substantially as described.

2. The combination, with a steam-pump, a water-receiving vessel connected therewith, and a pipe for supplying steam to the pump, of a valve-section located in the steam-supply pipe of the pump and provided with an opening *e*, the plunger *g*, located beneath said opening and carrying a valve *f*, and the back-pressure pipe *j*, substantially as described.



3. The combination of a steam-pump, a boiler, a water-receiving vessel, a pipe for supplying steam to the pump, pipes for conveying water from the pump to the water-receiving vessel and boiler, a valve-section located in the steam-supply pipe of the pump, a back-pressure pipe leading to said valve-section, and a valve normally held open by steam-pressure and automatically closed by the back-pressure of water, substantially as described.

405,616. PAPER BAG. CHARLES B. STILWELL, Philadelphia, Pa., assignor to the Union Paper Bag Machine Company, same place. Filed Jan. 21, 1889. Serial No. 297,063. (No model.)

Claim.—As a new article of manufacture, a bellows-sided satchel-bottomed paper bag having its bottom formed with side folds substantially equal in breadth to one-half the breadth of its tucked-in sides, its final folds formed with parallel-sided flaps of such a breadth that they will overlap the said folds sufficiently to form a strong pasted seam therewith, and a prolongation of one of the flaps sufficient in length to overlap and form a pasted seam with the other flap.

405,617. SAD-IRON. CHARLES A. STOCKWELL and WILLIAM D. ROSSE, Baltimore, Md. Filed Sept. 12, 1888. Serial No. 285,173. (No model.)

Claim.—1. A sad-iron having a chamber A', provided in the top with an opening *c*, and a screw-plug D, closing the opening, and a burner in the chamber having a perforated or wire-gauze disk *f*, confined by a mouth-ring *g*, as set forth.

2. A sad-iron having a chamber A', provided in the top with an opening *c*, and a screw-plug D and a duct *c'* in the iron-body closed by a plug *i*, and a burner within the chamber having a duct with a right-angled bend which connects with the said duct in the iron-body, as described.

3. A sad-iron having a chamber A', provided with a top opening *c*, and a duct *c'* in the iron-body closed by a plug *i*, and a screw-plug D, closing the top opening *c* and having attached a burner whose supply-duct *e* is in communication with the said duct in the iron-body, substantially as described.

4. A sad-iron having a chamber A', provided with a top opening *c* and a duct in the iron-body, and a screw supply-plug D, for closing said opening, and having an exterior annular groove *c²*, and a burner whose supply-duct *e* opens at said annular groove.

405,618. DIE FOR SHAPING SHEET METAL. ORRIN W. SWIFT, New Haven, Conn. Filed Sept. 24, 1888. Serial No. 286,172. (No model.)

Claim.—The herein-described dies for the manufacture of articles from burnished sheet metal, consisting in a pair of dies presenting faces of reverse shape corresponding to the two sides of the article to be produced, the surface corresponding to the burnished surface of

405,618.

the article to be produced being covered with soft non-metallic material, the said non-metallic material being secured directly to the said surface by suitable adhesive material, substantially as described.

405,619. **WOOL-WASHING MACHINE.** STEPHEN C. TAFT, Franklin, Mass., assignor of one-half to Joseph R. Clark, same place. Filed Jan. 17, 1889. Serial No. 296,633. (No model.)

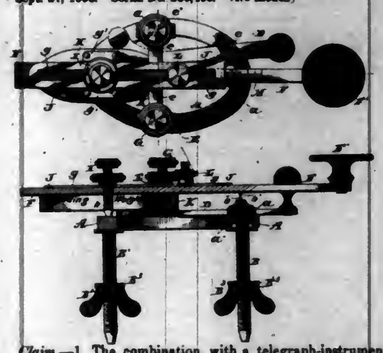
Claim.—1. In a wool-washing machine, the combination of a tank having perforated ends, a heavy roller extending transversely across the same from side to side, mechanism for reciprocating the roller to cause it to travel backward and forward over the wool at the bottom of the tank, and a device for ejecting or spraying water onto the wool while being washed by the action of the roller, all operating substantially in the manner and for the purpose described.

2. In a wool-washing machine, the combination of the tank A, provided with a lining *b*, having its ends *c* curved in the arc of a circle and provided with perforations *f*, as described, the chambers *d*, between the said ends *c* and the ends of the outer casing of the tank, provided with means for discharging water therefrom, and a reciprocating roller B, extending transversely across the tank from one side to the other and adapted to alternately pass over the wool and forcibly expel the water squeezed therefrom through the perforated ends *c* of the tank into the chambers *d*, all constructed and arranged to operate substantially in the manner and for the purpose set forth.

405,620. **HOT-AIR REGISTER.** HORACE K. TALLMADGE, Buffalo, N. Y. Filed Mar. 28, 1889. Serial No. 305,051. (No model.)

Claim.—1. In a hot-air register, the combination, with the register-box and a damper arranged in the lower portion thereof, of a removable top plate arranged at the upper end of the register-box and carrying the damper and its supports, substantially as set forth.

2. In a hot-air register, the combination, with the register-box and a damper arranged in the lower portion of said box, of a removable top plate arranged at the upper end of the register-box and supporting-arms depending from the top plate and carrying the damper, substantially as set forth.



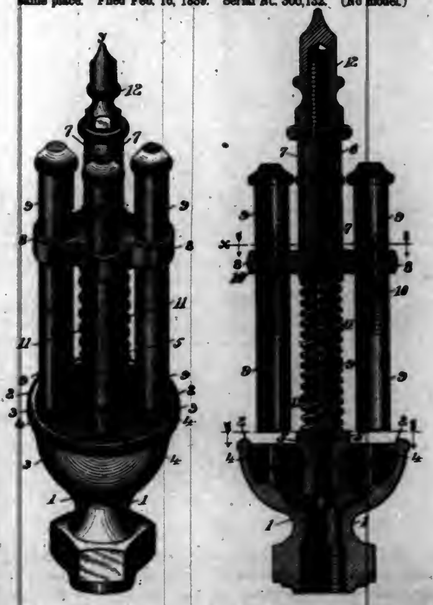
3. In a hot-air register, the combination, with the register-box and a damper arranged in the lower portion of said box, of a removable top plate arranged at the upper end of the register-box, supporting-arms depending from the top plate and carrying the damper, and stops or shoulders arranged on said arms, whereby the tilting movement of the damper is limited, substantially as set forth.

4. In a hot-air register, the combination, with the register-box and a damper arranged in the lower portion of said box, of a removable top plate arranged at the upper end of the register-box, supporting-arms depending from the top plate and carrying the damper, a shifting button or knob arranged on the top plate, and a rod connecting the damper with said shifting button, substantially as set forth.

5. In a hot-air register, the combination, with the register-box, of a top plate arranged at the upper end of said box, a pivoted damper arranged in the lower portion of the register-box, a shifting button sliding in a way in the top plate and provided with friction-springs, and a rod connecting said button with the damper, substantially as set forth.

6. In a hot-air register, the combination, with the register-box having an opening in its bottom, of a recessed collar fitted in said opening, a top plate arranged at the upper end of said box and having depending supporting-arms fitting in the recesses of said collar, and a damper pivoted between said arms, substantially as set forth.

405,621. **KEY.** CLARENCE W. TAYLOR, Janesville, Wis. Filed Sept. 27, 1888. Serial No. 286,488. (No model.)

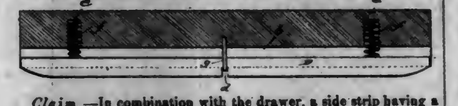


Claim.—1. The combination, with a telegraph-instrument, of a vibrating lever mounted therein, a sliding plate having a longitudinal slot carried on the lever, a weight suspended from the sliding plate and provided with a longitudinal slot, and a set-screw adapted to pass through the slot in the sliding plate and into the lever to retain said plate at any desired adjustment, substantially as set forth.

2. The combination, with a telegraph-instrument, of a vibrating lever mounted therein, a sliding plate carried on said lever, a scale on the lever with which the plate is adapted to register, a weight suspended from the sliding plate, and a set-screw for retaining said sliding plate at any desired adjustment, substantially as set forth.

3. The combination, with a telegraph-instrument, of a vibrating lever having torsional trunnions mounted on the posts of said instrument, a bar fixed to each of said posts and extending inwardly beneath the trunnions, and loops carried by the trunnions and encircling the fixed bars, substantially as set forth.

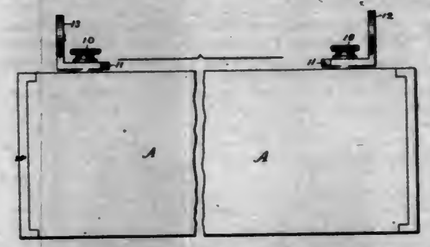
405,622. **STEAM-WHISTLE.** EDWIN R. TOMLINSON, Bridgeport, Conn., assignor of one-half to the Eaton, Cole & Burnham Company, same place. Filed Feb. 16, 1889. Serial No. 300,132. (No model.)



Claim.—1. The combination, with the steam-bowl, the same having in its upper surface a plurality of annular steamways leading outward from said bowl, of the squared vertical stem, the bracket arranged upon said squared portion, the tubes secured in said brackets, one over each steamway, and means, as described, for raising and lowering the bracket and tubes, substantially as set forth.

2. The combination, with the steam-bowl, of the pierced cover at the top thereof, the plugs arranged within said bowl and projecting upward through said holes, whereby annular steam-exits are afforded, the central stem mounted upon said bowl, and the plurality of tubes mounted on said stem and arranged one over each of the annular steam-exits, substantially as set forth.

3. The combination, with the bowl having the plurality of annular steam-exits in the upper face thereof, of the outwardly-projecting stem, squared for a portion of its length, the bracket mounted upon said squared portion, the resonant tubes secured in said bracket, one above each steam-exit, the spring coiled about the stem and pressing upward against the bracket, and the nut screw-threaded upon the top of the stem and adapted to control the position of the bracket, substantially as specified.



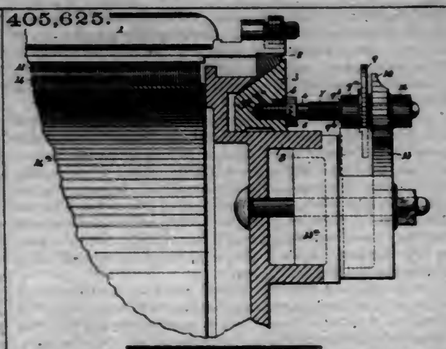
4. The combination, with the bowl having the steam-exits formed therein, of the stem, the plurality of tubes arranged about said stem, each tube interiorly screw-threaded and provided with a movable plug, whereby the tone of the tube may be varied, and the spring and nut for the elevation or depression of the tubes, substantially as set forth.

405,623. **SLIDE FOR DRESSING-CASES.** WILLIAM P. TRACY, Grand Rapids, Mich. Filed Oct. 2, 1888. Serial No. 286,975. (No model.)

Claim.—In combination with the drawer, a side strip having a plain groove, a plain notched bearing-strip therein, springs underneath said strip, and a staple or staples set in the side piece astride the bearing-strip at the notches, all substantially as described.

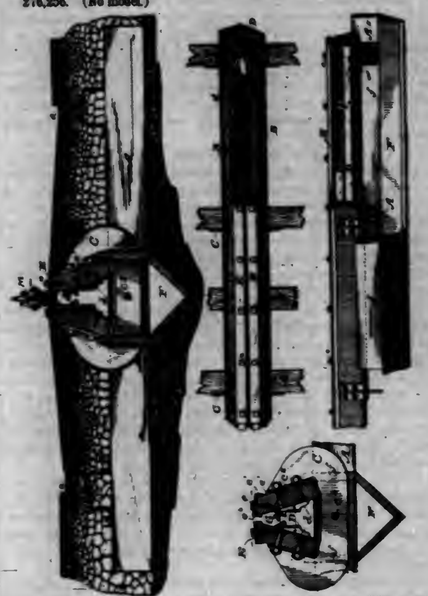
405,624. **SIGHTING ATTACHMENT FOR SPIRIT-LEVELS.** JUSTUS A. TRAUT, New Britain, Conn., assignor to the Stanley Rule and Level Company, same place. Filed Jan. 22, 1889. Serial No. 297,308. (No model.)

Claim.—1. The combination of a level stock or bar with the bases 6 6, adjustable with reference to a given surface of said stock or bar, the sights adapted to be seated upon the face of said bases, and devices for attaching said sights to and detaching them from said bases, substantially as described, and for the purpose specified.



2. The combination of a level stock or bar, the non-projecting bases 6 6, adjustable with reference to a given surface of said bar or stock and provided with a threaded hole, the holding-screws 10, and the sighting attachments having a projecting seat upon the under side of their base-plates for resting upon said bases 6 6, substantially as described, and for the purpose specified.

405,625. **DEVICE FOR ADJUSTING CARD-PLATE.** EDMUND TWEEDALE, Accrington, County of Lancaster, England, assignor to John Bullough, same place. Filed May 28, 1888. Serial No. 275,371. (No model.) Patented in England Sept. 28, 1885, No. 11,514.



Claim.—1. In combination with the card-flat, the flexible ring 2 and the cone 3, an operating-rod for said cone having a threaded end adapted to the threaded opening in the cone, the jam-nut 5 and locking-pin 6 for holding the rod against rotary movement, the bearing 13 for the rod, the movable dial having the nut 9*, and the nut 12, substantially as described.

2. In combination with the card-flat, flexible ring 2 and cone 3, the longitudinally-movable rod, said rod being threaded, the movable dial having the nut 9* on said rod, the bearing 13, and the nut 12, substantially as described.

405,625.

405,626. **SLOTTED CONDUIT FOR ELECTRICAL CONDUCTORS.** CHARLES J. VAN DEPOELE, Chicago, Ill. Filed June 6, 1888. Serial No. 276,256. (No model.)

Claim.—1. A conduit for electrical conductors, comprising an exterior casing having side walls of insulating material, yokes for supporting and sustaining said side walls, supports arranged within the conduit and attached to the insulating side walls, and conductors secured to said supports, substantially as described.

2. A conduit for electrical conductors, comprising side walls of wood, metallic yokes within which the side walls are secured, conductors mounted between said side walls, and metallic capping-plates resting upon the upper edges of the side walls, substantially as described.

3. A conduit for electrical conductors, comprising metallic yokes located between the rails of a railway-track and sustained upon the cross-ties thereof, said yokes being provided with interior flanges for attachment to the exterior of and constituting seats, and inclined lateral supports for the side walls of the conduit, and side walls secured within said yokes at an angle from the vertical.

4. A conduit for electrical conductors, comprising metallic yokes located between the rails of a railway-track and sustained upon the cross-ties thereof, and having interior flanges at an angle from the vertical, side walls arranged within said yokes and secured against the flanges thereof, and inclined toward each other at their upper edges and provided with metallic capping-plates along their upper edges, substantially as described.

5. The combination, in a conduit for electrical conductors, of one or more electrically-connected conductors secured to insulating-supports arranged within said conduit and representing one side of the

circuit, metallic capping-plates on the exterior edges of the side walls of said conduit and electrically connected to form the other side of the circuit, and a contact-truck comprising metallic wheels arranged to travel upon and in continuous contact with the capping-plates, and contact devices for continuous contact with the conductors within the conduit, substantially as described.

6. A conduit for electrical conductors, comprising side walls of insulating material, metallic yokes within which said sides are supported at the desired distance apart, metallic capping-plates secured upon the upper edges of the side walls and connected to form one side of the circuit, conductors mounted upon insulating-supports attached to the inner sides of the conduit and forming the other side of said circuit, and a contact-truck comprising supporting-wheels moving upon the exposed conductor, and an insulating contact device extending into the conduit and into contact with the interior conductors, substantially as described.

7. A contact device for electrical conduits, comprising one or more spring-actuated contacts engaging the conductors of one side of the circuit, an insulated connection and support extending therefrom and carrying wheels or contacts pivotally connected to the insulating-support and making contact with the other side of the circuit, substantially as described.

8. The combination, with a conduit for electrical conductors provided with main conductors of one polarity upon the interior thereof and conductors of opposite polarity upon the exterior thereof, of a contact device comprising a plurality of spring-supported contacts engaging the main conductors within the conduit, an insulated connection and support extending therefrom, and a carrying-wheel pivotally connected to each end of the insulating-support and making contact with the conductors upon the exterior of the conduit, substantially as described.

9. The combination, with a conduit for electrical conductors comprising a protective casing, insulated conductors of one polarity within the casing, metallic capping or surface-plates upon the exterior of the casing and connected to form the other side of the circuit, a contact device comprising a plurality of spring-supported contacts disposed between the main conductors, an insulated connection and support extending therefrom, and carrying-wheels pivotally connected to each end of the insulating-support and engaging the other side of the circuit, substantially as described.

10. A conduit for electrical conductors, comprising a protective casing, insulated conductors within the casing and representing one side of the circuit, protective metallic plates upon the exterior of the casing, said plates being connected to form the other side of the circuit, a contact device comprising a plurality of spring-actuated contacts engaging the conductors within the conduit, an insulated connection and support extending from said contact, and metallic carrying-wheels formed with a central rib or projection and pivotally connected to each end of the insulating-support and arranged to engage the exterior conductors, substantially as described.

11. The combination, with a contact-truck and a moving vehicle, of elastic draft connections extending between the truck and vehicle, an inelastic connection extending along said elastic connections and arranged to limit the expansion thereof under abnormal strain, and a detachable connection between said connections and the vehicle, substantially as described.

12. A contact-truck for electrical conduits, comprising a wheeled exterior support moving upon the surface of the conduit, insulated contact devices extending from the support into the conduit, and one or more rigid guides extending from the supports of the wheels and entering the slot in advance thereof, substantially as described.

13. A contact-truck for electrical conduits, comprising supporting-wheels moving upon the conduit, contact devices extending into the conduit, and an extension or extensions projecting into the slot in advance of the supporting-wheels for removing obstructions, substantially as described.

14. A conduit for electrical conductors, comprising walls of insulating material, conductors secured to said walls, and inwardly-extending and downwardly-inclined deflecting strips or boards above the conductors, substantially as described.

15. A conduit for electrical conductors, insulating-supports for the conductors therein, and inwardly-extending and downwardly-inclined drip-water deflecting boards or strips above the conductors, substantially as described.

405,627. SWITCH FOR SUSPENDED ELECTRIC CONDUCTORS.

CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Feb. 19, 1889. Serial No. 300,395. (No model.)

Claim.—1. A switch for electric conductors, comprising a rib or member for each conductor, the inner extremities of which are arranged to intersect or lap, and a bridge or body by which said members are connected, substantially as described.

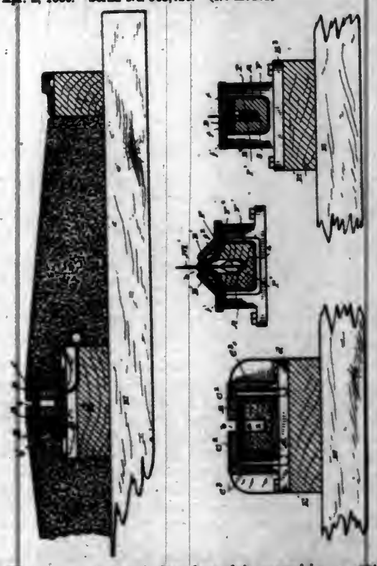
2. A switch for electric conductors, comprising a rib or member for each conductor, and a bridge or body formed integral with said ribs by which they are connected, substantially as described.

3. A switch for electric conductors, comprising a rib or member for each conductor, the inner extremities of the ribs being arranged to intersect or lap, substantially as described.

4. A switch for electric conductors, comprising a rib or member for each conductor, and a bridge or body by which said members are connected, the inner extremities of the several members being arranged to intersect or lap, substantially as described.

5. A switch for electric conductors, comprising a plurality of arms or members, to which the conductors are connected, the inner extremities of the members being arranged to intersect or lap, a block located at the point of intersection of the several members, and ways or channels between the intersecting members, substantially as described.

6. A switch or crossing for electric conductors, comprising arms or members the inner extremities of which are arranged to intersect or lap, said arms being connected to the crossing-conductors, a central block, and passages around the block and between the extremities of the conductors for the passage of the trolley-wheel in the desired direction, substantially as described.



7. A switch for suspended conductors, comprising a rib or member for each conductor, said members being supported and connected at their inner extremities and having said extremities arranged to lap or intersect, so that one flange of the trolly-wheel will engage the leaving rib before the other flange becomes disengaged from the entering rib, substantially as described.

8. A switch for suspended electric conductors, comprising a rib or member for each conductor, each member being formed with an opening or groove to receive the conductor and with a rib or part extending from the openings or grooves to carry the contact device to the point of divergence, substantially as described.

9. A switch for suspended electric conductors, comprising a rib or member for each conductor, each member being formed with an opening to receive the extremity of the conductor, and with a rib or part extending from the said openings, forming continuations of the conductor to carry the contact device to the point of divergence, substantially as described.

405,628. CLOSED SLOTTED CONDUIT FOR ELECTRIC RAILWAYS.

CHARLES J. VAN DEPOELE, Lynn, Mass. Original application filed Jan. 5, 1889, Serial No. 295,806. Divided and this application filed Apr. 2, 1889. Serial No. 305,722. (No model.)

Claim.—1. A closed slotted conduit comprising a protective casing, an insulating-lining therefor, an electric conductor supported within the lining, surface or capping plates forming a part of the conductor-support, flexible fibrous packing-strips adjacent to the edges of the protective casing, and springs behind the strips for holding them in contact to close the slot, substantially as described.

ing, metallic chairs for supporting the capping-plates, and continuous strips of insulating material between the capping-plates and the lining for insulating the said lining from the surface-plates and closing the conduit, substantially as described.

2. A closed slotted conduit for electric conductors, comprising an exterior metallic casing formed with a slot along its upper side, an interior insulating-support, a conductor attached to said interior support, and flexible insulating slot-closing strips interposed between the edges of the metallic casing and acting to close the conductor-containing chamber, substantially as described.

3. A closed slotted conduit comprising a slotted metallic tube or chamber extending along the line of way, an insulating-lining within said chamber, a main supply-conductor secured to and supported by the insulating-lining within the conduit, and flexible insulating-strips on the under side of each side of the slot, said strips being normally in contact and acting to close the slot against the entrance of water, substantially as described.

4. A closed conduit comprising a slotted metallic casing extending along the line of way, a slotted insulating-lining within said chamber, a main supply-conductor supported by said insulating-lining, flexible insulating-strips arranged on the under side of each side of the slot between the metallic casing and the interior insulation, the adjacent edges of said strips being normally in contact to close the same, and a traveling contact device engaging the conductor, and a thin plate or extension connected to the contact and extending upward between the edges of the slot-closing strips, substantially as described.

5. A conduit for electric conductors, comprising sections of metallic casing, a chair for supporting and uniting the same formed in part of greater internal diameter than the ends of the sections to be united, and a yielding water-proof packing filling the space between the interior of the chairs and the ends of the sections to be united, substantially as described.

6. A contact device for slotted conduits, provided with non-conducting slot-closing strips, comprising a plate extending through the slot-closing material and elongated at its lower portion, and formed with upwardly-inclined sloping edges for opening the slot with an upward movement, contact devices attached to the lower portion of and moving with said plate, and connections secured to the plate for propelling the said plate along the conduit, substantially as described.

7. A contact device for closed slotted conduits, comprising a protected conducting-plate extending through the slot of the conduit, connections secured to said plate for propelling the same along the conduit, contact devices attached to and moving with said plate and adapted to engage the conductor within the conduit, and a plow secured to the portion of the plate exterior to the conduit and moving upon the exterior thereof, substantially as described.

8. A contact device for closed slotted conduits, comprising a protected metallic plate, connections secured to said plate for propelling the same along the conduit, contact devices attached to and moving with said plate and adapted to engage the conductor within the conduit, and a plow insulated from and surrounding the portion of the conducting-plate exterior to the conduit and moving upon the exterior thereof, substantially as described.

9. A contact device for slotted conduits, provided with non-conducting slot-closing strips, comprising a protected metallic plate extending through the slot-closing material, a contact device attached to the plate for engaging the conductor within the conduit, and protective metallic plates pressing upwardly against the under sides of the opening into the conduit, substantially as described.

10. A contact device for electric conduits, comprising a protected metallic plate, rubbing-blocks attached to the lower extremity thereof and adapted to engage the conductor within the conduit, springs secured to the plate and pressing the blocks downwardly upon the conductor, protective metallic plates pressing upwardly against the under sides of the slot-closing devices, and a plow of insulating material attached to and surrounding the conducting-plate above the slot-closing devices, substantially as described.

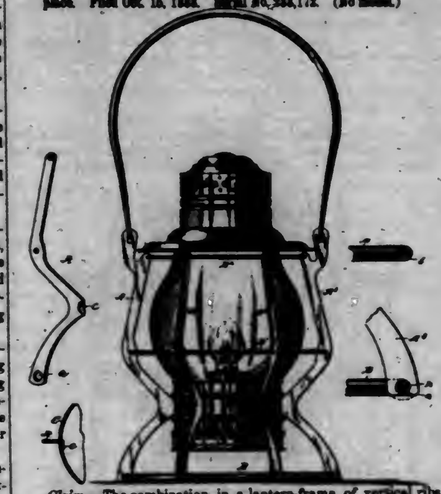
11. In a conduit for electric conductors, the combination, with a solid grooved insulating-support, of a conductor in said groove, said conductor formed of sections, and metallic couplings slipped upon and uniting the ends of the sections, substantially as described.

12. A contact device for closed slotted conduits, comprising contacts adapted to engage the conductor or conductors within the conduits, an extension therefrom consisting of a mechanically and electrically protected conductor adapted to be moved between and to support the slot-closing material, substantially as described.

13. A closed slotted conduit comprising a protective casing formed with a slot along its upper side, an interior insulating conductor-support, flexible non-conducting slot-closing strips adjacent to the edges of the protective casing, and springs behind the strips for holding them in contact to close the slot, substantially as described.

14. A closed slotted conduit comprising a protective casing formed with a slot along its upper side, an interior insulating conductor-support, flexible fibrous packing-strips adjacent to the edges of the protective casing, and springs behind the strips for holding them in contact to close the slot, substantially as described.

15. A closed slotted conduit comprising an exterior protective casing, a flexible insulating-lining within the casing, a conductor or conductors inclosed within the lining, and flexible cushions behind the upper edges of the lining for holding the same in contact, substantially as described.

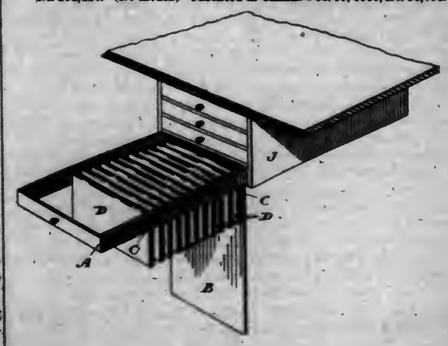


16. A protective casing for slotted conduits, comprising a sheet-metal body or trough, metallic chairs for removably sustaining the body of the conduit, and capping-plates securing the trough in position, said capping-plates being sustained and secured upon the chairs and extending over the said body or trough, substantially as described.

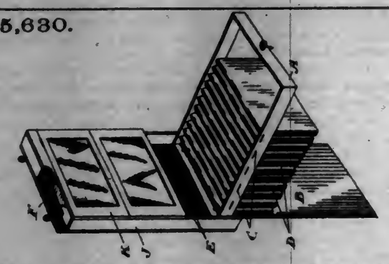
17. A protective casing for slotted conduits, comprising a sheet-metal body or trough formed with lateral flanges, metallic chairs for receiving the body of the conduit, and upon the upper extremities of the arms of which the said flanges rest, and capping-plates resting upon the flanges of the body of the conduit and secured to the chairs, substantially as described.

18. The combination, with the conduit of the class described, of the rail-supporting cross-ties, a continuous longitudinal support also upon said cross-ties, chairs attached to said support at suitable intervals, and the conduit sustained within the chairs, substantially as described.

405,629. LANTERN-FRAME.



ISAAC VAN HAGEN, Chicago, Ill., assignor, by mesne assignments, to James H. Raymond, trustee, same place. Filed Oct. 15, 1888. Serial No. 288,172. (No model.)

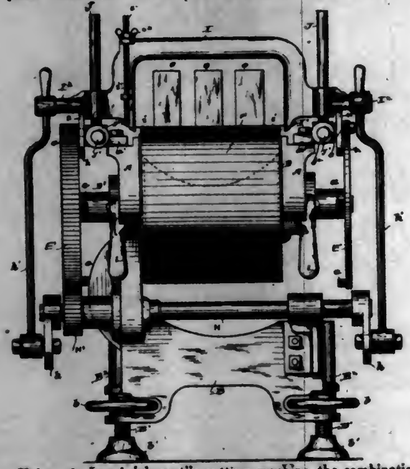


Claim.—The combination, in a lantern-frame, of vertical ribs of rectangular cross-section, horizontal ribs passing through the vertical ribs, an oil-pot holder having slots corresponding to the vertical ribs, and lugs bent at right angles to the body of said ribs and adapted to enter said slots, as described.

405,630. CASE FOR DISPLAYING SHEETS OF PAPER.

MAURICE M. VARDON, Toronto, Ontario, Canada. Filed Jan. 30, 1889. Serial No. 298,127. (No model.) Patented in Canada Feb. 15, 1889, No. 30,706.

405,630.



Claim.—1. A frame A, having a series of wires C strung across it to form supports for sheets of paper D, and a back B, hinged to the frame A at one end thereof, in combination with a case J, designed to receive the frame and its contents, substantially as and for the purpose specified.

2. A horizontal frame A, having a series of wires strung across it, each wire being slightly below the other, commencing at the farthest wire from the hinge, in combination with a case J, designed to receive the frame A, substantially as and for the purpose specified.

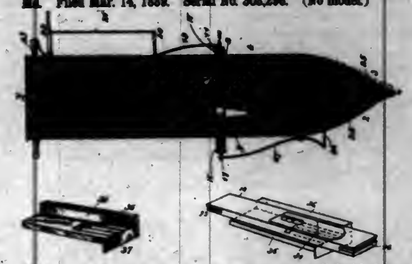
3. A frame A, having a series of wires strung across it, each wire being slightly below the other, commencing at the farthest wire from the hinge, in combination with a back B, hinged to the frame A, and the case J, designed to receive the frame A, and back B, substantially as and for the purpose specified.

4. A frame A, having a series of wires C strung across it designed to support the sheets of paper D, combined with cords E, attached at one end to said frame, the spring-roller F, having one end of said cords attached thereto, and the case J, substantially as and for the purpose specified.

405,631. BRICK OR TILE CUT-OFF MACHINE. WILLIAM W. WALLACE, Willoughby, Ohio, assignor to J. W. Penfield & Son, same place. Filed Sept. 27, 1888. Serial No. 286,501. (No model.)

Claim.—1. In a brick or tile cutting machine, the combination, with horizontally-moving carrier, of cutter reciprocating on vertical ways, such ways being mounted on horizontally-sliding bars, mechanism, substantially as indicated, for automatically actuating the cutter by the movement of the said carrier, substantially as set forth.

2. The combination, with horizontally-moving carrier, of cutter reciprocating on vertical ways, said ways being mounted on sliding bars, the latter operating in a plane parallel to the movement of the carrier, mechanism, substantially as indicated, for operating the cutter and intermittently moving the cutter in unison with the carrier, substantially as set forth.

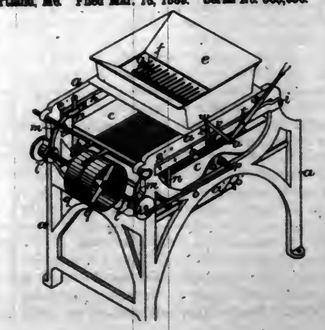


3. The combination, with endless apron and drums for supporting the same, of supporting-frame on which the journal-boxes of the said drums are supported, the said frames being open on the one side, substantially as indicated, whereby the endless apron may be removed from the table intact, substantially as set forth.

405,632. NUT-LOCK. CHARLES H. WARREN, Peterborough, N. H. Filed June 23, 1888. Serial No. 277,955. (No model.)

Claim.—A nut-lock consisting of a washer having portions of the metal surrounding the bolt-opening struck up to form opposed inward-projecting serrated tongues for engaging the threads of the bolt, and having its periphery provided with outward-projecting flexible arms adapted to be turned into engagement with the outer edges of the nut and to extend across the same, substantially as specified.

405,633. HAND-PLANTER. CHARLES G. WATSON, Piney Grove, Md. Filed Mar. 14, 1889. Serial No. 303,296. (No model.)



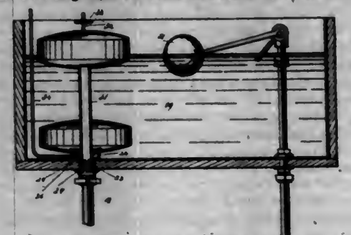
Claim.—1. In a hand corn-planter, a case or shell divided into longitudinal apartments and having a common bottom provided with independent vertical openings or passages, in combination with two slides connected together for simultaneous operation, a hand-lever connected to the slides at one end thereof, a lever arranged within the lower part of the shell or case, below the bottom thereof, and arranged to impinge against a movable spring side of said case, and connections between the opposite end of the slides and the lever, substantially as and for the purpose described.

2. In a hand corn-planter, the combination of a case divided into longitudinal apartments and having a fixed bottom which is provided with vertical passages intersected by horizontal passages, the independent slides fitted in said horizontal passages, the transverse plates detachably connected to the ends of said slides, a hand-lever connected to the slides at one end, a lever arranged within the case, below the bottom thereof, and adapted to impinge against a movable side at the extreme lower end of the case, and connections between said lever and the free end of the slide, all combined and arranged substantially as and for the purpose described.

3. In a hand corn-planter, the combination of a case or shell having the sides or walls thereof converging at its lower extremity and one of said sides of spring metal, in combination with a fixed bottom above the tapered extremity of the case, a reciprocating slide supported by said bottom, a lever carrying a friction-roller which rides against the spring side or wall of the shell, and connections intermediate of the slide and lever, substantially as and for the purpose described.

4. In a hand corn-planter, the combination, with a case or shell having a bottom provided with a transverse passage, of a slotted slide 35, provided at one side of its slot with a raised longitudinal rib, another slide fitted on the slide 35 and detachably secured thereto, and mechanism for reciprocating the slides, substantially as and for the purpose described.

405,634. CORN AND SILK SEPARATOR. JOHN I. WESLEY, Portland, Me. Filed Mar. 18, 1889. Serial No. 303,656. (No model.)



Claim.—1. In a corn and silk separator having a suitable supporting-frame, the combination, with a sieve-pan attached to said frame by pivoted hangers, a power-shaft having band-wheel and crank-disks on its ends, and crank-shaft connecting said pan with said disks, of jolting-bars pivoted to the frame, combs journaled in the jolting-bars, and a hopper, substantially as and for the purposes set forth.

2. In a corn and silk separator having a suitable supporting-frame, the combination, with a sieve-pan attached to the frame by pivoted hangers, a power-shaft with band-wheel and crank-disks, and shaft connecting said disks and said pan, of jolting-bars pivoted to the frame, combs journaled in the jolting-bars over the pan, a hopper, projections on the hangers, and downwardly-curved plates attached to the jolting-bars, substantially as set forth.

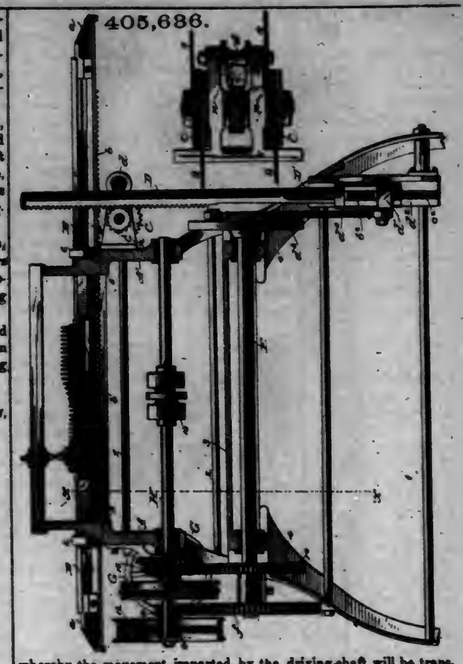
3. In a corn and silk separator having a suitable supporting-frame, the combination, with a swinging sieve-pan, as described, jolting-bars pivoted to the frame, combs journaled in the jolting-bars, and a hopper, of levers rigidly attached to the comb-journals, a link connecting the ends of said levers for dumping the combs, as set forth.

4. In combination, a swinging sieve, combs located above said sieve for collecting the silk and capable of being dumped, mechanism for imparting a jolting motion to said combs, and levers for operating the combs to clear the teeth of the accumulated silk, as set forth.

405,635. WATER-CLOSET. ROWLAND WESTON, East Saginaw, Mich. Filed Aug. 18, 1888. Serial No. 283,060. (No model.)

Claim.—1. The combination, with the bowl having a valve normally closing its outlet, of a stand-pipe communicating with the bowl below the water-level and normally filled with water, a tank from which the upper end of the stand-pipe leads, and a float-valve in the tank completely closing the upper end of the stand-pipe against air or water, whereby said valve will be held closed by the suction exerted by the column of water in the stand-pipe, released when the bowl is emptied to again fill the stand-pipe, and be closed by its weight when the water in the tank is insufficient to float it, substantially as set forth.

2. The combination, with the water-closet bowl having a trap-valve normally closing its outlet to hold the water in the bowl and an aperture below the water-line, of a normally-filled stand-pipe communicating with the bowl through said aperture, a tank with the bottom of which the upper end of the stand-pipe communicates, a float-valve normally closing the said upper end of the pipe against the entrance of either air or water and held in its closed position against its tendency to rise by the suction caused by the weight of the water in the stand-pipe, and a supply-pipe leading into the tank and having a float to close it when the water reaches its proper level, the said float-valve being released by the exit of the water from the bowl, floating or held buoyant until the tank has sufficiently discharged, and then closing by its weight to be again held closed by the action of the water in the stand-pipe, substantially as set forth.



3. In a water-closet, the combination, with a bowl, a vertical extension produced upon the rear of the same, forming a flushing-chamber provided with an outlet at the bottom leading into the bowl, a tank, and a pipe connecting the tank and flushing-chamber, of two connected spaced floats in said tank, a guide attached to the upper float, and a valve secured to the under side of the lower float adapted to close the flushing-tube, substantially as shown and described.

4. In a water-closet, the combination, with a bowl, a vertical extension produced upon the rear of the same, forming a flushing-chamber provided with an outlet in the bottom leading into the bowl, a tank, and a pipe connecting the tank and flushing-chamber, of a cup-shaped valve-seat above the flushing-tube, two spaced connecting-floats, a guide attached to the upper float, a valve secured to the bottom of the lower float, consisting of disks of different diameters, and a central slotted tube adapted to enter the flushing-pipe, substantially as shown and described.

405,636. STRAIGHT-KNITTING MACHINE. FRANK WILCOMB, Providence, R. I., assignor to the Wilcomb Manufacturing Company, San Francisco, Cal. Filed Feb. 29, 1888. Serial No. 265,734. (No model.)

Brief.—The object of the invention is to provide improved means

405,636.

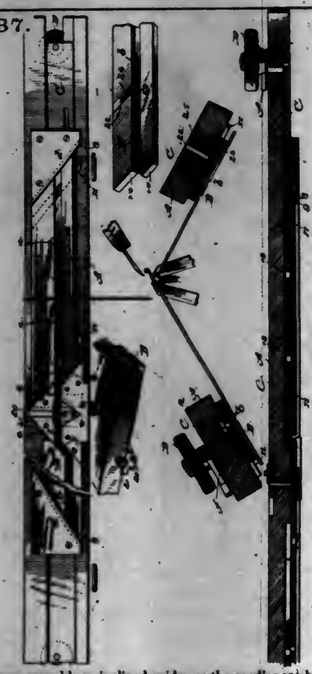
whereby the movement imparted by the driving-shaft will be transmitted easily to the slide-bars, and whereby ready access may be had to the operating parts of the machine, and compactness of form is secured.

Claim.—1. In combination, the slide-bars, the horizontal rack-bars, the vertical rack-bars, gear-and-pinion connections to the horizontal rack-bars which move the slide-bars, a cross-head provided with pinions, stationary racks, and guideways, the pinions being in mesh with the vertical rack-bars and stationary racks, a driving-wheel, and a pitman connecting the cross-head to the driving-wheel, all substantially as described.

2. In combination, the slide-bars, a shaft disposed transversely with relation to said slide-bars and having driving connections therewith, a reciprocating operating-bar arranged to move across the plane of the slide-bars and having operating-connections with said transverse shaft, the driving-shaft, and connections whereby said bar is reciprocated from said driving-shaft.

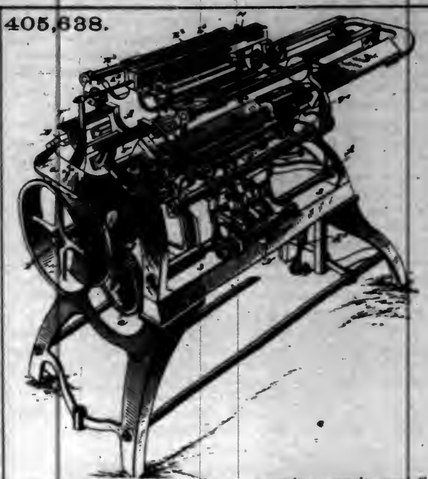
3. In combination, the slide-bars, the vertical reciprocating operating-bar therefor, intermediate connections between the same, the cross-head, and an accelerating connection between the vertical operating-bar and the cross-head for reciprocating the said bar, and means for operating the cross-head, substantially as described.

4. In combination, the slide-bars, the reciprocating operating-bar, connections between the slide-bars and operating-bar, said operating-bar having rack-teeth on its lower end, the cross-head having a channel to receive the end of the reciprocating bar, means for reciprocating the cross-head, a pinion carried by the cross-head and meshing with teeth on the operating-bar, and the rack-teeth on the guide-way, also engaging with the pinion, substantially as described.



5. In a knitting-machine and in combination, the slide-bars, the driving-shaft, and connections from said shaft to the bars for operating them, the cam-shaft of the machine, the pulley 12 and pinion *e*, the gear *f*, and the gears 14 15, for imparting the movement from the driving-shaft to the cam-shaft, substantially as described.

6. In combination, the slide-bars, the driving-shaft having the large gear thereon, the pinion meshing with said gear for driving it, a reciprocating operating-bar with connections to the slide-bars, the cross-head connection therefrom to the driving-shaft, the multiplying-pinion carried by the cross-head, and the rack-teeth on the guideways and operating-bar, substantially as described.



405,637. STRAIGHT-KNITTING MACHINE. FRANK WILCOMB, Providence, R. I., assignor to the Wilcomb Manufacturing Company, San Francisco, Cal. Filed Feb. 29, 1888. Serial No. 265,735. (No model.)

Brief.—The straight parts of the cam-path on each side of the

405,637.

405,638.

stitch-cam are movable on inclined guides, so the needles can be exposed and rendered accessible. The ends of the slides are formed to maintain a groove of uniform width in all positions.

Claim.—1. In combination, the slide-bar, a fixed part of the needle-path having the inclined edge, the inclined guides, the cam movable on the inclined guides having a longitudinal groove and formed with its end adjacent to the fixed part of the needle-path also inclined, and mechanism for moving the movable cam, substantially as described.

2. In combination, the slide-bar, a fixed part of the needle-path having the inclined edge, the inclined guides, the cam movable on the inclined guides having a longitudinal groove and formed with its end adjacent to the fixed part of the needle-path also inclined, the parts of said inclined end above and below the needle-path being in different but parallel planes, and mechanism for moving the movable cam, substantially as described.

3. In combination, the slide-bar, the fixed part of the cam of a knitting-machine having a needle-path 7 7 and inclined edges, the parts of which above and below the needle-path are in different but parallel planes, and cams B B, having longitudinal grooves *b* and inclined ends corresponding to the edges of the fixed part, and means for moving the cams B, all substantially as described.

4. In combination with the slide-bar A and the switch-cam, the slide C, and stud D, a segmental notched plate *f*, fixed to the stud D and projecting over the upper surface of the bar A on one side of its slot, and a spring-detent arranged to hold the slide-plate C and cam in normal position in relation to the slide-bar A, all as set forth.

5. In combination, the slide-bar, a movable cam, inclined guides therefor, and a key located in an inclined groove formed in the movable cam, substantially as described.

405,638. STRAIGHT-KNITTING MACHINE. FRANK WILCOMB, Providence, R. I., assignor to the Wilcomb Manufacturing Company, San Francisco, Cal. Filed Apr. 13, 1888. Serial No. 271,026. (No model.)

Brief.—The invention consists in improvements upon the mechanisms presented in Letters Patent No. 350,791, dated October 12, 1886, whereby great rapidity, accuracy, and ease of movement are secured, and the capacity of the machine enlarged.

Claim.—1. In combination with the slide-bar, a shifting cam-plate for the transfer movement of the needles, a handle for the said cam-plate, a main shaft and operating mechanism therefrom to the cam-plate, and a detachable connection between said mechanism and the cam-plate, whereby said plate may be operated automatically or disconnected for hand operation, substantially as described.

2. In combination with the slide-bar, a shifting cam-plate for the transfer movement of the needles, an eccentric or cam in connection with the shifting plate for giving a varying movement thereto in advancing and retracting, a main shaft, and positively-operating connections independent of the slide-bar to the eccentric or cam for imparting the movement of the shaft thereto, substantially as described.

3. In combination with the slide-bar, a shifting cam-plate, a rotating disk having an eccentric groove, an operating-bar, one end of which is in connection with the shifting cam-plate and the other with the walls of the eccentric groove, a main shaft, mechanism for operating the slide-bar, and mechanism for rotating the disk operated from the main shaft independent of the slide-bar, substantially as described.

4. In combination with the slide-bar, a shifting cam-plate, a main shaft, a revolving shaft 38, operating connections from said shaft to the main shaft, an eccentric disk and operating connections therefrom carried on the slide-bar splined to and operated from the shaft 38, and operating connections between the eccentric and shifting cam-plate, substantially as described.

5. In combination with the slide-bar, a shifting cam-plate, an eccentric or cam for operating the shifting cam-plate carried on the slide-bar, a shaft 38, for operating the eccentric or cam having a splined connection therewith, a rack and pinion in shifting relation to each other, connections therefrom to the shaft 38, a main shaft for operating the rack, and intermediate mechanism between the main shaft and the rack and pinion for shifting them into or out of engagement, and pattern mechanism for controlling said connections, substantially as described.

6. In combination, the needles, the slide-bar, the shifting cam-plate, an eccentric disk and connections therefrom to the said cam-plate, the said disk being supported on the slide-bar, a shaft 38, extending parallel with said slide-bar, connections from the shaft to the disk, a driving-shaft, and operating connections between the shaft 38 and the said driving-shaft, substantially as described.

7. In combination, the needles, the slide-bar, a shifting cam-plate, an eccentric disk carried in the slide-bar, a connection between the disk and shifting cam-plate, consisting of the reciprocating bar i^3 and sliding plate C^{16}, the shaft 38, for rotating the eccentric disk having a sliding connection therewith, a rack and pinion, and an operating-chain therefrom to the shaft 38, substantially as described.

8. In combination, the needles, the slide-bar, a shifting cam-plate, an eccentric disk carried on the slide-bar, and a detachable connection between the disk and shifting cam-plate, consisting of the reciprocating bar i^3, the sliding plate C^{16}, the handle 31, and the locking-catch i^7, the shaft 38, having sliding connection with the eccentric, a main shaft, and operating connections to the shaft 38, substantially as described.

9. In combination, the needles, the slide-bar, a shifting cam-plate, an eccentric disk carried on the slide-bar, connections between said disk and the shifting cam-plate, a shaft 38, extending parallel to the slide-bar, a gear splined on said shaft, and a gear on the opposite face of the eccentric disk meshing with the gear on the shaft 38, a main shaft, and connections to the shaft 38, substantially as described.

10. In combination, the needles, the slide-bar, a shifting cam-plate, a sliding plate for operating the same, an eccentric disk carried on the slide-bar, a reciprocating bar i^3 between the disk and sliding plate, a beveled gear on the opposite face of the disk, a shaft 38, a sleeve splined thereto carrying a beveled gear meshing with the teeth of the gear on the disk, a rack and pinion, and a driving-chain therefrom to the shaft 38, substantially as described.

11. In combination, the slide-bar, a shifting cam-plate, a main shaft, a rack operated directly thereby in the direction of its length, a shifting pinion engaging said rack and operated by the movement thereof, a shaft 38, connections between said shaft and the shifting pinion, and operating devices between said shaft and the shifting cam-plate, a lever 43, connections from said lever to the pinion, a cam on the main shaft, a shifting roller on the lever 43, adapted to be operated by said cam, and pattern mechanism for controlling the movement of the shifting roller, substantially as described.

12. In combination, the slide-bar, a shifting cam-plate, a main shaft, a rack and pinion in shifting relation to each other, a shaft 38, a connection between said shaft and the pinion, and operating devices between said shaft and the shifting cam-plate, a lever 43, a cam on the main shaft for operating said lever, connections between said lever 43 and the pinion, a pattern mechanism for controlling the action of the lever 43, a locking-catch for holding the rack and pinion into or out of engagement, and means for actuating the catch, substantially as described.

13. In combination, the slide-bars, shifting cam-plates, a main shaft, racks operated directly thereby, a pair of shifting pinions engaging said racks, intermediate operating devices between said shifting pinions and the shifting cam-plates, including the shafts 38, levers 43 44, connections from said levers to the shifting pinions, cams on the main shaft for operating said levers, a pattern mechanism for controlling the action of said levers, a locking-catch for holding one pinion out of engagement and the other pinion into engagement with the racks, and means for actuating the catch, substantially as described.

14. In combination, the slide-bar, a shifting cam-plate, a main shaft, a rack operated directly thereby, a shifting pinion for engaging said rack, a shaft 38, and connections from said shaft to the shifting pinion and to the shifting cam-plate, a lever 43, a cam on the main shaft for operating said lever, connections from said lever to the shifting pinion, pattern mechanism for controlling the operation of the lever 43, a locking-catch 67, mounted on the spindle *y'* under spring tension, a projection on the lower end of said spindle, and a cam in the path of the projection for operating the catch, substantially as described.

15. In combination, the slide-bar, the shifting cam-plate, a main shaft, a rack operated directly thereby, a shifting pinion engaging the rack, a shaft 38 and connections from said shaft to the shifting pinion and to the shifting cam-plate, a lever L in connection with the pinion for engaging or disengaging the same with the rack, a lever 43, a cam on the shaft for operating said lever, operating connections between said lever and the shifting-lever L, and pattern mechanism for controlling the operation of the lever 43, substantially as described.

16. In combination, the slide-bar, the shifting cam-plate, a main shaft, a rack operated directly thereby, a shifting pinion engaging the rack, a shaft 38, connections between said shaft and the shifting pinion and between said shaft and the shifting cam-plate, a pivoted lever L for shifting the pinion, a spring in connection with one end of the lever for holding it normally in one position, a lever 43, connections therefrom to the opposite end of the lever L for causing the shifting action, means for operating the lever 43, and pattern mechanism for controlling the operation of the said lever, substantially as described.

17. In combination, the slide-bar, the shifting cam-plate, a main shaft, a rack operated directly thereby, a shifting pinion engaging said rack, connections between the pinion and the shifting cam-plate, a shifting-lever L, a lever 43 for operating lever L, with operating connections between the two, a shifting roller on the lever 43, a cam on the main shaft adapted to operate the lever 43 through its roller when the said roller is shifted into range therewith, a pattern mechanism, and connections between the pattern mechanism and the roller for shifting the same, whereby the lever 43 is depressed and the pinion shifted into engagement with the rack and the needles operated.

18. In combination, the slide-bar, the shifting cam-plate, a main shaft, a rack and pinion in shifting relation to each other, connections between the pinion and shifting cam-plate, a lever L for causing the engagement of the pinion and rack, a lever 43, connections between the levers 43 and L, a shifting roller on the lever 43, a pattern mechanism, a shifting-lever operated by said pattern mechanism for shifting the roller, a shifting cam on the main shaft for operating the lever 43 through its roller, and connections from the pattern mechanism to shift the said cam, substantially as described.

19. In combination, the slide-bar, the shifting cam-plate, a main shaft, a rack and pinion in shifting relation to each other, connections between the pinion and shifting cam-plate, a lever L, a lever 43, connections between the levers 43 and L, a shifting roller on the lever 43, a shifting cam on the main shaft, a cam-piece *m* carried thereby, a pattern mechanism, and connections extending therefrom and operated thereby to the shifting roller and cam for causing the shifting action thereof, substantially as described.

20. In combination, the slide-bar, the shifting cam-plate, a main shaft, a wheel K thereon, a rack on its periphery, a shifting pinion, connections therefrom to the shifting cam-plate, a lever 43, connections between said lever and the shifting pinion, a cam on the main shaft for operating lever 43, a pattern mechanism, and connections therefrom for controlling the operation of the lever 43, substantially as described.

21. In combination, the slide-bar, the shifting cam-plate, the rack and pinion in shifting relation to each other, operating devices between the pinion and shifting cam-plate, the lever 43, connections therefrom to the pinion, a shifting roller on the lever 43, a main shaft, a cam-piece carried thereby for depressing the lever 43 through its roller, a constantly-operating lever N, a lever, as M^2, with connections to the shifting roller, a cylinder N^2, stops thereon for preventing the movement of the lever M^2, means for operating the cylinder, and a pattern mechanism for controlling the action of the same, substantially as described.

22. The slide-bar, the shifting cam-plate, a main shaft, a wheel K thereon, a rack *l* on said wheel, a shifting pinion, connections between said pinion and the shifting cam-plate, means for shifting said pinion into and out of engagement with the rack *l*, a flange on said pinion having a cut-away portion adapted to grooves and plain portions on the wheel K, substantially as described.

23. In combination, the slide-bar, the shifting cam-plate, the eccentric disk, connections therefrom to the shifting cam-plate, a shaft 38 having sliding connection with the disk, a rack, a main shaft, a shifting pinion, a sprocket-chain between the pinion and shaft 38, a shifting-lever L, a lever 43, a band l^2 between the levers 43 and L, a main shaft, a shifting cam thereon, a shifting roller on the lever 43, a constantly-operating lever N, a lever M^2, connections therefrom to the shifting roller, a cylinder N^2, stops thereon for preventing the movement of the lever M^2, devices for operating the cylinder, and a pattern mechanism for controlling the action of said cylinder, substantially as described.

24. In combination, a point-carriage, a threaded shaft for moving said carriage laterally, and a point-block supported on said carriage and having forward and backward movement independent of the movement of the carriage, and means for imparting such movement thereto, substantially as described.

25. In combination, a point-carriage, a point-block thereon, a threaded shaft for moving the carriage laterally, means for moving the threaded shaft, a second shaft R', having splined connection with the carriage, means for actuating said shaft, and a pinion and rack between said shaft and the point-block, substantially as described.

26. In combination with the point-carriage, a point-block thereon, a shaft R^2, threaded to engage said carriage and to move it laterally, the shafts R' R^2, and splined connections between said shafts and the carriage and point-block for imparting to the said point-block forward, backward, and lifting movement, with means for operating said shaft, substantially as described.

27. In combination, a threaded shaft R^2, means for moving the same, a point-carriage movable laterally thereon, a sliding plate Q' on said carriage, a point-block pivoted on said sliding plate, a second shaft R', means for actuating the same, a pinion splined thereon, and a rack on the sliding plate Q', engaging said pinion, substantially as described.

28. In combination, a threaded shaft R^2, a point-carriage movable laterally by the revolution of said shaft, a pivoted point-block supported by said carriage, means for moving said point-block forward and backward, a rock-shaft R^2, and arms r^{21}, supported from said shaft, substantially as described.

29. In combination, a threaded shaft, means for moving the same, a point-carriage mounted thereon, a sliding plate Q', a point-block pivoted on said plate, a second shaft R', means for actuating said shaft a pinion splined thereto engaging a rack on the sliding plate to advance and retract the point-block, a third shaft R^2, arms supported therefrom having inclines, and a spring in connection with the point-block.

30. In combination, a laterally-movable point-carriage, a point-block thereon carrying points, a threaded shaft for imparting lateral movement to said carriage, operating mechanism for said threaded shaft, a main shaft for imparting movement to said mechanism, a pattern mechanism for controlling the action of the threaded shaft, and intermediate mechanism between the pattern mechanism and the main shaft for effecting this controlling action, whereby the rotation of the shaft R^2 is made intermittent, substantially as described.

31. In combination with the point-carriages on opposite sides of the machine, a threaded shaft for each carriage, said shafts being formed with zigzag grooves having cam-faces, a main shaft with operating connections between said main shaft and the threaded shaft on each side of the machine, a pattern mechanism, and operating connections from said pattern mechanism for controlling the action of the

threaded shafts, and stationary pins on the frame engaging with said grooves, the cam-faces of one shaft being set reversely to the other, whereby one threaded shaft is rendered inoperative and the carriage on the other advanced its full distance, substantially as described.

32. In combination with the point-carriages on opposite sides of the machine, a threaded shaft for each carriage, said shaft being formed with zigzag grooves having cam-faces, a main shaft, connections from the said shaft to the two threaded shafts for operating them simultaneously, a pattern mechanism for controlling the action of said operating connection, whereby the movements of the two shafts are intermittent, and a stationary pin in connection with the zigzag grooves, the cam-faces being set reversely to each other, whereby the threaded shaft on one side of the machine is rendered inoperative, while the carriage on the other is advanced its full distance, substantially as described.

33. In combination with the point-carriages on opposite sides of the machine, a threaded shaft for each carriage, said shafts being formed with zigzag grooves having cam-faces, a main shaft, a shaft 91, operating mechanism between the main shaft and shaft 91, a pattern mechanism with connections for controlling said operating connections to make the movements of the threaded shaft intermittent, a connection between said shaft 91 and the two threaded shafts for turning the same simultaneously to partially advance the point-carriages, and stationary pins engaging with said zigzag grooves, the cam-faces of one shaft being set reversely to the other, substantially as described.

34. In combination, a point-carriage, a threaded shaft for moving it laterally, a main shaft, a lever s' operated therefrom, and operating connections between said lever and the threaded shaft, substantially as described.

35. In combination, a point-carriage, a threaded shaft for moving it laterally, a shaft 91, a chain-connection therefrom to the threaded shaft, a main shaft, a cam thereon, a lever s' operated therefrom, a connection between the lever s' and shaft 91, and pattern mechanism for controlling the operation of the lever s', substantially as described.

36. In combination, the point-carriages on opposite sides of the machine, a pair of threaded shafts for moving said carriages laterally, a shaft 91, an operating connection from shaft 91 to both the threaded shafts, a main shaft, the lever s' operated thereby, a ratchet-wheel on the shaft 91, a pair of reversely-operating pawls, and connections from the lever s' to each of said pawls, substantially as described.

37. In combination with the lever s', a threaded shaft, a point-carriage movable laterally thereby, connections from the lever s' to the threaded shafts, a main shaft, and a cam s^4 on the main shaft for operating the lever s', substantially as described.

38. In combination with the lever s', a threaded shaft, a point-carriage movable laterally on the threaded shaft, connections between the lever s' and the threaded shaft, a main shaft, a cam thereon for operating the lever s', a rocking shaft, pattern mechanism, and connections to the rocking shaft for controlling the action of the lever s', substantially as described.

39. In combination, the lever s', the threaded shaft, connections between the lever s' and threaded shaft, a point-carriage on the threaded shaft, a main shaft, a disk on said shaft, a cam-flange s^4 on said disk, a wheel on the lever s', playing normally on the periphery of the disk, the rock-shaft s^5, a liver 93, connected to the rock-shaft, a shifting cam for operating the rock-shaft, pattern mechanism, and connections therefrom to shift the cam, substantially as described.

40. In combination with the point-carriage, a pivoted point-block thereon, arms r^{31} for depressing said points, a lever 85, means for operating said lever, and connections from said lever to the arms r^{31} for rocking the same, substantially as described.

41. In combination with the point-carriage, a pivoted point-block, a rocking shaft R^3, arms r^{31}, carried by said shaft, a lever 85, a rod between said lever and shaft R^3, a main shaft, a cam on said shaft for operating the lever, and a spring for retracting said lever, substantially as described.

42. In combination with the main shaft, a set of shifting cams carried on splines on said shaft, a reciprocating pin U, means to reciprocate said pin, the lever v, the cylinder, controlling-stops on said cylinder for the lever v, a pattern-chain, and a controlling connection between said pattern-chain and cylinder, substantially as described.

43. In combination with the main shaft and shifting cam thereon, the constantly-operating levers M^3 and v', connections between said levers and the shifting cam, the cylinder N^3, controlling-stops thereon for preventing the movement of the levers M^3 and v', the lever N for operating the levers M^3 v', a constantly-operating pawl, a ratchet-wheel on the cylinder N^3, normally inoperative under the movement of said pawl, and a pattern mechanism for causing the pawl to engage with the ratchet-wheel and thereby move the cylinder, substantially as described.

44. In combination with the main shaft and shifting cam thereon, the levers M^3 v', means for operating said levers, connections between said levers and the shifting cam, a controlling-cylinder having stops thereon for preventing the movement of the levers M^3 v', and a pattern mechanism controlling the action of the cylinder, substantially as described.

45. In combination with the needles and points of a knitting-machine, a pattern-chain, a supplemental controlling mechanism, connections between the pattern-chain and controlling mechanism, shifting cams on the main shaft, connections between the controlling mechanism and the said cams, operating-levers moved by the said cams, and connections from said cams to the needles and transfer-points, substantially as described.

46. In combination with the needles and points of a knitting-machine, a pattern mechanism, a main shaft, a supplemental controlling mechanism, intermediate connections therefrom to the main shaft, consisting of a ratchet-wheel having irregular teeth and a constantly-operating lever N' and pawl, connections from the primary pattern-chain to move the ratchet from normal position, cams on the main shaft, operating-levers for the needles and points actuated thereby, and connections between said levers and the points and needles, substantially as described.

47. In combination, the slide-bar, the shifting cam-plate, the point-carriage and points, the operating-lever 43, the shifting cams on the main shaft, the oscillating levers M^3 and v', means to oscillate said levers, devices between lever M^3 and lever 43 and between the lever v' and the shifting cams, the cylinder N^3, the stops thereon for controlling said oscillating levers, and the pattern mechanism for throwing the cylinder N^3 into action, substantially as described.

48. In combination, the slide-bar, the shifting cam-plate, the needles, the lever 43, having shifting roller, and connections from said lever to the shifting cam-plate, the oscillating-lever M^3, connections therefrom for operating said shifting roller, the transfer-points, a main shaft, the shifting cam thereon, the lever operated thereby, with connections to the transfer-points, the oscillating lever v', the switch-pin U, the cylinder having controlling-stops thereon, the pawl and ratchet, the lever N', carrying said pawl, operated by the tappet 52, the supplemental lever N for operating the oscillating levers, the pawl and disk o for moving the cylinder from normal position, pattern mechanism, and connections therefrom to the said pawl for moving the same, substantially as described.

49. In combination, the slide-bar, the shifting cam-plate, the needles, the transfer-points, the shifting cams on the main shaft, levers actuated by said cams when shifted, operating connections from said levers to the shifting cam-plate and to the transfer-points, a controlling-cylinder, means for actuating the same, constantly-operating levers governed by the controlling-cylinder and adapted to be arrested thereby, and a pin operated by one of said levers and adapted to shift the cams on the main shaft, substantially as described.

50. In combination, the needles, the lifting-bar for elevating the empty needles, the screw-shaft for operating the lifting-bar, the main shaft, and positive connections therefrom to the screw-shaft, substantially as described.

51. In combination, the needles, the lifting-bars on each side of the machine for raising the empty needles out of action, a screw-shaft for operating each lifting-bar, cam-grooves in each screw-shaft set reversely to each other, stationary pins engaging said grooves, a main shaft, and connections from said main shaft to the screw-shafts for giving them simultaneous action, substantially as described.

52. In combination with the needles, the lifting-bar on each side of the machine for throwing them out of work, a threaded shaft for operating each bar, a point-carriage, a threaded shaft for operating each point-carriage, a main shaft, and connections from said main shaft to the four threaded shafts of the point-carriages and lifting-bars, substantially as described.

53. In combination with the needles, the lifting-bar for throwing them out of work, a main shaft, a notched disk and pawl, operating connections between said pawl and the main shaft, a screw-shaft for operating the lifting-bar, and connections from the disk to the screw-shaft, substantially as described.

54. In combination, the thread-guide, a reversible spindle therefor, the carriage-frame, the guide-bars, the operating-bar adapted to move up and down, means for actuating said bar, and connections between said bar and the spindle, substantially as described.

55. In combination, the thread-guide and spindle, the raising and lowering operating-bar, connections between said bar and spindle, the guide-bars, the adjustable stops, and operating connections between said stops and the operating-bar, substantially as described.

56. In combination, the thread-guide and spindle, the raising and lowering bar, connections between said bar and spindle, the brackets, connections between said brackets and bar, adjustable stops, and connections to the brackets, substantially as described.

57. In combination, the thread-guide and spindle, the brackets, the raising and lowering operating-bar, connections between said bar and spindle, and connections between said bracket and bar, consisting of the slotted plate A^3, and the studs on the operating-bar fitting said slots, the bar A^4 between the brackets, and the adjustable stops on said bar, substantially as described.

58. In combination with the main shaft and shifting cam thereon, the constantly-operating levers M^3 and v', connections between said levers and the shifting cams, the cylinder N^3, stops thereon for controlling the levers M^3 v', the ratchet on the cylinder, the lever N', the cam constantly operating the same, the lever N, operated by the lever N' for operating the levers M^3 and v', and the pawl carried by the lever N' for operating the cylinder N^3, substantially as described.

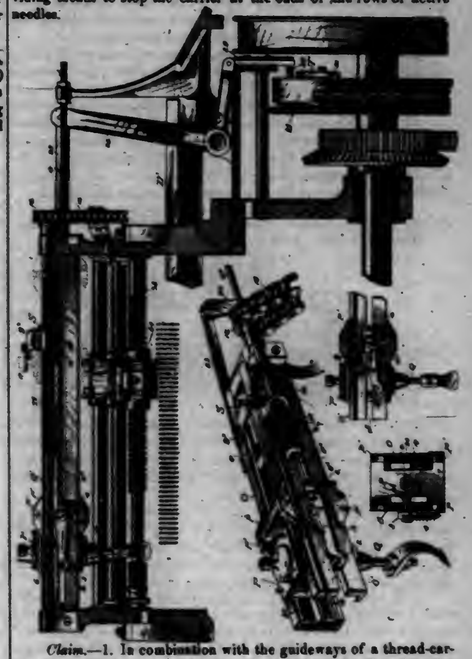
405,639. STRAIGHT-KNITTING MACHINE. FRANK WILCOXS, Providence, R. I. Filed Nov. 10, 1888. Serial No. 290,463. (No model.)

Brief.—The object of the invention is to provide improved means for raising the needles out of work in narrowing, and for returning them to work in widening, in the operation of knitting fashioned goods upon a straight-knitting machine.

Claim.—1. In combination with the needles of a knitting-machine, a slotted slide having needle-raising point and bearing-surface, a second slide arranged alongside of the first slide and having a bearing for the needles, means for moving the first slide, and means for moving the second slide after movement of the first, substantially as described.

2. A slide for raising the needles of a knitting-machine out of work, having a needle-raising point and slot and a bearing-surface for the needles, in combination with a series of needle-holding slides having bearing-surfaces to hold down the needles, all the slides being loosely connected, and a fixed bearing-surface on the needle-bed, all substantially as and for the purpose explained.

3. Slides for raising the needles of a knitting-machine out of work—one arranged at each end of the row and each having a needle-raising point and slot—a cap with a bearing for the needles fixed to the needle-bed, and bearings or slides moved by the needle-lifting slides, all substantially as described.



4. In combination with the needle-raising slide of a knitting-machine, a threaded shaft and a nut connected to the slide, substantially as described.

5. In combination with the needles of a knitting-machine, a pair of slides—one arranged at each end of the row and each provided with a needle-raising point—a slot to receive the inactive needles, and a bearing for holding the needles down, and a fixed bearing-surface, substantially as described.

6. In combination with the needles of a knitting-machine, a slide having a needle-raising point and slot and bearing-surface, and a second slide having a bearing for the needles, and a connection between the first and second slides, whereby the former moves the latter and the bearings of both are made to rest on the same needles, substantially as described.

405,640. STRAIGHT-KNITTING MACHINE. FRANK WILCOXS, Providence, R. I. Filed Nov. 14, 1888. Serial No. 290,849. (No model.)

Brief.—The object of the invention is to relieve the yarn take-up devices by preventing the excessive amount of slack usually formed at the ends of the reciprocations of the yarn-carrier, especially when some of the end needles are out of operation in narrowing, by providing means to stop the carrier at the ends of the rows of active needles.

Claim.—1. In combination with the guideways of a thread-carrier of a knitting-machine and the slide-bars thereof, a thread carrier and guide, a detachable connection between said carrier and the slide-bars, an automatically-movable stop arranged to operate upon said detachable connections, and means for moving the stop, substantially as described.

2. In combination with the guideways of the thread-carrier of a knitting-machine and the slide-bars thereof, a thread carrier and guide, a detachable connection between the said carrier and the slide-bars, a stop arranged to operate upon the said detachable connections, a yarn-guide-reversing mechanism on the carrier, a cam-slide in connection therewith, a main driving-shaft, and connections between the cam-slide and the said main driving-shaft, substantially as and for the purpose set forth.

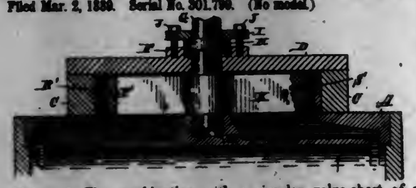
3. In combination with the guideways of the thread-carrier of a knitting-machine and the slide-bars thereof, a thread carrier and guide, a detachable connection between the said carrier and the slide-bars, a movable stop for operating the detachable connection, a point-carrier, mechanism for moving the stop and carrier in unison, a guide-reversing device on the thread-carrier and a cam-slide therefor, a main driving-shaft, and connections between the cam-slide and said shaft, all substantially as and for the purpose set forth.

4. In combination with the guideways of the thread-carrier of a knitting-machine and with the slide-bars thereof, a thread carrier and guide, a detachable connection between said carrier and slide-bars, a threaded shaft, and a stop movable thereon and adapted to operate the detachable connections between the carrier and slide-bars, substantially as described.

5. In combination with the guideways of the thread-carrier of a knitting-machine and the slide-bars thereof, a thread carrier and guide, a detachable connection between the said carrier and the slide-bars, a threaded shaft, a stop movable thereon, a point-carrier, a shaft for moving the same, and connections between the stop-shaft and the point-carrier shaft, substantially as described.

6. In combination with the spindle of the thread carrier and guide, the reversing devices immediately connected therewith, a channeled bar and a slide-bar for vertically moving said bar, a main shaft, and connections between said channeled bar and the main shaft, substantially as and for the purpose set forth.

7. In combination with the reversible thread-guide, driving means



therefor, a movable stop, and detachable connections between said stop and driving means, whereby a variable stroke is imparted to the carrier, a main shaft, and devices connecting the main shaft with the carrier for reversing the said carrier, substantially as described.

8. In combination with the thread-carrier and its reversible guide, reversing mechanism, the slide for operating the reversing mechanism, a bell-crank lever connected therewith, a main shaft, and a pivoted cam moving with the main shaft, and a connection between said cam and bell-crank lever, all substantially as described.

9. In combination with the thread-carrier and its reversible guide, the cam-slide for reversing said guide, a main shaft, a pivoted cam moving with the main shaft, and intermediate connections to the cam-slide controlled by said cam to the cam-slide, substantially as described.

10. In combination with the cross-head and with the thread-carrier, a catch on the cross-head engaging with the thread-carrier, a movable stop arranged to operate the catch, a spring-catch on the movable stop arranged to engage with the carrier, and operating-mechanism for the cross-head and stop, substantially as described.

405,641. STEAM-VALVE. JOHN H. WILLIAMS, Urbana, Ohio. Filed Mar. 2, 1889. Serial No. 301,790. (No model.)

Claim.—1. The combination, with a circular valve-chest, of a valve and its adjustable central arbor, means to adjust said arbor inward and preserve contact between the valve and the face of the chamber, and suitable packing between the ends of the valve and the upper side of the valve and the casing.

2. The combination, with a circular valve-chest, of an oscillating valve fitted therein, and suitable packing interposed between its ends and upper side and the said chamber, and the valve-arbor centrally mounted in said chamber, and devices to adjust it inward to keep the valve in constant contact with the surface of the chamber.

3. The combination, with a steam-cylinder and its circular valve-chest, a bearing in the cylinder, and a central opening in the chamber-cap, of a valve fitted to oscillate within said chamber and having spring-actuated packing-strips between its ends and its upper edge and the valve-chamber, the valve-arbor mounted in said bearing and opening and having a shoulder, a plate fitted on the arbor against said shoulder, and adjusting-screws connecting the plate with the cap.

4. The combination, with a circular valve-chamber, a flanged cap, and a central opening in the cap, and a recess within the flange, of a valve mounted in the chamber, and its arbor fitted to the central opening in the cap and having a shoulder which fits said recess, an adjusting-plate embracing the shaft and fitted against the shoulder, and screws which connect said plate with said flange.

5. The combination, with a circular valve-chest, of a valve mounted therein and recessed on its upper side and at its ends, and extensible packing-strips mounted in said recesses, and springs between said strips and said valve to project the strips upward and outward.

6. The combination, with the valve consisting of an oscillating bar grooved on its upper side and at its ends, of packing-strips fitted in said grooves and composed of overlapping sections, the outer section of which having a vertical part which fits the end recesses, and springs which press the sections upward, and other springs which respectively press the outer sections upward, and the vertical part of such sections outward.

7. The combination, with a circular valve-chest, of a valve mounted therein and recessed on its upper side and at its ends, of packing-strips mounted in said upper and end recesses, and springs between the upper and end sections or portions of the extensible strips, and other springs to project said strips upward and outward.

8. The combination, with a valve, of extensible packing-strips consisting of upper horizontal sections, a grooved vertical part, and the strip divided into two sections and fitted into said groove, and springs between the horizontal sections and the sections in said groove, whereby the parts are distended from each other.

405,642. VETERINARY SURGICAL INSTRUMENT. ISAAC M. WOOSLEY, Albany, Oreg. Filed May 1, 1888. Serial No. 308,219. (No model.)

Claim.—1. The combination of the handles, curved serrated jaw, and cutting-blade, with the spring-controlled and serrated segment, substantially as described.

2. The combination of the shears, constructed substantially as described, with a curved serrated rocking segment mounted on the

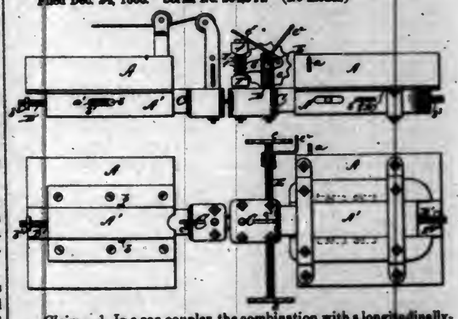
cutting-blade of the shears having downwardly and forwardly inclined slotted lugs and engaging serrations in the jaw thereof, substantially as described.

3. The combination of the handles, beveled pins and spring thereon, the serrated jaw and cutting-blade, with the serrated rocking segment mounted on said blade, and the spring secured to said blade and engaging the segment, substantially as and for the purpose described.

4. The combination of the handles, serrated jaw, the curved and serrated cutting-blade attached to one of said handles, the serrated rocking segment and its slotted lugs, the pins attaching said segment to the blade, and the spring engaging said segment, substantially as and for the purpose described.

5. The combination of the handles A B, the beveled pins L *l*, and spring M, the curved serrated jaw C, and the cutting-blade D, with the serrated segment F, having depending slotted lugs G G, the pins engaging said slots and securing the segment to the blade, and the spring J, all substantially as and for the purpose described.

405,643. WHIFFLETREE-HOOK. CHARLES WRIGHT, South Elgin, Ill. Filed Mar. 29, 1888. Serial No. 305,201. (No model.)

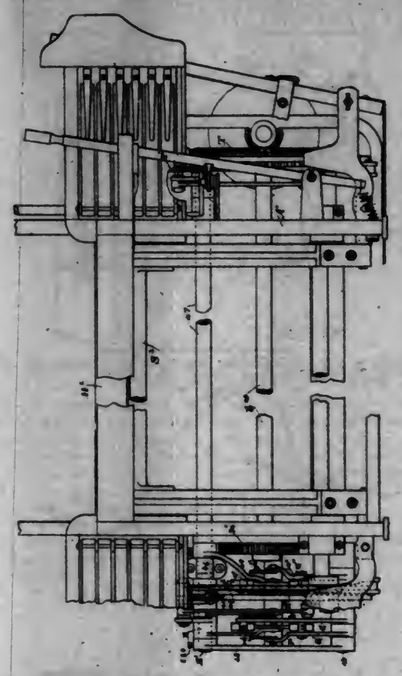


Claim.—1. The combination, with the tip formed with shoulders *e*, of the hook pivoted to said tip and formed with converging arms *c*, substantially as and for the purpose specified.

2. The combination, with the tip formed with longitudinal rib D, provided with recess *d* and tapered from opposite sides of said recess, of the hook pivoted to said tip at right angles to said rib, substantially as shown, and for the purpose described.

3. As an improved article of manufacture, a whiffletree-hook consisting of a tip formed near its outer end with shoulders *e*, and with longitudinal rib D, formed near its center with a recess *d*, and tapered from opposite sides of said recess, and the hook formed with cross-bar and converging arms and pivoted to said tip near the outer end thereof, at right angles to said rib, substantially as herein shown and described.

405,644. CAR-COUPLING. WILLIAM H. WRIGHT, Freeport, Ohio. Filed Dec. 24, 1888. Serial No. 294,544. (No model.)



Claim.—1. In a car-coupler, the combination, with a longitudinally-yielding draw-head, of a coupling-pin provided with a collar, posts secured to the draw-head, a spring-pressed stirrup adapted to slide on said posts, a standard secured to the draw-head in rear of said posts, a rock-shaft journaled in bearings on the standard and provided at its ends with hand-wheels, a rock-arm rigidly secured to the center of said shaft, a pivot-pin for connecting the free end of the rock-arm to the coupling-pin, and a spring-pressed follower mounted in the draw-head to support the coupling-pin.

2. In a car-coupler, the combination, with a car having a draw-head adapted to yield longitudinally in both directions, of a coupling-pin provided with a collar, posts secured to the draw-head, a spring-

pressed stirrup adapted to slide on said posts, a standard secured to the draw-head in rear of the posts, a rock-shaft journaled in bearings on the standard and provided near its end with a spring-arm, a hook on the car, with which said arm may be engaged, an arm rigidly secured to the center of the rock-shaft and pivotally connected at its free end to the coupling-pin, and a spring-pressed follower mounted in the draw-head to project normally beneath the end of the coupling-pin.

405,645. SHUTTLE-BOX MECHANISM FOR LOOMS. HORACE WYMAN, Worcester, Mass., assignor to the Crompton Loom Works, same place. Filed Feb. 7, 1883. Serial No. 263,272. (No model.)

Claim.—1. The shuttle-box pattern surface or chain, a shaft A^3, upon which it is mounted, reversing-gearing in operative connection with the said shaft, and the clutch-hub, combined with the cam of the controlling mechanism, means to rotate it intermittingly, and with means, substantially as described, between the said clutching-hub and cam to move the said hub, substantially as described.

2. The shuttle-box pattern surface or chain, a shaft A^3, upon which it is mounted, an actuating-shaft for imparting motion to the shaft A^3, gearing between the said shafts, clutch mechanism and means to rotate the clutch-mechanism gearing, a lever and intermediate connections to move the clutch-hub of the clutch mechanism, and controlling mechanism to actuate the said lever, combined with a pawl to engage the ratchet of the controlling mechanism, means to reciprocate the said pawl, and a pattern mechanism or jacquard, substantially as described, to determine when and for how many reciprocations the said pawl shall engage the said ratchet, as set forth.

3. The crank-shaft, the pin-wheel thereon, the sleeve having the star-wheel and gear D^7, the actuating-shaft D^{14}, the loose gears D^6 and D^9, having clutch-teeth, the clutch-hub splined on the said shaft between the said gears, the pattern surface or chain for the shuttle-box mechanism, its shaft A^3, gearing intermediate the shafts D^{14} and A^3, the lever 64, means to connect it with the said clutch-hub, the controlling mechanism, containing a cam and a ratchet-wheel, a pawl, and means to actuate it to rotate the controlling mechanism, combined with a series of shuttle-boxes and shuttle-box-actuating mechanism, substantially as described, to actuate the said shuttle-boxes under the control of the said pattern surface or chain, as set forth.

4. The rock-shaft 42, extended across the loom, fulcrum-carrying levers attached to the said shaft at opposite sides of the loom, an auxiliary main lever, means to move it, and connections between it and the said rock-shaft, two prime levers at opposite sides of the loom and having their fulcra on studs moving with the fulcrum-carrying levers, two series of shuttle-boxes and means to connect them with the said prime levers, a shaft 47, having arms 48 49, and connections between it and that one of the prime levers most distant from the shuttle-box pattern-surface, combined with the main lever, connections between it and the other prime lever, and means to actuate the said main lever and the said rock-shaft 47 independently, whereby two series of shuttle-boxes may be operated positively in both directions, substantially as described.

5. In combination, the following instrumentalities, viz: a rock-shaft 42, extended across the loom and provided with fulcrum-carrying levers, means to rock the said shaft positively, two prime levers, each mounted upon one of the said fulcrum-carrying levers, a main lever, means to connect it with one of the said prime levers, a rock-shaft 47, having arms, and connections between it and the other prime lever, two series of shuttle-boxes and connections between them and the said prime levers, and means to actuate the said main lever and rock-shaft independently and positively, substantially as described.

6. The rock-shaft 42, extended across the loom, the fulcrum-carrying levers attached thereto at opposite sides of the loom, the two prime levers 20 $20^{\times}$, sustained by the said fulcrum-carrying levers, the rock-shaft 47, means between it and the prime lever $20^{\times}$ to actuate the latter, and two series of shuttle-boxes and connections between them and the said prime levers, combined with means to actuate the said rock-shafts, and with means to move the prime lever 20 independently of the prime lever $20^{\times}$, substantially as described.

7. A pattern surface or chain, its carrying-shaft A^3, a shaft, as D^{14}, its two reversely-moving loose gears, gearing between the said shaft D^{14} and the said carrying-shaft, a gear to actuate the said loose gears, and a clutching-hub co-operating therewith to effect the rotation of the said pattern-shaft in one or the other direction, a controlling mechanism, its ratchet, the actuating-pawl, and means to move the pawl, combined with intermediate parts, substantially as described, between said controlling mechanism and said clutching-hub, whereby said hub may be caused to engage either of the reversely-moving gears, as determined by the controlling mechanism, substantially as described.

8. The main pattern surface or chain and means to rotate it intermittingly both in a forward and in a reverse direction, as described, combined with the controlling mechanism, its ratchet and pawl, means to move the pawl to turn the ratchet, and with means to control the time of engagement of the pawl with the ratchet, whereby through the controlling mechanism and the said means for rotating the main pattern-surface the said main pattern-surface may be oscillated, when desired, substantially as described.

9. The shaft A^3, the main pattern surface or chain, means to rotate the said shaft in one and then in the opposite direction, the controlling mechanism and devices, substantially as described, and means to actuate the cam of the controlling mechanism, combined with a supplementary pattern-surface, and means between it and the pawl for moving the cam of the controlling mechanism, whereby the controlling mechanism may be moved or left at rest, substantially as described.

10. The vibrators having their outer or free ends beveled in opposite directions, the toothed gears carried by the said vibrators, and gears to engage and move the same as desired, the lever 76, having the doubly or reversely inclined projection to act upon the said vibrators, and the sliding link 75, connected to the said lever and slotted at its other end and provided with a stud, combined with the cam $73^{\times}$, and a stud to guide the said link, the combination being in operation, substantially as shown and described.

11. The rock-shaft 42, extended across the loom, an auxiliary main lever E^2, means to move it, connections between the said lever and the said rock-shaft, a fulcrum-carrying lever attached to the opposite end of the said rock-shaft, a prime lever pivoted thereon, a series of shuttle-boxes and connections between it and one end of the said prime lever, a shaft 47, having arms 48 and 49, connection between it and the other end of the said prime lever, and means to actuate the said shaft 47 independently of the rock-shaft 42, substantially as described.

12. The auxiliary main lever, means to move it, and connections between it and the rock-shaft 42, combined with the said rock-shaft, the fulcrum-carrying lever $22^{\times}$, mounted upon a stud attached to the opposite end of the said rock-shaft, the prime lever $20^{\times}$, pivoted upon the said fulcrum-carrying lever, a series of shuttle-boxes, connections between it and the said prime lever, and means to actuate the prime lever, substantially as described.

13. The rock-shaft 47, its arms 48 and 49, fast thereon and constituting a main lever, means to actuate the said rock-shaft, the rod $f^{\times}$, and the prime lever $20^{\times}$, and a fulcrum for the said prime lever, combined with the series of shuttle-boxes and with connections between the said prime lever and the series of shuttle-boxes, to operate substantially as described.

14. A shaft, as D^{14}, two reversely-moving gears loose thereon and having clutching-teeth, a gear to rotate the said loose gears in

nemon, a clutching-hub splined on the said shaft between the said loose gears and having teeth to be engaged by the clutch-teeth of one or the other of the said loose gears according to the direction it is desired to rotate the said shaft D^{14}, combined with a controlling mechanism, its ratchet and actuating-pawl, and means to move said pawl, and with intermediate parts, substantially as described, between said controlling mechanism and said clutching-hub, whereby said hub may be caused to engage either of the reversely-moving gears, as determined by the controlling mechanism, substantially as described.

405,646. ELECTRICAL PRIMER. EDMUND L. ZALINSKI, U. S. Army, and HENRY J. SMITH, Pompton, N. J. Filed Nov. 13, 1888. Serial No. 290,682. (No model.)

Claim.—1. An electrical primer consisting of the conducting-wires and a bridge, an explosive surrounding the bridge, and a solid non-explosive piece inclosing and supporting said bridge and its attached priming, substantially as described.

2. In an electrical primer, the combination of the conducting-wires, the bridge, an explodent surrounding the bridge, a solid surrounding and supporting piece of non-explosive material adapted to fit the commercial detonator, and an adherent covering therefor, substantially as described.

3. The conducting-wires having a non-conducting textile covering connected by stitches passing through the textile covering between the wires near the bridge, combined with the platinum bridge connecting the terminals of said wires, all combined substantially as described.

4. In an electrical primer, the conducting-wires, bridge surrounded by explosive material, a water-proof covering for said bridge and coating, and an incasing-piece of non-explosive material cast or molded thereon and shaped to fit the commercial detonator, substantially as set forth.

5. In an electrical primer, the combination of the conducting-wires, the bridge and its igniting-priming, the inclosing solid supporting-piece of non-explosive material, and a waterproofing and adherent covering for the exterior of the said piece, substantially as described.

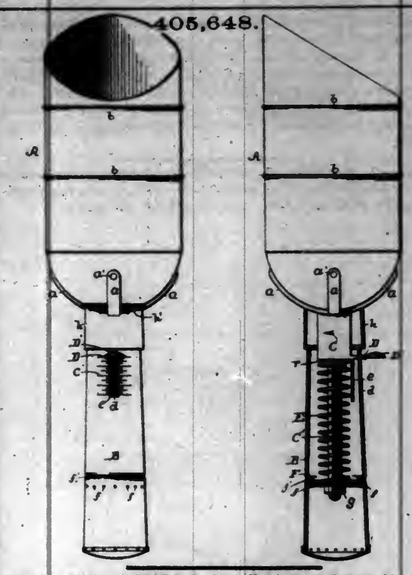
405,647. DELAY-ACTION PRIMER. EDMUND L. ZALINSKI, U. S. Army, and HENRY J. SMITH, Pompton, N. J. Filed Nov. 23, 1888. Serial No. 291,679. (No model.)

Claim.—1. The combination, with an electric igniter and a detonator of the character described, of an interposed delay-action primer or time-fuse, substantially as described.

2. A delay-action primer consisting of a charge-holder chambered to receive an electrical igniter and shaped to fit a commercial detonator and having a slow-burning or time charge contained in said holder, substantially as stated.

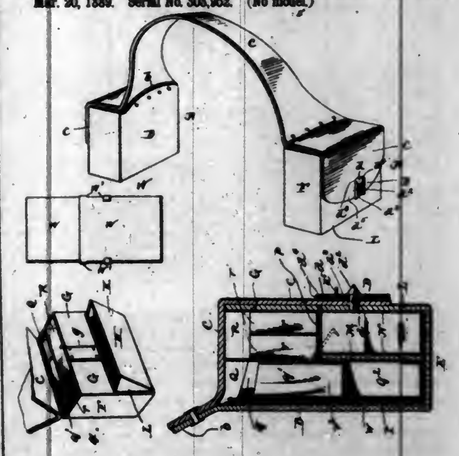
3. A delay-action primer consisting of a charge-holder having vents, a time-charge contained in said holder, a chamber to receive an electrical igniter in proximity to said charge, and being shaped to fit the commercial detonator, substantially as described.

4. The combination, with the charge-holder of a shape to fit the detonator and having a chamber for the igniter, of a time-charge contained in said holder with a water-proof coating covering said burning charge.



5. The combination, with an electric igniter and a detonator, of a separate delay-action charge-holder shaped to connect both.

6. The delay-action charge-holder described chambered to receive the igniter, shaped to fit the commercial detonator, and covered with a coating of water-proof material, substantially as described.

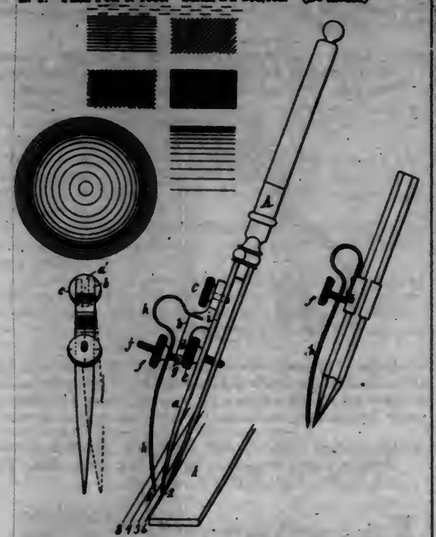


405,648. WEIGHING AND MEASURING SCOOP. LOUIS ZWINGLER, Kansas City, Mo., assignor of one-half to Joseph Moncion, same place. Filed Feb. 13, 1888. Serial No. 263,716. (No model.)

Claim.—In a weighing-scoop, the combination of a bowl, a spring-encircled rod having its upper end connected to said bowl, the hollow handle having a slot in one side, a partition or diaphragm located in the handle, a nut fitted upon the inner end of said rod in contact with said partition or diaphragm, a series of graduations formed upon said handle at the sides of said slot, and the combined index and thumb-piece D', projecting through said slot in the handle, substantially as and for the purpose specified.

405,648.

405,649. SADDLE-BAG. JESSE N. ANDERSON, Conway, Mo. Filed Mar. 20, 1889. Serial No. 303,952. (No model.)

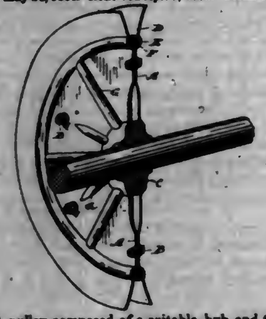


Claim.—1. A saddle-bag provided with a pocket and having a removable folding board consisting of overlapping sections, as *w*, provided with opposite slides *w'*, substantially as specified.

2. In saddle-bags, the pocket having a pivoted box fitting in an opening in its front side, the hooks to limit the outward swing of the box, the covering-flap extending over the upper and front sides of the pockets, and the catch on the free end of the said flap, consisting of a plate which is provided with a perforation to fit over a shoulder-stud on the front side of the swinging box, and the slide mounted on the said plate and provided with a slot to engage the stud, substantially as and for the purpose specified.

3. In saddle-bags, the pocket formed from a single piece of leather, consisting of the back fold B, the bottom fold E, the side folds F F, provided with ears *f f*, which are secured to the bottom fold, the front flaps G G, connected at their free edges, the fold K, which forms the front of a swinging box, and the folds L L and M M, which form the sides and rear of the said box, substantially as specified.

4. The pocket G, herein described, provided with an opening in its front wall, having a pivoted metal-lined pocket mounted therein, and a metal lining mounted in the pocket G, which pocket is longitudinally subdivided and provided with metal compartment-forming transverse partitions, substantially as specified.



405,650. DRAWING PEN AND PENCIL. RUFUS ANDERSON, Ithaca, N. Y. Filed Feb. 8, 1889. Serial No. 299,092. (No model.)

Claim.—1. A spacer for a drawing-pen, consisting of a spring secured to a block, and an adjusting-screw attached to the block and extending through the spring, having an adjusting-nut on its outer end, the said block being slotted to admit of its being inserted under the pen-adjusting nut, substantially as shown and described.

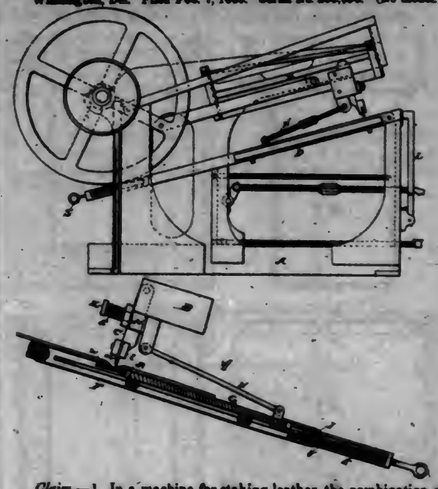
2. The combination, with the adjusting-screw and top bow of a drawing-pen, of a slotted block *d*, a spring *h*, and adjusting-screw *e*, whereby the spring may be adjusted longitudinally and laterally with the points of the pen, substantially as shown and described.

405,651. GROOVED PULLEY. WALTER H. AVIS, York, Ontario, Canada. Filed May 21, 1888. Renewed Apr. 5, 1889. Serial No. 306,146. (No model.)

Claim.—1. A pulley composed of a suitable hub and two metal sheets formed with a peripheral groove, combined with a rubber ring seated in a recess at the bottom of said groove and a core of compressible material in said ring, substantially as described.

2. A pulley provided with a groove formed of two sheets of metal flaring in opposite directions and having a recess in the bottom of the groove and a core of compressible material in said recess, substantially as described.

405,652. MOLD FOR MAKING SEWERS. JOHN RAABE, Waco, Tex. Filed Dec. 14, 1888. Serial No. 293,573. (No model.)

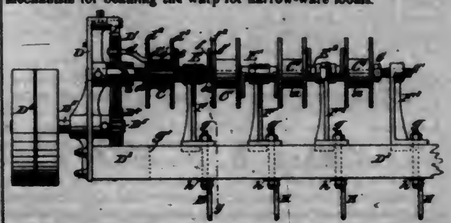


Claim.—1. An expansible and contractible reversible mold for sewers, in form in cross-section of either a semicircle, semi-ellipse, or semi-ovate, formed of segmental or quadrantal portions hinged together and stayed by swinging braces, substantially as described.

2. An expansible and contractible reversible mold for sewers, in form in cross-section of either a semicircle, semi-ellipse, or semi-ovate, formed of segmental portions hinged together and provided with stay-braces and thrusting tie-rods, substantially as described.

3. An expansible and contractible reversible mold for sewers, in form in cross-section of either a semicircle or semi-ovate, formed of segmental portions hinged together and provided with swinging braces and adjustable props, substantially as described.

405,653. LEATHER-DRESSING MACHINE. GEORGE W. BAKER, Wilmington, Del. Filed Feb. 7, 1889. Serial No. 299,096. (No model.)



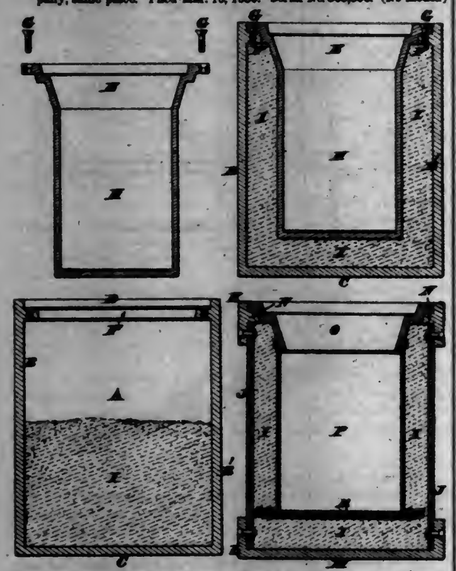
Claim.—1. In a machine for staking leather, the combination of the reciprocating slotted slide, the reciprocating staking-tool carrier having a pivoted spring-controlled knife, and the hard-roller bearing carried by said slide, the working-edge of the knife being arranged in close proximity to said roller-bearing, substantially as set forth.

2. In a machine for staking leather, the combination, with a reciprocating slotted slide, of a hard roller forming the back wall of the slot of said slide, and a tension-governed reciprocating staking-knife having its working-edge in close proximity to the said roller, substantially as specified.

3. In a machine for staking leather, the combination, with a reciprocating slotted slide and with a reciprocating tool-carrier moving in unison therewith, of the pivoted knife-shank, its tension-spring, and the adjustable bearing of said spring, substantially as specified.

405,654. WARP-BEAMING MACHINE. WALTER BAMFORD, Paterson, N. J. Filed Apr. 5, 1889. Serial No. 306,343. (No model.)

Brief.—The invention has for its object to provide an improved mechanism for beaming the warp for narrow-ware looms.



Claim.—1. In a warping attachment, the combination, with driving mechanism, of a number of narrow beams upon which warp to be beamed is delivered, separate shafts in which said beams are loosely journaled, loose connections between said shafts and the beams, whereby motion is transmitted throughout the series, and movable brackets in which said shafts are journaled, substantially as specified.

2. In a warping attachment, the combination, with driving mechanism comprising a gear-wheel provided with an arm, of a number of narrow beams upon which warp to be beamed is delivered and with one of which said arm has a loose connection, separate shafts in which said beams are loosely journaled, loose connections between said shafts and the beams, whereby motion is transmitted throughout the series, and movable brackets in which said shafts are journaled, substantially as specified.

3. In a warping attachment, the combination, with driving mechanism, of a number of narrow beams, separate shafts in which said beams are loosely journaled, loose connections between said shafts and beams, brackets in which said shafts are journaled, a stretcher provided with a longitudinally-extending slot, bolts secured to said brackets and extending through said slots, and cam-levers pivotally connected to said bolts below the stretcher, substantially as and for the purpose specified.

405,655. PROCESS OF MANUFACTURING FIRE-PROOF SAFES.

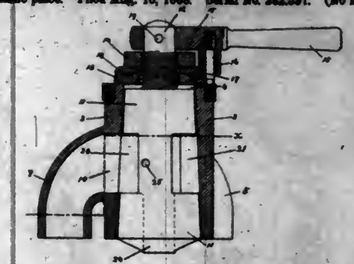
JACOB RAUH, Cincinnati, Ohio, assignor to the Victor Safe and Lock Company, same place. Filed Mar. 16, 1889. Serial No. 303,550. (No model.)

Claim.—1. The within-described process of manufacturing safes, which process consists in charging the outer shell with a plastic fire-proof filling, and then forcing the inner box down into the latter, whereby said filling is gradually displaced and caused to ascend around the sides of said box, so as to enter every corner and crevice of the safe, the surplus material escaping at the joint between the door-frame and its seat within the shell, and said box being secured in place, substantially as herein described.

2. The within-described process of manufacturing safes, which process consists in charging the outer shell with a plastic fire-proof filling, and then forcing the inner box down into the latter, whereby said filling is gradually displaced and caused to ascend around the sides of said box, so as to enter every corner and crevice of the safe, the surplus material escaping at the joint between the door-frame and its seat within the shell, and said box being secured in place by anchoring it in said filling, substantially as herein described.

405,656. GAS-REGULATING BURNER.

ORSON W. BENNETT, Washington, D. C. Filed Oct. 18, 1888. Serial No. 288,426. (No model.)

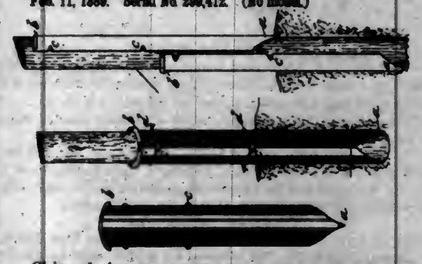


Claim.—1. The combination, with a pillar and a tip adapted to engage therewith, of a regulating-plug having opposing gas-passages leading from its periphery toward its axis and a passage leading from the opposing gas-passages to the end of the plug, the said regulating-plug being independent of the pillar and adjustably attached to the tip, substantially as set forth.

2. The combination, with a pillar and a tip adapted to engage therewith, of a regulating-plug having opposing gas-passages leading from its periphery toward its axis, and a passage leading from the opposing gas-passages to the end of the plug, the said tip being independent of the pillar, and a tubular part connecting the said plug with the tip, substantially as set forth.

3. The combination, with a pillar and a tip adapted to engage therewith, of a regulating-plug having opposing gas-passages leading from its periphery toward its axis, and a passage leading from the opposing gas-passages to the exterior of the plug, the said tip being independent of the pillar, and a tubular part, one end of which fits within the base of the tip and the opposite end of which forms a seat for the said plug, and a cut-off to the entrance of the gas, substantially as set forth.

405,657. LOCOMOTIVE-VALVE FOR AIR-BRAKES.

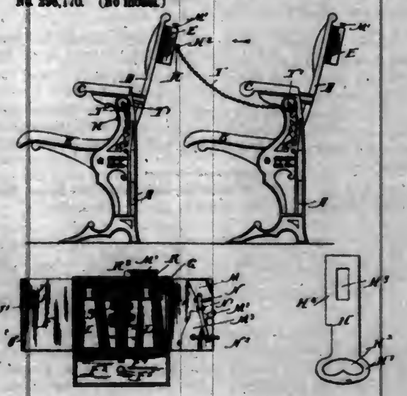


GEORGE A. BOYDEN, Baltimore, Md., assignor to The Boyden Power Brake Company, same place. Filed Aug. 10, 1888. Serial No. 282,397. (No model.)

Claim.—The combination of the casing 3, the ports 8, 9, and 10, communicating with suitable pipes, the plug 11, provided with recesses 20 and 21, the port 25, and the exhaust-port 24, arranged to discharge the air from the plug, substantially as and for the purpose set forth.

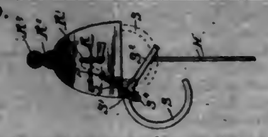
405,658. POLE OR POST PROTECTOR.

MILTON R. CAMPANY, Hamilton, assignor of one-half to Horace B. Peck, Allegan, Mich. Filed Feb. 11, 1889. Serial No. 299,412. (No model.)



Claim.—1. As a pole or post protector, the semi-tubular metallic sheets pointed at one end, and provided with a flange at the other, adapted to be driven into the earth beside a pole or post and act as a protector and support for the same, as shown and described.

2. The pole or post protector consisting of the semi-tubular sheets having their lower ends pointed and turned inward, their upper ends provided with an outwardly-projecting flange, and the projection *c* along their edges to prevent the slipping downward of clamps by which they are secured in place, substantially as set forth.



3. The combination, with the pole or post A, of the semi-tubular metallic protectors B, having flanges *b* and projections *c*, and clamps *d*, surrounding said protectors and retaining them in position, as specified.

405,659. COIN-CONTROLLED OPERA-GLASS CASE.

EDWARD J. COLBY, Chicago, Ill., assignor to Ferdinand Siegel, Joseph S. Baer, and Abraham M. Rothschild, all of same place. Filed Jan. 31, 1889. Serial No. 298,170. (No model.)

405,659.

Claim.—1. The combination of a coin-controlled opera-glass case, a lock on the opera-glass, and a key adapted to unlock the case and to be itself locked to the opera-glass.

2. The combination of a coin-controlled opera-glass case, a lock on the opera-glass, and a key adapted to unlock the case and to be itself locked to the opera-glass, and a chain fastened to the opera-chair and the key.

3. The combination of a coin-controlled case, a removable article therein, and a key adapted to unlock the case and to be itself locked to such article.

4. The combination of a coin-controlled case, a removable article therein, and a key adapted to unlock the case and to be itself locked to such article, and a chain secured at one end and at the other fastened to the key, so that by such key the article is released from the case but secured to the chain.

5. The combination of a coin-controlled opera-glass case, a lock on the opera-glass, and a key adapted to unlock the case and to be itself locked to the opera-glass, and a chain fastened to an opera-chair and the key, said opera-glass case secured to one chair and the chain to the next chair in the rear.

6. The combination of a case, a coin-controlled lock therefor, an article provided with a lock to be contained in such case, and a key adapted to unlock the case and to be at the same time automatically engaged by the lock on the article, so as when the case is opened to leave the key secured to the lock on the article.

7. The combination of a case having a lock, said case being provided with a slotted swiveled portion in the edge of one of its folding doors, and a key adapted to enter such slot and when turned toward the edge of such door to permit said door to open and pass from such slot.

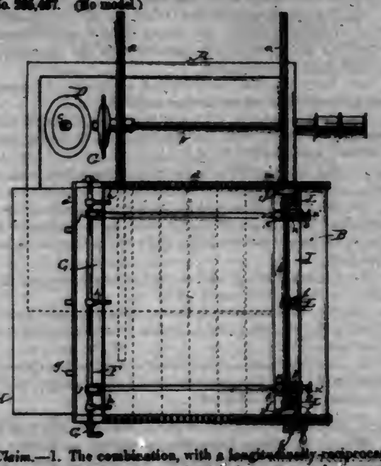
8. The combination of an opera-glass having a spring-lock secured thereto with a case therefor, a coin-controlled lock thereon, and a key and a chain, said key adapted to unlock the case and to be itself engaged while so doing by the spring-lock on the article.

405,660. SIEVE.

JOHN R. CORNWALL, Moline, Ill., assignor to the Barnard & Leas Manufacturing Company, same place. Filed May 9, 1888. Serial No. 273,316. (No model.)

Claim.—The combination of the shoe and the inclined frame having shouldered side bars secured therein with the sieve composed of strips C, arranged in a stepped tier on said bars, overlapping but not touching each other and having their rear edges curved upward and forward and provided with slots in their outer edges having outwardly-diverging sides, all substantially as and for the purpose specified.

405,661. METHOD OF MAKING RAKES.



WARREN H. COWDERY, Ashtabula, Ohio, assignor of one-half to Samuel R. Harris, same place. Filed Mar. 14, 1889. Serial No. 303,270. (No model.)

Claim.—An improvement in the method of making rakes, consisting of the following steps: first, making an angular cut at each end of the blank, said angular cut consisting of the transverse cut *a'*, extending from the lower edge of the blank transversely toward its upper edge, and of the longitudinal cut *b*, extending from the upper end of said transverse cut longitudinally toward the center of the blank, forming the cut end portions *c*, and, second, turning outward said cut end portions *c* and drawing them into tangs, substantially as set forth.

405,662. STEREOTYPER'S SAWING, TRIMMING, AND GROOVING MACHINE.

JOHN R. CUMMINS, New York, N. Y., and GEORGE R. LLOYD, Chicago, Ill. Filed Jan. 3, 1888. Renewed Jan. 4, 1889. Serial No. 295,667. (No model.)

Claim.—1. The combination, with a longitudinally-reciprocating bed, of a combined separating and trimming cutter and a grooving-saw inclined toward said cutter, as set forth.

2. In a stereotyper's sawing, trimming, and grooving machine, the combination of a revolving cutter adapted to saw stereotype-plates and to trim the sides of the kerf so made, and a grooving-saw inclined toward said cutter at a suitable angle, so that the uppermost point of its periphery is removed from said cutter a suitable distance and is on a plane slightly below that of the uppermost part of the periphery of said cutter.

3. The combination, with a longitudinally-reciprocating bed and a laterally-movable longitudinal feed-plate thereon, of a combined separating and trimming cutter and a grooving-saw inclined toward said cutter, as set forth.

4. The combination, with a longitudinally-reciprocating bed having racks secured to its transverse edges, feed-plate I, and shaft *i*, journaled on said plate and having pinions on it meshing with said racks, of a combined separating and trimming cutter and an inclined grooving-saw, as set forth.

5. The combination, in a combined stereotyper's sawing, trimming, and grooving machine, with a longitudinally-reciprocating bed having transverse racks along its front and rear edges, of the feed-plate I, having guide-frames near its ends, shaft *i*, journaled in bearing-blocks movable laterally in said guide-frames and provided with offsets or eccentrics at suitable intervals, and the oscillating bars journaled on said offsets and pivotally connected at their opposite ends to plate I, as described.

6. In a stereotyper's sawing, trimming, and grooving machine, the combination, with the bed and the longitudinal feed-plate thereon, of the transverse adjusting-plates *n n*, having the arms depending from one end thereof, clamp-plates *s s*, and thumb-screws *t t*, as set forth.

7. In a stereotyper's sawing, trimming, and grooving machine, the combination, with the bed having racks on the transverse edge thereof and the feed-plate I thereon, of shaft *i*, journaled on said plate I, and having pinions thereon engaging with said racks, and the adjusting-plates *n n*, clamp-plates *s s*, and thumb-screws *t t*, as set forth.

8. In a stereotyper's sawing, trimming, and grooving machine, the combination, with the bed and the laterally-moving feed-plate I thereon, of the adjusting-plates *n n* and screws *n' n'*, as set forth.

9. In a stereotyper's sawing, trimming, and grooving machine, the combination, with the bed and the laterally-moving feed-plate I thereon, of the adjusting-plate and gage-screws *n' n'*, clamping-plates *o o*, and thumb-screws *t t*, as set forth.

10. In a stereotyper's sawing, trimming, and grooving machine, the combination, with the bed and the laterally-moving feed-plate I thereon, of the rock-shaft G and oscillating presser-plate F, substantially as set forth.

11. In a stereotyper's sawing, trimming, and grooving machine, the combination, with the laterally-movable feed-plate I thereon, of the adjusting-plate and the clamping-plate F, as set forth.

12. In a stereotyper's sawing, trimming, and grooving machine, the combination, with the longitudinally-reciprocating bed, rack *d d*, secured thereto over the lateral edges thereof, and gage-bar *d'*, of the laterally-movable feed-plate I, as set forth.

13. In a stereotyper's sawing, trimming, and grooving machine, the combination, with the longitudinally-reciprocating bed and gage-bar *d'*, of the clamping-plate F and feed-plate I, as set forth.

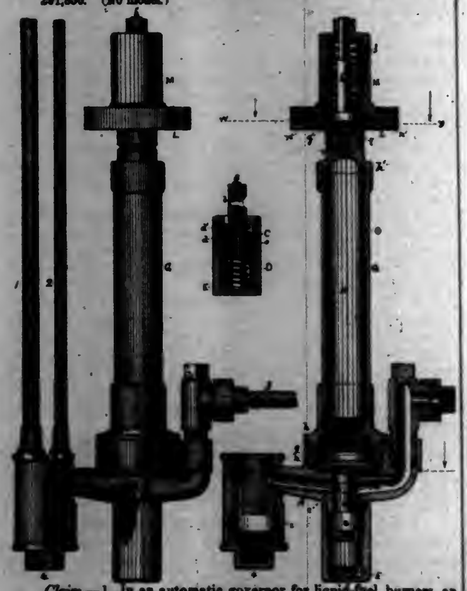
14. In a stereotyper's sawing, trimming, and grooving machine, the combination, with the bed having racks *d* on the lateral edges thereof, the guard-strip *e*, and gage-bar *d'*, of the clamping-plate F and feed-plate I, as specified.

15. The combination, with the bed, of the plate F, rock-shaft G, having eccentrics or offsets thereon, and links *f f*.

16. The combination, with the bed, of the plate F, having its bearing-surface faced with leather, rock-shaft G, having eccentrics or offsets *g g*, and links *f f*.

17. The combination, with the bed, of the plate F, rock-shaft G, links connecting said plate and shaft, and the arms *h h*.

18. The combination, with the bed, the cutters C, and saw D, of the inclined plane H, placed parallel with the side edges of the bed, adjacent to the said cutter and saw and near the front of the machine, as set forth.



19. The combination, with the bed and inclined plane H, as described, of rock-shaft G and the arms *h h*.

20. The combination, with the bed and the inclined plane, as described, of the oscillating clamping-plate F and the tipping-arms *g g*, as set forth.

21. The combination, with the bed and the inclined plane, as described, of the oscillating clamping-plate F, the tipping-arms *g g*, the rock-shaft G, and the arms *h h*.

405,663. AUTOMATIC GOVERNOR FOR LIQUID-FUEL BURNERS.

WILLIAM H. EASTMAN, Boston, Mass., assignor to the Eastman Freight Car Heater Company, Portland, Me. Filed Nov. 26, 1888. Serial No. 291,836. (No model.)

Claim.—1. In an automatic governor for liquid-fuel burners, an unequal expansion pair or combination, an elastic diaphragm, and stiff metallic segments that prevent bulging of the said diaphragm and transmit its pressure in whole or in part to a valve.

2. In an automatic governor for liquid-fuel burners, a hermetically-sealed chamber containing an expansible liquid, and provided at one point with an elastic diaphragm for operating a governing-valve and at another point with an elastic diaphragm for relieving pressure from excessive expansion.

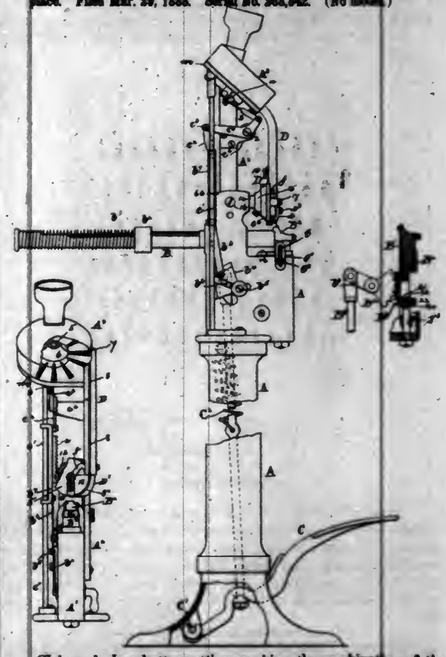
3. In an automatic governor for liquid-fuel burners, a hermetically-sealed chamber containing an expansible liquid, and provided at one point with an elastic diaphragm for operating a governing-valve and at another point with an elastic diaphragm for relieving pressure from excessive expansion, in combination with an indicator which shows that such excessive expansion is operating.

4. In an automatic governor for liquid-fuel burners, a valve operated by an unequal-expansion combination, in combination with an elastic diaphragm and stiff metallic segments which transmit pressure from parts of the said diaphragm remote from the part that is in contact with the valve.

5. In an automatic governor for liquid-fuel burners, the combination of the puppet-indicator, the relief-diaphragm, and the spring *j*.

6. In an automatic governor for liquid-fuel burners, the puppet-indicator *k*, actuated through an elastic diaphragm and supporting-segments by expansion in excess of that required to operate the governing-valve, in combination with said elastic diaphragm and supporting-segments.

7. In an automatic governor for liquid-fuel burners, the combination of a valve operated by expansion in opposition to the pressure of a comparatively weak spring, and a puppet-indicator operated by increase of expansion against the pressure of a stronger spring, in combination with said comparatively weak spring and said stronger spring.



8. The combination of the chamber H and liquid contents, the diaphragm *g'*, supporting-segments *n'*, puppet *k*, and spring *j*.

9. The combination of the valve-case *a*, piston B, adjusting-nuts *d d'*, the spring E, with the diaphragm *g*, and supporting-segments *n*.

10. The combination of the valve-case *a*, piston B, adjusting-nuts *d d'*, spring E, diaphragm *g*, supporting-segments *n*, the chamber H, and its expansible liquid contents, with the diaphragm *g'*, supporting-segments *n'*, the indicating-puppet *k*, and the spring *j*.

405,664. BUTTON-SETTING MACHINE.

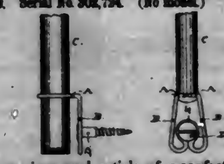
LOZIER C. BERRIDGE, North Grafton, Mass., assignor of one-half to Charles H. Holden, same place. Filed Mar. 29, 1888. Serial No. 268,942. (No model.)

Claim.—1. In a button-setting machine, the combination of the following instrumentalities, viz: a raceway for the buttons, a raceway to guide fasteners, an anvil, a driver, a detent for the buttons in the button-raceway, a button-guideway in extension of the raceway and located between the latter and the anvil, as described, and an independent reciprocating segmental transferer to take the said buttons singly from the raceway to the anvil and driver into position to have a fastener driven through the button-eye, substantially as described.

2. In a button-setting machine, the combination, with a raceway, anvil, and driver, of a circularly-moving reciprocating segmental transferrer and intermediate button-guide, the said transferrer transferring the buttons from the end of the raceway to the driver, substantially as described.

3. The slotted raceway, the anvil, the driver, the button-supporting spring located near the said driver, and the guideway interposed between the button-raceway and the anvil, combined with a circularly-moving reciprocating segmental transferrer adapted to transfer the button from the raceway to the anvil, and to also act as a stop for the endmost button of the column of buttons in the button-raceway, substantially as described.

4. In a button-setting machine, an anvil and a driver, combined with a vertically-movable work-support actuated by the said driver and with a stop to limit the upward movement of the work-support toward the anvil, substantially as described.

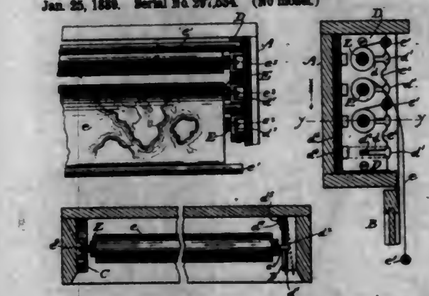


5. In a button-setting machine, a button-receiving hopper, a slotted raceway in connection therewith, an anvil, a slotted button-guideway interposed between the said anvil and raceway, and a work-support and driver, combined with a segmental transferrer to transfer the button from the end of the raceway to the driver, the slots in the raceway and in the guideway being constructed, substantially as described, to enable the eye of the button to be presented toward the operator, in order that the latter may unerringly see whether or not the material and the eye of the button are in proper position to be entered by the prong of the fastener, substantially as described.

6. In a button-setting machine, the hopper, the button-raceway slotted at its front side, and the button-guideway, also slotted at its front side, for the extension through the said slots of the shanks of the buttons, combined with the anvil and driver and with a segmental transferrer to take the buttons from the button-guideway with their shanks toward the operator, in which condition the open eye of the button is readily visible, substantially as described.

7. The button-raceway, the button-guide, the transferrer, its shaft 13, and the driver, combined with the connecting devices between the said rod and driver and between the rod and shaft 13, to actuate the transferrer, substantially as described.

405,665. BLIND-STOP.

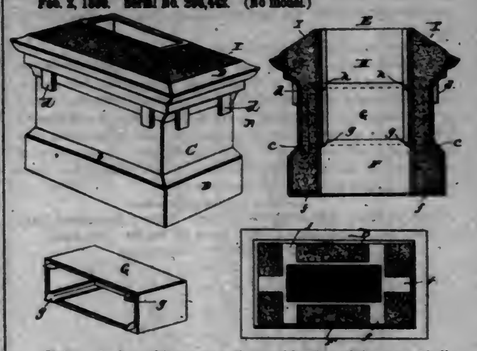


MARQUIS L. HALL, Omaha, Nebr. Filed Feb. 16, 1889. Serial No. 300,734. (No model.)

Claim.—As an improved article of manufacture, a device for holding the connecting bar or rod of the blind-slats, consisting of a single piece of wire bent midway of its length to form an eye and having upwardly-directed branches B, and a horizontally-disposed clamping portion formed from the branches A, which are bent in a curvilinear manner, the whole being adapted to be secured to a window-blind by a screw, substantially as specified.

405,666. MAP-CASE.

GEORGE B. HECKEL and GEORGE JAMES, Chicago, Ill., assignors to Rand, McNally & Company, same place. Filed Jan. 25, 1889. Serial No. 297,534. (No model.)

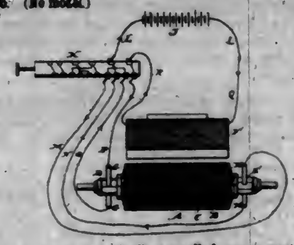


Claim.—1. The combination, with a map-case, of the roll-holding plates C D, having perforations and slots *c d*, respectively, suitable rolls, spindles c^3 c^4, and springs in operative connection with said slots for normally locking said spindles c^3 in place, substantially as shown and described.

2. The combination, with a map-case, of the roll-holding plates C, having perforations *c*, plates D, having slots *d*, and beads d^3, spindles c^3 c^4, and springs c^7, having bent portions d^5, to conform to said beads, substantially as shown and described.

405,667. CHIMNEY-TOP.

MONTGOMERY HINKLEY, Mercer, Pa. Filed Feb. 2, 1888. Serial No. 298,442. (No model.)



Claim.—1. In a chimney-top, the combination of the outer shell, the inner shell projecting above the upper end of the outer shell, and the interposed filling, which forms a wash between the upper ends of the said shells, substantially as specified.

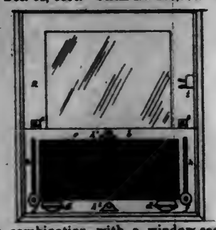
2. In a chimney-top, the combination of the outer shell, consisting of a base, a cap, and intermediate section, the inner shell containing a lower section F, provided with lateral projections *f f*, which bear at their ends against the inner surface of the base, and the intermediate and upper sections G and H, provided with depending points or lugs *g* and *h*, to engage the corners of the next lower section, and the filling interposed between the sides of the said shells, substantially as specified.

3. In a chimney-top, the combination of the inner shell, the outer shell consisting of a base B, adapted to rest on the upper end of the chimney, the intermediate section C, provided with depending points or lugs at its corners to engage the inner corners of the base, and the cap resting on the upper edge of the intermediate section and provided with the outer depending ears, which bear against the sides of the section C, and the interposed filling, substantially as and for the purpose specified.

405,668. ELECTRIC MOTOR OR DYNAMO-ELECTRIC MACHINE.

RUDOLPH M. HUNTER, Philadelphia, Pa. Filed Jan. 23, 1889. Serial No. 297,795. (No model.)

Claim.—1. In an electrically-propelled car, a motor geared to the axle and having field-magnets and a rotating armature-core, in combination with two sets of coils of insulated wire wrapped about said core and substantially uniformly distributed and independently insulated, a commutator at each end of the armature, each having its contact segments connected to alternate coils, two pairs of brushes, one pair for each commutator, a source of electric supply and connecting-circuits between its field-magnets, commutator-brushes and source of electric supply, whereby the field-magnets are permanently in series with the armature and source of electric supply.



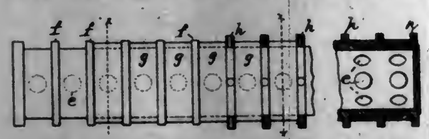
2. The combination of an electrically-propelled vehicle, an electric motor mechanically connected to drive the axle formed of field-magnets and two sets of armature-coils having a commutator for each set of coils, a battery carried by the vehicle, a regulator also carried by the vehicle for coupling up the two sets of armature-coils in series or multiple and maintain them when energized in series with the field-magnets, and separate connecting-circuits between the battery, field-magnets, the two sets of armature-coils, and the regulator.

3. The combination of an electrically-propelled vehicle, and electric motor mechanically connected to drive the axle and formed of

field-magnets and two sets of armature-coils having a commutator for each set of coils, a battery carried by the vehicle, having its cells connected in series, a regulator also carried by the vehicle for coupling up the two sets of armature-coils in series or multiple and maintain them in series with the field-magnets, and separate connecting-circuits between the battery, field-magnets, the two sets of armature-coils, and the regulator, whereby the battery-cells are always in series with the motor.

4. An electrically-propelled vehicle having an electric motor mechanically connected to its axle and formed of field-magnets, two sets of armature-coils in one structure and in which the field-magnet coils are in series with the armature-coils, a commutator for each set of coils, and a pair of brushes for each commutator, in combination with a source of electric supply, separate circuits for connecting the field-magnet coils and each set of armature-coils with the source of electric supply, and a regulator to couple the armature-coils in series or multiple with the source of electric supply.

405,669. CAR-WINDOW SCREEN. EMILY S. HUTCHINSON, Peekskill, N. Y. Filed Dec. 11, 1888. Serial No. 293,308. (No model.)

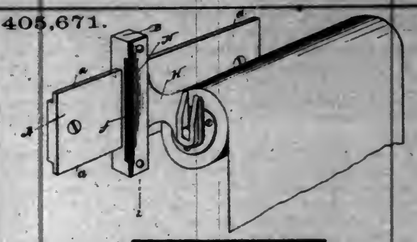


Claim.—1. The combination, with a window-sash, of a sliding screen attached thereto by means of guiding-studs placed on the lower part of the window-sash and operating in slots provided in the screen-frame, substantially as described, the handles for raising the window placed on the screen-frame, whereby the sash and screen are raised together, the screen, when released by the hands, dropping below the sash, substantially as herein described.

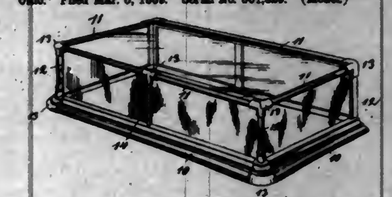
2. In a window-screen, the combination, with the window-sash, of a screen-frame attached to the sash by means of guiding-studs on the lower part of the sash, projecting through slots provided in the screen-frame, the studs having knobs on their outer ends to keep the screen against the sash, the handles for raising the window placed on the screen-frame, and the window-sash being provided with stops to limit the upward movement of the screen, substantially as herein shown and described.

3. In combination with a sliding screen attached to a window-sash, substantially as described, stops *c*, located on the window-sash the height of the screen above the bottom of the window-sash, the stops having beveled overhanging lips, substantially as shown, for the purpose of securing the screen-frame from rattling when both sash and screen are lowered.

405,670. CHECK-VALVE FOR FILTER CONSTRUCTIONS. JOHN W. HYATT, Newark, N. J., assignor to The Hyatt Pure Water Company, of New Jersey. Filed Feb. 23, 1888. Serial No. 265,558. (No model.)



Claim.—The combination, with a filter containing loose granular material, of an inlet-pipe buried in such granular material and provided at intervals with rows of holes extending transversely around the pipe, and a separate rubber band of suitable width to cover a single row of holes applied over each row and arranged to yield freely at the opposite sides of such holes to form a passage for the fluid at both edges of the band, the whole arranged and operated as and for the purpose set forth.



405,671. CURTAIN-POLE-SUPPORTING FIXTURE. THOMAS H. KELLEY, Salem, Mass. Filed July 10, 1888. Serial No. 279,568. (No model.)

Claim.—A support for a curtain-fixture, consisting of a fixed supporting-bar A, a block B, adjustably supported thereon, a recess in said block covered by a spring-plate, and a supporting-bracket H, having a flange fitting the recess in the block and detachably held by the spring-plate, substantially as described.

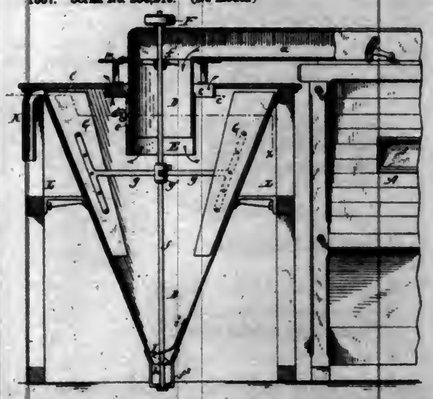
405,671.

405,672. JOINT FOR SHOW-CASES. HENRY KRUSE, Cincinnati, Ohio. Filed Mar. 5, 1889. Serial No. 301,829. (Model.)

Claim.—1. In combination with a show-case, the metallic socket-joints 13, wooden parts provided with metallic foundations 15, entering said sockets and the former soldered to the latter, as shown and described.

2. In a show-case, the combination of the angle-iron 17, connecting two rails, the metallic corner socket-joint 13, connected to angle-iron 17, and the third rail or post soldered to the corner socket-joint, as shown and explained.

405,673. TENSION-REGULATING DEVICE FOR LOOM-SHUTTLES. MATHIAS MERCIER, Biddeford, Me., assignor to Harold Kelly, same place, and John P. Kelly, Saco, Me. Filed Jan. 12, 1889. Serial No. 296,150. (No model.)



Brief.—The object of the invention is to secure uniform tension and to permit automatic threading of the tension device.

Claim.—1. The combination, with a shuttle-body, of a tension-weight pivoted at one end within the shuttle-body, and having its free end beveled, substantially as set forth.

2. The combination, with a shuttle-body, of a tension-weight having one end free and beveled and the other loosely held in a case, and said case attached to the shuttle-body, substantially as set forth.

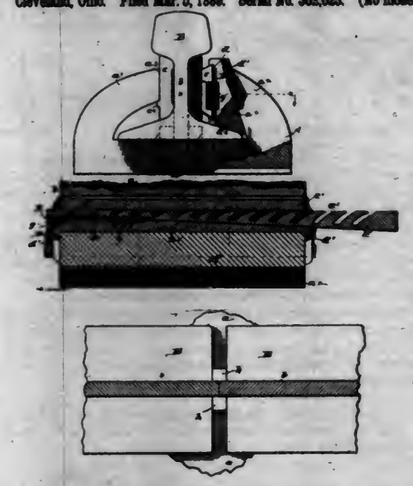
405,674. DUST-COLLECTOR. ORVILLE M. MOSER, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed Nov. 26, 1887. Serial No. 256,219. (No model.)

Claim.—1. The combination, with the separating-chamber having an imperforate peripheral wall, an outlet for the purified air located inwardly from the peripheral wall, and a dust-outlet, of an inlet-pipe for the dust-laden air entering the separating-chamber at or

near its axis, a rotating fan arranged within said chamber, whereby the dust-laden air is caused to whirl therein and the dust is massed against the imperforate peripheral wall, while the purified air moves toward the axis of the separating-chamber, and power mechanism whereby the fan is rotated, substantially as set forth.

2. The combination, with a tapering separating-chamber having an imperforate peripheral wall, a dust-discharge opening at its small end, and an outlet for the purified air, of an air-inlet pipe entering said chamber centrally, a rotating fan arranged within said chamber, and power mechanism whereby the fan is rotated, substantially as set forth.

3. The combination, with the separating-chamber having an imperforate peripheral wall, a dust-discharge opening at its end, and a central air-escape opening, of an air-inlet pipe entering the separating-chamber through said air-escape opening and made of smaller size than said opening, substantially as set forth.



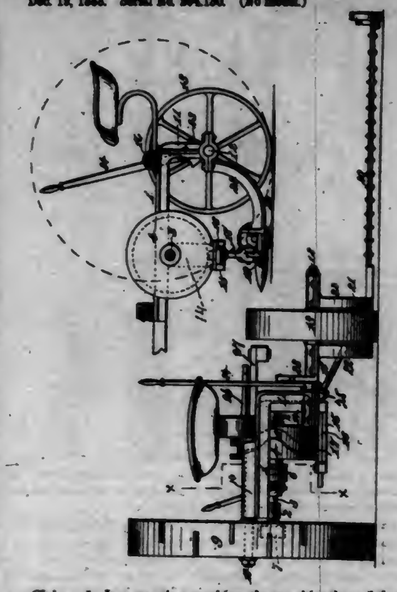
4. The combination, with the tapering separating-chamber provided with a dust-discharge opening at its small end and an air-escape opening at its large end, of an air-inlet pipe entering the separating-chamber through said air-escape opening and made of smaller size than said opening, substantially as set forth.

5. The combination, with the separating-chamber having an imperforate peripheral wall and a dust-discharge opening and an air-outlet at its end, of a lengthwise-adjustable air-inlet pipe entering said case centrally, a fan arranged within said case, and power mechanism whereby the fan is rotated, substantially as set forth.

6. The combination, with the tapering separating-chamber having an imperforate peripheral wall, a discharge-opening for the light particles at its small end, a discharge-opening for the heavy particles at its large end, and an air-outlet at its end, of an air-inlet pipe entering said case centrally, a fan arranged within said case, and power mechanism whereby the fan is rotated, substantially as set forth.

7. The combination, with the separating-case having an imperforate peripheral wall, a dust-discharge opening at its end, a central air-outlet, and a power-fan arranged within the separating-case, of a central air-inlet pipe entering the separating-case through the air-outlet opening, and a deflector arranged around the air-inlet pipe opposite the air-outlet opening, substantially as set forth.

405,675. JOINT FOR RAILWAY-RAILS. OBERLIN L. OLDS, Cleveland, Ohio. Filed Mar. 5, 1889. Serial No. 302,063. (No model.)



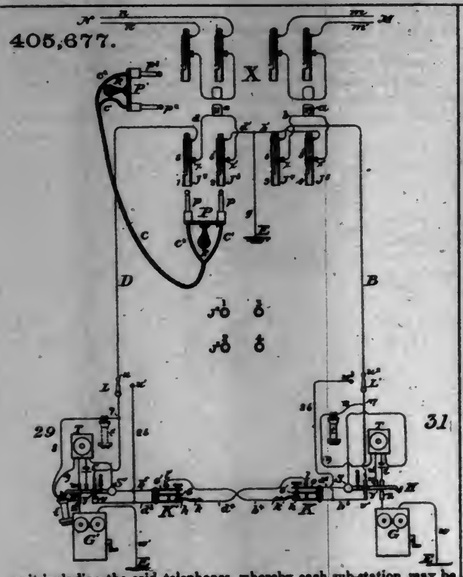
Claim.—1. In a rail-joint, a chair having a laterally-inclined face opposite the web of the rail, in combination with a longitudinally-tapered gib adapted to said inclined face on one side and its opposite face parallel in vertical lines to the web of the rail with a wedge and fish-bars, substantially as set forth.

2. In a rail-joint, a gib wedge-shaped longitudinally and having a longitudinal groove on its inner side and its outer side inclined outwardly from its top to its bottom edge, in combination with a chair correspondingly inclined to the gib, and a wedge and fish-bar, substantially as set forth.

3. In a rail-joint, a chair with one vertical and one inclined side, and a rail, in combination with a gib having an inclined side resting against the side of the chair and its lower edge bearing on the rail, the said gib tapered and grooved longitudinally, and a wedge set in said groove and bearing against the fish-bar, substantially as set forth.

405,676. MOWER. JOHN A. PEER, Brooklyn, assignor, by direct and mesne assignments, to Richard K. Owens, James Owens, and Theodore W. Bryant, New York, Alfred G. Ely, Owego, and Charles C. Ely and Frederick Ely, New York, N. Y. Filed Sept. 5, 1887. Renewed Dec. 19, 1888. Serial No. 294,120. (No model.)

Claim.—1. In a mowing-machine, the combination of the frame 1, having short axles 10 and 12 at different heights, the drive-wheel 9, mounted on the upper short axle 10, a cam 4, actuated from said drive-wheel, the small traveling wheel 13, mounted on the lower short axle 12, the adjustable bifurcated shoe 22, sleeved and wholly supported on the axle 12 on both sides of the traveling wheel, a cutting apparatus horizontally hinged to the lower front portion of the shoe, the pitman 18, for actuating the cutting apparatus, and the slide-bar 16, connected to the pitman by a ball-and-socket joint 25, and having a roller 17, engaged with the cam 4, substantially as described.



2. The herein-described mowing-machine, consisting of the frame 1, having axles 10 and 12 at different heights, the cam-shaft 3, having a loose cam 4, clutch mechanism 6, and pinion 7, the drive-wheel 9, having gear 8, the small traveling wheel 13, the adjustable bifurcated shoe 22, sleeved and wholly supported on the axle of the small traveling wheel, the finger-bar 20, horizontally hinged to the lower front portion of the shoe, the reciprocating cutter-bar 19, located in line with the cam-shaft, the pitman 18, the slide-bar 16, connected to the pitman and located in line with the cam-shaft beneath the center of the cam and having a roller 17 engaged with said cam, and the bracket 14 and guide-bar 15 for supporting said slide-bar, substantially as described.

405,677. TELEPHONE COMBINATION-CIRCUIT. FRANK A. PICKERNELL, East Orange, N. J., assignor to the American Telephone and Telegraph Company, New York, N. Y. Filed Mar. 13, 1888. Serial No. 303,063. (No model.)

Claim.—1. In a telephone-exchange system, two single-line or earth-return circuits, each extending from a central to a sub station and each normally grounded through signaling apparatus at its own sub-station, combined with automatic switches at each sub-station controlling the earth terminals of both lines and operated by the removal and replacement of the receiving-telephones, whereby when the said receiving-telephone at either sub-station is removed from its position of rest it is connected in a metallic circuit formed of the said two lines, and whereby the normal earth terminals of both lines are automatically disconnected by the operation of the switch at either station.

2. In a telephone-exchange system, the combination, substantially as hereinbefore described, of two single-line or earth-return main circuits, each extending from a central station to an earth terminal at an independent sub-station, and signal sending and receiving appliances at each sub-station included in said circuit, with telephones at each sub-station, and means also at each sub-station for disconnecting the earth terminals and signaling appliances of both circuits, and for automatically uniting the said two single lines to establish a metallic cir-

405,677.

cuit including the said telephones, whereby each sub-station may be provided with an individual ringing-line, and with an exclusive metallic talking-circuit, for the purposes specified.

3. In a telephone system, two single-line or earth-return circuits, each extending from a central station to a sub-station, where it normally terminates in the earth, each line constituting a distinct and independent signaling-circuit, automatic devices at each sub-station operated by the removal and replacement of the telephone, whereby the said two distinct lines may be united through the telephones of said sub-station in metallic circuit, and spring-jacks at the central station arranged in pairs, as shown and described herein, the terminals of both lines at said central station being in close proximity to each other, whereby both terminals may by the same movement be connected with the terminals of any other line, substantially as described.

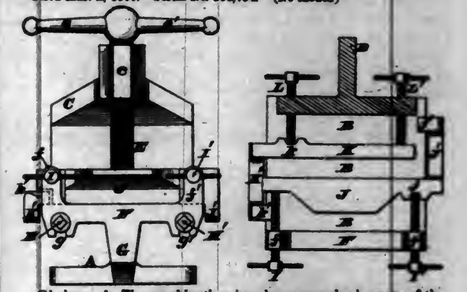
4. The combination, substantially as hereinbefore described, of two single-line or earth-return circuits, each extending from a central station to its own sub-station, and there normally grounded after passing through signaling devices, but each passing first through a circuit-breaker or movable contact controlled by the automatic switch of the other sub-station, for the purposes specified.

5. In a telephone-exchange system, the combination of two lines, each extending from a central station through the sub-station of the other to a normal earth terminal at its own sub-station, a normally-open branch circuit at each sub-station, including the telephones of the said sub-station, the said branch being in permanent connection at one end with the line of the other sub-station, as described, and automatically-operated means at each station for disconnecting the earth terminals of both lines, and for connecting the disconnected terminal of its own line with the normally-open end of the telephone branch, whereby a metallic circuit including the telephone is established, substantially as hereinbefore described.

6. In combination with two telephone-lines, each extending, as described herein, through the station of the other to earth at its own station, signaling appliances and telephones at each sub-station, and an automatic telephone-switch at each sub-station adapted to transfer the main line of said station from its signaling-instruments to the telephones, and vice versa, and to disconnect the earth terminals of both lines, of circuit-changing keys or switches at each station controlling contacts in both lines, as described, whereby the said two sub-stations are enabled to signal and converse with each other without the intermediation of the central station, substantially as specified.

405,678. CABINET FOR PRESERVING AND DISPLAYING GAME. EBENEZER L. RAND, Worcester, Mass., assignor of one-half to Charles K. Reed, same place. Filed Jan. 5, 1889. Serial No. 295,512. (No model.)

Claim.—1. The herein-described cabinet, consisting of a glass made with a concave-convex projection or bulge and a flange and a back, between which and the inner surface of the bulge are arranged specimens of the taxidermist's art, and a frame inclosing the glass and back, substantially as described.

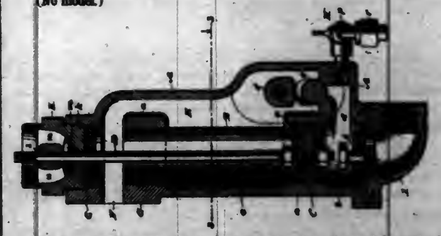


2. The combination of the glass made with a concave-convex

405,678

projection or bulge provided with a flange and a frame and a back, substantially as shown and set forth.

405,679. HARNESS-MAKER'S PRESS. SILAS H. RANDALL, Wyoming, Ohio, assignor of one-half to James D. Randall, same place. Filed Mar. 2, 1889. Serial No. 301,754. (No model.)



Claim.—1. The combination, in a harness-maker's press, of the main screw E, adjusting-screws I I', bed-plate B, and a jaw J, sliding upon it, which jaw has a lateral extension J' below the upper surface of said plate and a lip bearing against it, as herein described, and for the purpose stated.

2. The combination, in a harness-maker's press, of the jaw J and its adjusting-screws I I', one of which, as I', bears within the vertical groove *j* of said jaw, while the other screw I bears against an ungrooved surface of the jaw, for the purpose described.

3. The combination, in a harness-maker's press, of the bed-plate B, jaw J, sliding upon it, and fastened to said bed-plate the detachable plate F, having upwardly-projecting lugs *f f'*, to admit the adjusting-screws I I', that operate said jaw, as herein described, and for the purpose set forth.

405,680. PUMP. THOMAS J. RIDER, New York, N. Y., assignor to C. H. De Lamater, same place. Filed Dec. 15, 1888. Serial No. 293,726. (No model.)

Claim.—1. The combination of a body-piece formed in a single casting and provided with a chamber to receive a barrel and with a collar at each end of the chamber to support the barrel, the collar

being integral with the body-piece, and with a discharge-passage on one side connecting the two ends of the chamber and with a discharge-opening at its upper end, a separate barrel fitted and supported in the collars, a valveless piston, a piston-rod passing through the head of the pump, a suction-valve opening into the lower end of the body-piece, and a discharge-valve in the discharge-passage, substantially as shown and described.

2. The combination of a body-piece formed in a single casting, a separate cylinder in said body-piece, a valveless piston working in the cylinder, a piston-rod passing through a stuffing-box, a bottom section secured to the lower end of the body-piece, a suction-valve seated on the bottom section, a discharge-passage in one side of the body-piece connecting the two ends of the body-piece, a discharge-valve in the discharge-passage, a discharge-opening at the upper end of the body-piece, an air-cock connected with the lower end of the body-piece, and a second cock provided with an inlet check-valve at its outer end and connected with the lower end of the body-piece between the suction and discharge valves of the pump, substantially as shown and described.

3. In a pump, an air-cock provided with an inlet check-valve at its outer end and connected with the cylinder of the pump below the discharge-valve, substantially as shown and described.

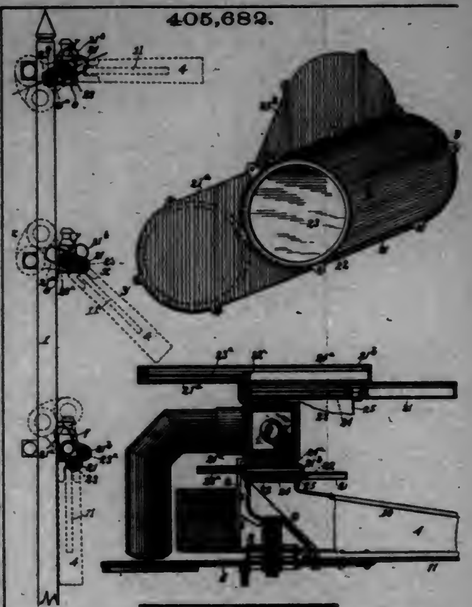
4. The combination of a body-piece formed in a single casting, a separate barrel supported in the body-piece, a valveless piston working in the barrel, a piston-rod, a bonnet in the top of the body-piece composed of a stuffing-box and an extra guide for the piston-rod, and an oil-receiver between the stuffing-box and the guide, a bottom section secured to the lower end of the body-piece, a suction-valve seated on the bottom section, a suction-valve chamber in the lower end of the body-piece, a discharge-passage in one side of the body-piece opening into the upper end of the barrel, a port connecting the lower end of the discharge-passage with the suction-valve chamber, a rolling cylindric valve at the opening between the discharge-passage and the port, an air-cock connected with the port, a second air-cock also connected with the port and provided with an inlet check-valve at its outer end, a discharge-opening at the upper end of the body-piece on the side opposite the discharge-passage, and a flange around the discharge-opening for attachment to the engine, all substantially as shown and described.

405,681. NAIL, BOLT, &c. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Nov. 9, 1888. Serial No. 290,375. (No model.)

Claim.—1. As an improved article of manufacture, the nail, bolt, or other headed blank hereinbefore described, having two or more narrow grooves formed in the surface of the under side of the headed portion, said grooves commencing at or near the junction of the shank and head and extending longitudinally therefrom substantially in line with the shank and terminating at the edge or periphery of the head, substantially as set forth.

2. The headed nail or blank hereinbefore described, having the surface of the under side of the head provided with a series of longitudinally-arranged grooves, the bottoms of which form a continuation of the shank's surface and terminate in well-rounded curves, substantially as set forth.

3. The improved nail or blank *a* hereinbefore described, having a series of grooves *c*, rectangular in cross-section, formed in the surface of the under side of the head *h* and terminating at the edge or periphery of the head, substantially as shown and set forth.



405,682. SEMAPHORE-SIGNAL. JOHN G. BURKHOLDER, Pittsburg, Pa., assignor to George Westinghouse, Jr., same place. Filed Dec. 13, 1888. Serial No. 293,404. (No model.)

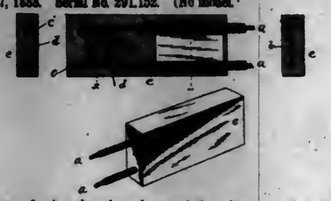
Claim.—1. In a semaphore-signal, the combination of a swinging blade, a lamp for illuminating said blade, and a disk formed of translucent material movable into and out of the path of the rays of light from the lamp in accordance with the changes of position of said blades, substantially as set forth.

2. In a semaphore-signal, the combination of a swinging blade, a lamp for illuminating said blade, a tube or case moving with the blade and arranged at an angle thereto, and a disk of translucent material mounted in the tube or case, substantially as set forth.

3. In a semaphore-signal, the combination of a swinging blade, a lamp for illuminating said blade, a straight tube or case arranged at an angle to the blade, an angular tube or case arranged in proper relation to the blade, and colored disks of translucent material mounted in said tubes, substantially as set forth.

405,682.

405,683. MACHINE FOR MIXING BEVERAGES. FRANKE H. SHEPHERD and JOHN W. MEYER, Davenport, Iowa. Filed Apr. 11, 1888. Serial No. 270,358. (No model.)



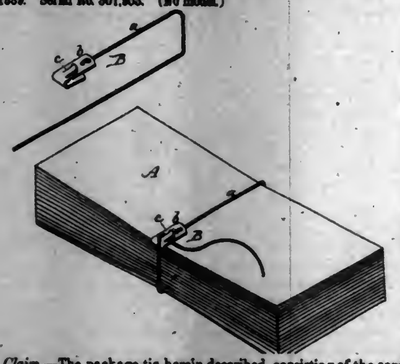
Claim.—1. The combination of the cup-support having the threaded central tube, the rotating rod having its lower end engaging the threads of said tube and provided with a rigidly-fastened crank-handle, and the cross-head mounted loosely on the rotating rod below the crank-handle, as set forth.

2. In a drink-mixer, the combination of the bifurcated standard A, the standard B, having its upper end secured at an intermediate point of the standard A, an open space being left between the standards A and B, the cross-bar I, near the lower end and connecting the legs of the standard A, the hanger secured to said cross-bar, the shaft L, mounted in said cross-bar and hanger, the pulley K on said shaft, the drive-wheel at the upper end of the standard A, the belt T, connecting said drive-wheel and pulley K, the crank-wheel on said shaft L, the guides W on the side of the standard A, the reciprocating rod V, working in said guides and carrying the glass-support-

ing devices on its upper end, and the pitman passing through the space between the standards A B and having its upper end connected to the reciprocating rod, as set forth.

405,684. ELECTRIC PRIMER. HENRY J. SMITH, Pompton, N. J., and EDMUND L. ZALINSKI, U. S. Army. Filed Nov. 4, 1887. Renewed Nov. 17, 1888. Serial No. 291,152. (No model.)

Claim.—1. An electric primer of the character described, in which the bridge is inclosed in and rigidly supported by a cake of compressed powder.



2. The combination, in an electric primer, of the terminals of two insulated wires, a bridge connecting the two, a supporting-clamp for the wires, and a cake of compressed powder inclosing the bridge and clamp.

3. The combination, in an electric primer, of two insulated wires, a platinum bridge connecting the wires, a film of easily-ignited material in contact with the bridge, and a cake of compressed powder inclosing the whole.

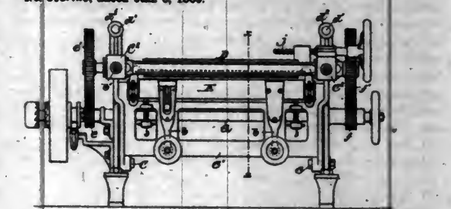
4. The combination, in an electric primer, of the electric wires, a platinum bridge connecting the same, a cake of compressed powder inclosing the wires and bridge, and a film of varnish covering the powder-cake.

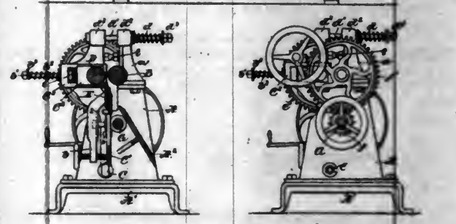
5. The combination, in an electric primer, of the electric wires, a platinum bridge connecting said wires, a cake of compressed powder supporting said bridge, and combustible ferrules surrounding said powder, as set forth.

405,685. PACKAGE-FASTENER. CHARLES F. SPENCER, Rochester, N. Y., assignor to HENRY S. HANFORD, same place. Filed Mar. 5, 1889. Serial No. 301,903. (No model.)

Claim.—The package-tie herein described, consisting of the cord a and hook b, the hook provided with a tongue turned out from its body and standing away from the bend and in the direction of the shank, said hook arranged to catch the papers and the tongue to catch and hold the return end of the cord, as shown and described, and for the purpose specified.

405,686. ROPE-CLAMP. ADAM VOLK, Lockport, N. Y., assignor of one-half to Uriah Lerch, same place. Filed May 14, 1888. Serial No. 273,334. (No model.)





Claim.—1. A rope-clamp consisting of a sectional head having an eccentric groove or grooves and a handle or handles having each a collar, substantially as set forth.

2. A rope-clamp consisting of a sectional head having eccentric grooves, handles having collars formed with eccentric openings, and attaching-lugs on the head, substantially as set forth.

REISSUES.

11,008. LEATHER-SPLITTING MACHINE. FRANK F. STANLEY, Swampscott, Mass. Filed Apr. 10, 1889. Serial No. 306,734. Original No. 396,759, dated Jan. 8, 1889.

Claim.—1. In a leather-splitting machine, the combination, with the positively-rotated feed or pressure roll B, of the movable yoke or frame and the knife, and the gage-roll carried thereby and made movable in unison toward and from the said feed or pressure roll, substantially as described.

2. In a leather-splitting machine, the pivoted yoke or frame C, the knife carried thereby, the gage-roll mounted in movable boxes sustained in the said yoke, and wedge-bar to adjust the said boxes, combined with the feed-roll having rigid bearings, and rods *d*, and springs, as *d*, to enable the said yoke and the parts carried by it to yield toward and from the said feed-roll, substantially as described.

3. In a leather-splitting machine, the combination, with the feed or pressure roll B, of the movable yoke or frame, and the knife, and the gage-roll carried thereby and made movable in unison toward and from the said feed or pressure roll, and with the stop-screws, substantially as described.

PHOTO-LITH. NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

GREEN *v.* HALL *v.* SIEMENS *v.* FIELD.

Decided June 10, 1889.

1. Manifest error in law, being ground for new trial, is also ground for a rehearing under Rule 144.
2. In the decision complained of (46 O. G., 1515) it was held that a working model designed and intended as such is not a reduction to practice, *held* no error. A model or drawing, although a sufficient foundation for a claim to priority, as was held in *Loom Co.* v. *Higgins*, must be followed up with reasonable diligence in order to establish full title to priority.
3. Where it was alleged as error that the Commissioner erroneously decided that one of the parties did not intend at the time he constructed the apparatus upon which his claim to priority was based to use it practically upon an electric railway, and it appeared that the Commissioner did not decide what was the ultimate intention of such party with reference to his invention, but simply decided that certain models were designed and intended as models, *held* no error.
4. Where it was alleged as error that the Commissioner held that priority of invention was to be determined by the intent of the inventor as to the use to which his apparatus should be put, and it appeared that the actual finding of the Commissioner upon that subject was limited to the intent with which certain models were made and used, *held* no error.
5. The allegation that the fact of an application being put in interference determines that the invention has been reduced to practice, overruled. The Office possesses no machinery for ascertaining such fact, but assumes for the purposes of the interference that the invention of each applicant is within the issue, although the subsequent history of the rival inventions may develop the fact that while one of them is in a form capable of commercial use the other may be incapable of any practical use whatever.

MOTION for rehearing.

ELECTRIC RAILWAYS.

Application of George F. Green filed May 15, 1886, No. 202,287. Application of Thomas Hall filed July 22, 1885, No. 172,325. Application of Ernst W. Siemens filed October 25, 1884, No. 146,473. Application of Stephen D. Field filed March 10, 1880, No. 4,752.

Mr. Benjamin Butterworth for Green.

Mr. E. N. Dickerson and *Messrs. Foster & Freeman* for Hall.

Mr. C. S. Whitman for Siemens.

Mr. F. L. Pope, *Mr. F. W. Whitridge*, and *Messrs. Marble & Mason* for Field.

MITCHELL, *Commissioner:*

This case was originally decided by my predecessor. (46 O. G., 1515.) Motions for rehearing on behalf of Green and Siemens were heard by him and denied. The present motion is filed by Hall, alleging certain errors of law and fact, and prays for a rehearing on his behalf.

In a recent case it was decided that the Commissioner of Patents has jurisdiction to reconsider his predecessor's decision in a proper case, and that such cases were not limited to fraud, miscalculation, and newly-discovered evidence, or, in other words, that Rule 144, authorizing reconsideration upon the principles governing new trials, is a lawful rule. (*Daniels* v. *Morgan*, 47 O. G., 811.)

It is now claimed on behalf of Hall that palpable errors entered into the original decision, and that the correction of those errors would result in a reversal of the decree awarding priority to Field.

That rehearings may be granted for manifest errors of law is unquestionable, and that such rehearings are within the principles governing the granting of new trials is equally clear. Perhaps as satisfactory a statement of the law upon that subject as can be found is contained in the case of *The Giant Powder Co.* v. *The California Vigorite Powder Co.*, (6 Sawyer, 508,) where Mr. Justice FIELD says, (p. 531:)

Rehearings are then granted, except when the judge acts of his own motion, only upon such grounds as would authorize a new trial in an action at law—that is, for newly-discovered evidence or errors of law apparent upon the record.

If there is a better statement I think it is to be found in the decision of my predecessor in the case of *Atha* v. *Wheeler*, (MS. Dec., vol. 34, 188,) declaring that—

A new trial will not be granted, except where the verdict is unsupported by evidence, or is manifestly the result of prejudice, bias, or passion, or where, the facts being conceded, there has been a clear error or mistake in the application of the rules of law to them.

Before considering the special errors alleged it is desirable to ascertain definitely what was decided by my predecessor as to the invention of Hall. Field's application was filed March 10, 1880; the application of Hall was filed July 22, 1885, or more than five years afterward. Hall's claim to a patent was wholly based upon what he did a full generation prior to the date of his application in connection with certain working models, with reference to which my predecessor found as matter of fact that they were in design and purpose illustrative like drawings, and were intended to exemplify his theories and not to carry them into effect.

The following passage contains substantially all of the former opinion which need be considered in determining whether the present motion should be granted:

In reference to the various models it must be said that they were not reductions to practice in any proper sense of that expression. It is not merely a question of size, as counsel for Hall ingeniously put it, but a question of design and purpose. Hall's models were illustrative, like drawings. They were intended to exemplify his theories and not carry them into effect. It is alleged by counsel for Hall that these models could be made practically useful for carrying parcels, letters, and the like, and were of a size sufficient to be used upon a railway in a cash-carrier system; but the point is that there is not sufficient evidence that they were intended at the time they were constructed to accom-

plish these ends. The purposes for which they were sold and the uses to which they were put with Hall's knowledge are not such as would carry out his counsel's theory. Philosophical laboratories and learned professors rather than commercial houses and business men received and employed them. It is well-settled law that a working model, designed and intended as such, is not a reduction to practice. Hall's devices manifestly were mere working models and nothing more. After more than a score of years had passed the efforts of others called to Hall's mind his former experience, and he then concluded to file his application and claim the invention as his own.

The principal ground of error alleges that it is not law that a working model may not anticipate a patent.

On inspection of the decision it will be found that the only language to which this allegation of error can apply is the statement that—

it is well-settled law that a working model designed and intended as such is not a reduction to practice.

Is it, then, error to hold that a working model designed and intended as such is not a reduction to practice? In support of the affirmative of this proposition is cited the language of the Supreme Court in *Loom Co.* v. *Higgins*, (105 U. S., 580:)

An invention relating to machinery may be exhibited either in a drawing or in a model, so as to lay the foundation of a claim to priority, if it be sufficiently plain to enable those skilled in the art to understand it. (Page 594.)

It is to be observed, however, that Commissioner Hall did not hold that a drawing or a model might not "lay the *foundation* of a claim to priority," and it is quite clear that the foundation to such a claim might be established by a model which would not in and of itself constitute a reduction to practice. A drawing illustrative of an invention may lay the foundation of a claim to priority; but no decision has ever held that a drawing constitutes reduction to practice. So, too, a model "designed and intended as such" (I quote Commissioner Hall's exact language) may lay the foundation for a claim of priority; but I am unaware of any decision which has ever held that such a model constitutes reduction to practice. Indeed, it will be noted that in *Loom Co.* v. *Higgins*, *supra*, the Court classed a drawing and model together in stating what effect they would have as proof, and the inference that the Court intended to hold that a model is reduction to practice would be no more legitimate than would be the imputation to it of a purpose to say that a drawing constitutes reduction to practice. This view is not without warrant in judicial decisions, for in *Odell et al.* v. *Stout*, (29 O. G., 862,) in which the passage from *Loom Co.* v. *Higgins* was cited, it was expressly held that a model or drawing, although a sufficient *foundation* for a claim to priority, must be followed up with reasonable diligence in order to establish full title to priority.

It is unquestionably true, as claimed by counsel for Hall, that mere enlargement of a machine or device does not constitute invention. (*Phillips* v. *Page*, 24 How., 164; *Planing Machine Co.* v. *Keith*, 101 U. S., 490.) But I find no indication in the decision complained of that any other view of the law was taken upon this point. On the contrary, the Commissioner says:

It is not merely a question of size, as counsel for Hall ingeniously put it, but a question of design and purpose. Hall's models were illustrative, like drawings.

The implication here is quite strong that if the proof had been looked upon as establishing the reduction to practice of the matter in issue, even on a scale adapted to a cash-carrier system, it would have been regarded as establishing priority on the part of Hall. I find nothing in the opinion which indicates that my predecessor entertained the view that patentability can reside in the mere enlargement of a machine. He held that as matter of fact the diminutive exhibits of Hall were simply working models, intended and designed as working models only; and that as matter of law such working models, so intended and designed, do not constitute reduction to practice. If there be error in any part of the decision, there certainly is no error in holding that a working model, designed and intended as such, is not reduction to practice.

Again, it is alleged that Commissioner Hall erred in that he decided, in effect—

That said Hall did not intend at the time he constructed his apparatus, the subject-matter of the present interference, that it should be employed practically on electric railways, whereas the proof is to the effect that the said Hall intended so to employ his invention.

I have examined the decision carefully, and I am unable to find any statements warranting this allegation of error. The Commissioner did not decide what was Hall's ultimate intention with reference to his invention; he simply decided that certain models were designed and intended as models. The intention to use the models for illustrative purposes, "like drawings," and for no other purpose, is entirely consistent with the intention ultimately to construct a railway upon the same principle, if it should be found capable of practical application upon trial, upon a commercial scale of operations. All that is decided with reference to intent relates to the present intention to use the models as models, and not to the ultimate intention which Hall had in mind and which he used his models to illustrate. If the finding had included the express statement that all along during the period of the making and use of these illustrative models Hall intended that his invention should be ultimately employed practically on electric railways, it could have made no difference whatever with the conclusion reached. It has already been seen that the working models were not reduction to practice, and hence it follows that in an utter absence of diligence for more than a quarter of a century there is no possible ground for an award of priority as against a subsequent inventor who displayed diligence in filing his caveat, diligence in applying for a patent, which application itself constitutes constructive reduction to practice, and diligence in introducing his invention into public use.

It is also alleged as error that the question of priority of invention is not determined, and cannot be determined, by a question of intention on the part of an alleged inventor, and, admitting it to be true, for the sake of argument, that Hall never intended to apply his apparatus as made to practical purposes, yet, if such apparatus were so applicable, he was the first inventor, whether he believed the fact to be as indicated or not. In proof of this allegation are cited *Harmet* v. *Reese*, (21 O. G., 1875,) *Read* v. *Cutter*, (1 Story, 590,) and a number of other cases.

It is unquestionably true that the capacity of an apparatus, or what may be designated its embodied intent, determines its patentable character rather than the intention which resides in the mind of the inventor; or, as it is sometimes phrased, an invention patented for one purpose is protected for all the purposes which it is adapted to subserve. The trouble with this claim is that I find nothing in the decision which is contrary to it. It is expressly decided that Hall's devices were mere working models and nothing more, and it is too much to assume that because such models did perform their illustrative function therefore a practical railway could be operated by a simple enlargement of all the parts of the apparatus thus employed. The allegation of error assumes that the apparatus as made was adapted to practical purposes by mere enlargement, an inference which is utterly inconsistent with the subsequent history—or rather want of history—of the development of Hall's ideas.

Again, it is claimed that the very fact of an application being put in interference necessarily determines that the apparatus therein described is an apparatus which has been reduced to practice, if it has been used at all. This argument seems to imply that the Patent Office, before placing two applications in interference, not only decides that both parties claim the invention in controversy, but also that they claim it in a form which is capable of commercial use. Such, however, is not the case. The Office possesses no machinery by which such facts are ascertained, and assumes, for the purpose of declaring the interference, that the inventions are substantially within the issue, although the subsequent history of the rival inventions may show that one of them is in a form which is afterward demonstrated to be of great commercial value, while the other is incapable of any practical use whatever. Experience is the only test by which such questions can be determined.

I have thus considered, I think, the several grounds of error alleged, although not in the order pursued in the motion for a rehearing. It results that I find no error in the decision complained of, and the motion is therefore denied.

GREEN *v.* HALL *v.* SIEMENS *v.* FIELD.

Decided June 10, 1889.

After a final award of priority there is no more reason for permitting the defeated party to the interference to be heard upon the relation of the prevailing party to the prior art than there would have been for permitting the same privilege before the institution of the interference.

ON motion.

ELECTRIC RAILWAYS.

Application of George F. Green filed May 15, 1886, No. 202,287. Application of Thomas Hall filed July 22, 1885, No. 172,325. Application of Ernst W. Siemens filed October 25, 1884, No. 146,473. Application of Stephen D. Field filed March 10, 1880, No. 4,752.

Mr. Benjamin Butterworth for Green.

Mr. E. N. Dickerson and *Messrs. Foster & Freeman* for Hall.

Mr. C. S. Whitman for Siemens.

Mr. F. L. Pope, *Mr. F. W. Whitridge*, and *Messrs. Marble & Mason* for Field.

MITCHELL, *Commissioner:*

This motion was filed on the 19th day of April, 1889. Prior to that time the interference to which it relates had been adjudicated in favor of Field; motions for rehearings on behalf of Siemens and Green had been denied, and the interference having terminated, steps were taken to determine whether the application of Field, considered as an *ex parte* application, contained patentable subject-matter, in view of British patent to Clark, No. 1,386 of 1864, taken in connection with the state of the art. This is therefore a motion made on behalf of Siemens to permit the defeated parties in an interference proceeding to be heard upon the question whether the invention of the prevailing party is met by the prior art, including a particular patent specified.

As I understand the practice, the conclusion of an interference restores the application of the prevailing party to the same status which it occupied prior to the institution of the interference, so that there is no more reason for permitting the defeated parties to the interference to be heard upon the relation of the prevailing party to the prior art than there would have been for permitting the same persons to exercise the same privilege before the institution of the interference. Perhaps it is within the power of the Commissioner to grant such a motion as this; but it is manifestly contrary to the generally-accepted rights of an *ex parte* applicant in this Office, and I see no reason why the motion should be granted in this case which does not apply to all cases similarly situated.

The motion must be denied.

EX PARTE ANDERSON.

Decided June 12, 1889.

ON petition.

ROCK-CRUSHERS, &C.

Application of David H. Anderson filed September 17, 1888, No. 285,567.

Mr. W. A. Bartlett for applicant.

MITCHELL, *Commissioner:*

This application, although coming before me as if it were a petition, is, in fact, a complaint made against the examiner, reciting the several actions taken in the case which are claimed to constitute improper and oppressive practice.

Without minutely inspecting the several items of the charge, I cannot resist the impression—and it is a very decided impression—that there is ground for the complaint, and it is a matter of regret that after my predecessor had been called upon to act in this case and had made a decision which, to my mind, indicates that he was clearly of the same opinion that I am compelled to entertain, the examiner should not have taken steps to hasten rather than to protract the examination and proceedings in the application. I am not satisfied with the examiner's explanation. Making due allowance for all obstacles, I have no doubt whatever that this case could have been in condition for allowance or for appeal to the Examiners-in-Chief if it had been the aim of the examiner to afford every facility to the applicant consistent with the rights of others.

Steps will be taken at once—if they have not been already taken—to put this application into condition for allowance or appeal.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Eastern District of Missouri, Eastern Division.

HEINE SAFETY BOILER COMPANY *v.* SMITH FEED WATER HEATER AND PURIFIER COMPANY.

Decided February 16, 1889.

1. CONSTRUCTION OF PATENTS—COMBINATIONS.
In cases where none of the elements of a combination are new or are claimed separately and there are other similar kindred combinations in use the evident tendency of late decisions is to limit the patentee to the particular form of the various elements composing the combination shown by his drawings.

2. HEINE—PURIFIERS FOR FEED-WATER FOR STEAM-BOILERS.
Applying this rule to Letters Patent No. 304,195, granted August 26, 1884, to Hermann Heine, for purifiers for the feed-water of steam-boilers, the patent is not infringed by a device differing essentially therefrom in construction.

3. SAME—VALIDITY.
If the claim were to receive a broader construction, it is by no means certain that it is valid and ought to be sustained, in view of the state of the art when the patent issued.

ON motion for preliminary injunction.

Patent No. 304,195, granted August 26, 1884, to Hermann Heine, for purifiers for the feed-water of steam-boilers.

Mr. Paul Bakewell for the complainant.

Messrs. Lee & Ellis and *Messrs. Fowler & Fowler* for the defendants.

THAYER, *J.:*

From the affidavits and other moving papers on file in support of the motion, the following facts appear and are substantially admitted, or at least are not denied, to wit: First, that defendant has been publicly manufacturing the alleged infringing device for heating and purifying feed-water introduced into steam-boilers, for the space of 2½ years, at St. Louis, Mo., or in its immediate vicinity; second, that complainant's chief office and place of business in the meantime has been located in said city; third, that defendant's device is now in use on at least 16 different railroads throughout the United States, which companies are of course guilty of infringement if defendant is guilty; fourth, that the published directions for the use of its device, heretofore issued by the defendant, show that its purifier is located below the normal water-line, and its location in that position seems to be the chief matter complained of by the complainant; fifth, that complainant had been aware of the alleged acts of infringement for at least 6 months prior to the filing of its complaint, if not longer; sixth, that defendant's sole business consists in manufacturing its device merely as an attachment to steam-boilers, and that it has a large number of men employed, and many outstanding contracts upon which it is liable to a large amount, while complainant's chief business is the manufacture and sale of the Heine patent steam-boiler, of which the mud-drum or water-purifier that is said to be infringed is only a secondary feature; seventh, that an injunction if awarded would arrest the defendant's entire business, and would work great, if not irreparable, mischief if it turns out that the rights asserted by it (the defendant) are valid; eighth, that defendant's water-purifier is itself a patented device, and that several patents have heretofore been granted for various mud-drums or purifiers located in the interior of steam-boilers of a kindred character to those involved in this controversy, some of which antedate complainant's patent; ninth, that thus far there has not been a single adjudication upholding the validity of the second claim of complainant's patent, on which this application is based, nor a single adjudication determining, if valid, the scope of the claim, or whether it will bear the broad construction contended for and that must be conceded to it if the defendant's device is held to be a violation of the same.

I may further add that it is not even suggested that defendant is irresponsible or liable to become so, and that it will not be able to respond for the probable amount of damage inflicted if complainant is successful on final hearing. Nor does it seem at all likely that the acts complained of will seriously affect complainant's business in the meantime, inasmuch as the Heine steam-boilers that it makes have primary merits, which probably create the chief demand for the same, other than the particular mud-drum attachment that is said to have been infringed.

That complainant is engaged in putting its mud-drum or purifier in other boilers than the Heine boiler, and that defendant comes into direct competition with it in that line of business, is not pretended. Under the circumstances, therefore, I apprehend that even complainant's counsel will concede that an injunction at this time or other equivalent preliminary order would not be warranted unless the infringement complained of is palpable.

The claim of complainant's patent that is said to have been infringed in this instance is what is known as a combination claim.

I claim [says the patentee] the combination, with the upper shell or circulating drum of a water-tube steam-generator, of a mud-drum mounted within said circulating-drum, below the normal water-line, the feed and outlet passages being at the same end of the mud-drum, so that the current is opposed to the feed-current, and is deflected backward by the upward current in the water-leg.

Neither element of the combination, not even the mud-drum itself, is claimed separately as being novel and patentable. In cases where none of the elements of a combination are new or are claimed separately, and there are other similar or kindred combinations in use, the evident tendency of late decisions is to limit the patentee to the particular form of the various elements composing the combination shown by his drawings. If such a rule is applied in the present case, defendant's purifier does not infringe, because it differs very essentially in construction from complainant's mud-drum, having a diaphragm dividing it into an upper and lower section, which compels the feed-water to flow through its entire length and then backward before entering the boiler proper, whereas complainant's mud-drum is not so divided; and it may be questionable whether it (complainant's mud-drum) compels such a perfect circulation of water within the purifier and consequent deposit of sediment.

It is only by giving the second claim of complainant's patent a construction that would make it cover all possible forms of mud-drums mounted inside of steam-boilers below the normal water-line, and that receive and discharge feed-water at the same end, that defendant's purifier can be said to be an infringement of the claim.

It does not appear to me to be clear that the claim in question should receive such a broad construction, or if that is the necessary construction of the claim it is by no means certain that the claim is valid and ought to be sustained in view of the state of the art when the patent was issued. I shall reserve both of these questions for more thorough investigation on final hearing. It is sufficient to say now that complainant's right is not so palpable as to warrant an injunction or an order to give bond. I will enter an order requiring the defendant to file in this court quarterly, until final hearing, a report of the number of purifiers by it manufactured and placed in steam-boilers under the Smith patent. That is as far as I think it necessary or proper to go at this time.

Withdrawal of Photolithographs, &c.

(ORDER No. 530.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., June 8, 1889.

From and after this date the withdrawal of the photolithographs, and in process and composition patents the copies of specifications and claims, from the classified sets in the Draftsman's Division, for any purpose whatever, by examiners, attorneys, or others, is prohibited. These classified sets will be retained intact and held accessible to the public from 9 o'clock a. m. to 4 o'clock p. m. daily. Such copies as may be desired for use by examiners will be promptly furnished from the unclassified sets upon application to the Draftsman's Division.

The Chief of the Draftsman's Division will cause all classes and sub-classes embraced in these sets to be made complete, and be put in order, and kept so.

C. E. MITCHELL,
Commissioner.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Issue of June 25, 1889.

DESIGNS.

19,171.—SHIRT-BOSOM.—*Albert Borchardt*, Hoboken, N. J., assignor to *Victor Henry Rothschild*, same place. Application filed May 13, 1889. Serial No. 310,644. Term of patent 3½ years.

19,172.—DESK-CURTAIN.—*Francis A. Coffin*, Indianapolis, Ind. Application filed January 24, 1889. Serial No. 297,442. Term of patent 7 years.

19,173.—BACKS OF PLAYING-CARDS.—*Stanley A. Cohen*, New York, N. Y. Application filed April 8, 1889. Serial No. 306,445. Term of patent 14 years.

19,174 to 19,176, inclusive.—SURFACE ORNAMENTATION OF GLOVE-BUTTONS.—*Louis A. Doutllet*, New York, N. Y. Applications filed April 19, 1889. Serial Nos. 308,899 to 308,901, inclusive. Term of patents 14 years.

19,177.—MATCH-BOX.—*Harry P. Fairchild*, New York, N. Y. Application filed May 27, 1889. Serial No. 312,301. Term of patent 3½ years.

19,178.—CLOTH FOR CLOAKING.—*Morris Fatman*, New York, N. Y. Application filed June 1, 1889. Serial No. 312,932. Term of patent 3½ years.

19,179.—MEAT-RACK.—*Charles A. Gloekler*, Pittsburg, Pa. Application filed May 22, 1889. Serial No. 311,732. Term of patent 14 years.

19,180.—MITT.—*Leander C. Hall, Jr.*, Philadelphia, Pa. Application filed January 5, 1889. Serial No. 295,567. Term of patent 7 years.

19,181.—FONT OF PRINTING-TYPE.—*Charles E. Heyer*, Chicago, Ill. Application filed May 31, 1889. Serial No. 312,794. Term of patent 14 years.

19,182.—BOTTLE.—*William W. Lowrey*, Baltimore, Md. Application filed May 9, 1889. Serial No. 310,145. Term of patent 14 years.

19,183.—BASE FOR FARINA-BOILERS.—*Alexander Stewart*, Philadelphia, Pa. Application filed May 13, 1889. Serial No. 310,645. Term of patent 7 years.

19,184.—SPOON, &c.—*George P. Tilton*, Newburyport, Mass., assignor to *The Towle Manufacturing Company*, same place. Application filed May 27, 1889. Serial No. 312,302. Term of patent 7 years.

19,185.—FINGER-NAIL POLISHER.—*J. Parker Pray*, New York, N. Y. Application filed January 24, 1889. Serial No. 297,434. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,740.—PLUG CHEWING-TOBACCO.—*Bitting & Hay*, Winston, N. C. Application filed May 8, 1889. Used since February 6, 1889.

"The words 'HUMMING BIRD.'"

16,741.—CUT SOLES, TAPS, INSOLES, AND HEEL-LIFTS OF LEATHER. *Forest Delaney & Son*, New York, N. Y. Application filed April 29, 1889. Used since February 1, 1880.

"The representation of a shoemaker sitting at his bench with right hand upraised holding a hammer, the other hand holding a sole in position for hammering on a lapstone, while at one side are piles of cut soles, and at the other side are similar soles in a tub, as for soaking or tempering, and beneath the whole is the title 'ST. CRISPIN.'"

16,742.—CIGARS.—*Benedict Finn*, Newark, N. J. Application filed May 21, 1889. Used since May 1, 1889.

"The words 'ANNIE OAKLEY.'"

16,743.—VELVETS AND PLUSHES.—*Goldschmidt, Bachrach & Co.*, New York, N. Y. Application filed April 20, 1889. Used since January 1, 1889.

"The words, letters, and character 'J. G & Co' and 'GERMANIA BRAND.'"

16,744.—BOILER COMPOUND TO PREVENT INCRUSTATION.—*James F. Hotchkiss*, New York, N. Y. Application filed October 1, 1888. Used since September 26, 1888.

"The word 'TRIPSA.'"

16,745.—GALVANIZED IRON.—*Morewood & Company's Successors*, (*Limited*,) Birmingham, England. Application filed April 26, 1889. Used since the year 1864.

"The representation of a lion."

16,746.—SARDINES.—*Frederic Reisel*, New York, N. Y. Application filed November 6, 1888. Used since February 3, 1886.

"The words 'YACHT CLUB.'"

16,747.—ENAMEL PAINT.—*Frank Smith*, New York, N. Y. Application filed May 21, 1889. Used since September 15, 1888.

"The word 'GLASSINE.'"

16,748.—PAINT COMPOUND IN THE FORM OF PASTE.—*Frank Smith*, New York, N. Y. Application filed May 21, 1889. Used since September 15, 1888.

"The word AQUOL.'"

16,749.—POMADE FOR THE SKIN.—*Mary Sedley Smith*, New York, N. Y. Application filed April 6, 1889. Used since January 10, 1889.

"The words 'ELMA CREAM.'"

16,750.—LAGER-BEER.—*Joseph Wagner*, Munich, Germany. Application filed May 24, 1889. Used since July 1, 1888.

"The word 'AUGUSTINER.'"

16,751.—PERFUMERY.—*Richard D. Young*, New York, N. Y. Application filed May 8, 1889. Used since August 6, 1888.

"The representation of a quarterfoil and the letter 'Y' on the same."

16,752.—PERFUMERY.—*Richard D. Young*, New York, N. Y. Application filed May 8, 1889. Used since August 6, 1888.

"The words 'PRAIRIE WILD.'"

16,753.—PERFUMERY.—*Richard D. Young*, New York, N. Y. Application filed May 8, 1889. Used since August 6, 1888.

"The words 'BOUQUET ARABY.'"

16,754.—PERFUMERY.—*Richard D. Young*, New York, N. Y. Application filed May 8, 1889. Used since August 7, 1888.

"The word 'MELAURA.'"

16,755.—PERFUMERY.—*Richard D. Young*, New York, N. Y. Application filed May 8, 1889. Used since August 7, 1888.

"The words 'LILY BELLS.'"

16,756.—BISCUITS, WAFERS, AND CRACKERS.—*Holmes & Coutts*, New York, N. Y. Application filed May 31, 1889. Used since April 2, 1889.

"The words 'SOCIAL TEA.'"

16,757.—FACE-POWDER.—*Lorenzo Tomaselli*, Washington, D. C. Application filed May 27, 1889. Used since the year 1870.

"The word "ROSINA.'"

16,758.—MILK-PUNCH.—*Aloysius E. Offutt*, New York, N. Y. Application filed May 29, 1889. Used since May 1, 1889.

"The word 'IMPERIAL.'"

16,759.—NON-ALCOHOLIC HERB-BEER.—*Newball & Mason*, Nottingham, county of Nottingham, England. Application filed May 29, 1889. Used since January 1, 1875.

"The representation of a pump."

LABELS.

5,949.—Title: "ROCK CANDY."—*Dryden & Palmer*, New York, N. Y. Application filed May 28, 1889.

5,950.—Title: "NOTICE" (FOR CASKETS INCLOSING BOXES OF CIGARS.)—*John Sidney Goldsmith*, New York, N. Y. Application filed May 17, 1889.

5,951.—Title: "ROCK CANDY."—*William Lang & Son*, Philadelphia, Pa. Application filed May 27, 1889.

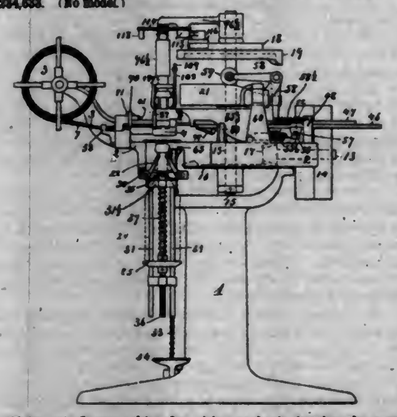
5,952.—Title: "VENN'S WONDERFUL ASTHMA CURE."—*Thomas Venn*, Shamokin, Pa. Application filed June 4, 1889.

5,953.—Title: "WILHELMS-QUELLE" (FOR MINERAL WATERS.)—*Ernst von Eckardstein*, Protzel, Germany. Application filed May 23, 1889. (Trade-Mark Registered.)

5,954.—Title: "THE LENOX SUIT" (FOR LADIES, MISSES AND CHILDREN'S SUITS.)—*Wightman & Co.*, New York, N. Y. Application filed April 12, 1889.

PATENTS

GRANTED JUNE 25, 1889.



405,687. CUFF-HOLDER. GEORGE B. ADAMS, Irvington, N. J. Filed Nov. 23, 1888. Serial No. 291,656. (No model.)

Claim.—1. In a cuff-holder, the combination, with an arm provided with means for attaching the same to a cuff or other article, of a head or button secured to said arm by means of a stem extending up from said arm and projecting up into the upper clamping-head, which consists of a casing, as set forth, and engaging with a spring arranged within said casing and operating to cause the holding-contact of the head and arm, for the purposes set forth.

2. As an improved article of manufacture, the herein-described cuff-holder consisting of a head or button *d*, pivotally secured to a stem *d'* and provided with teeth and a spring *d²*, and the jaw *c*, provided with teeth *c²*, said jaw being secured to an arm *a*, for securing the same to a cuff, substantially as described.

405,688. MACHINE FOR WIRING CORKS IN BOTTLES. BENJAMIN ADRIANCE, Brooklyn, N. Y. Filed Sept. 5, 1888. Serial No. 284,633. (No model.)

Claim.—1. In a machine for wiring corks in bottles, the combination, with feeding mechanism arranged to draw two wires across the neck of the bottle, of mechanism for twisting the wires near the middle of their length, a pad movable to and from the bottle-neck to press the wires thereon, back-twist nippers with two hooks extended along the opposite sides of the bottle-neck to draw two of the wire ends behind the neck, and rotary to twist the same together, top-twist nippers reciprocatory to and from the top of the bottle and having hooks adapted to grasp the wires and draw them together upon the top of the cork, a rotary sleeve and cutter to grasp the wires and twist the same, and connected mechanism for operating the several mechanisms in due order, as and for the purpose set forth.

2. In a machine for wiring corks in bottles, the combination, with wire-cutting dies arranged to hold a wire therein, of wire-feeding nippers, the nippers and cutting-dies being movable in relation to one another and arranged to draw the wire across the bottle-neck, twisting mechanism movable to and from the path of the wires, a pad and cutters movable to and from the bottle-neck, and mechanism for operating the pad and cutters to simultaneously sever the wires at the cutting-dies and to press the twisted portion of the wires upon the bottle, as and for the purpose set forth.

3. In a machine for wiring corks in bottles, the combination of a yielding cutting-die with a wire guide or guides held stationary in relation to such movable die, the cutting-die being sustained upon the guide, pressed away from the same by a spring, and its stroke limited by a stop 45, as and for the purpose set forth.

4. In a machine for wiring corks in bottles, the combination, with two wire-guides and two yielding wire-dies, of two nippers reciprocated to and from the dies, one of the nippers being projected beyond the other, and connected mechanism operating to open the nippers, when pressed against the dies, to admit the wire projected therefrom, and to close the nippers, when retracted from the die, to grasp and draw the wire therefrom, as and for the purpose set forth.

5. In a machine for wiring corks in bottles, the combination, with suitable devices for stretching the wires across the neck of the bottle, of back-twist nippers provided with two hooks movable to and from the path of such stretched wires, and connected mechanism for pressing the hooks toward the neck of the bottle while retracted to draw the wires together behind the same, and for rotating the hooks to twist the wires together, as and for the purpose set forth.

6. In a machine for wiring corks in bottles, the combination, with suitable devices for stretching two wires across the neck of the bottle, for twisting them together, and for twisting two of the wire ends behind the neck of the bottle, of top-twist nippers provided with three hooks and reciprocatory to and from the path of the wires, rotary cutters adapted to receive the wires from the three hooks, and connected mechanism for reciprocating the hooks to and from the path of the wires for pressing the hooks together while drawing the wires above the top of the bottles, and for rotating the cutters to twist the ends of the wires, as and for the purpose set forth.

7. In a machine for wiring corks in bottles, the combination, with suitable devices for applying and twisting the wires upon the bottle-head, of lifters fitted to the under side of the bottle-head and adapted to grasp the neck of the bottle, and connected mechanism operating to elevate the lifters and raise the lower side of the bottle-head to a fixed point, as and for the purpose set forth.

8. In a machine for wiring corks in bottles, the combination, with devices for holding the wires transversely to the bottle-neck, of a combined bottle lifter and gage having jaws fitted to the neck of the bottle and sustaining the weight of the same by contact with the under side of the head, and connected mechanism operating to reciprocate the lifter to and from the wires, as and for the purpose set forth.

9. In a machine for wiring corks in bottles, the combination, with two reciprocatory feed-bars having different strokes and carrying nippers, of two yielding wire-dies adjusted at different heights in relation to the bottle, dogs carried by the feed-bars, and connected mechanism for operating the dogs to close the nippers upon the wires and for reciprocating the feed-bars to draw simultaneously from the dies two wires of different lengths, as and for the purpose set forth.

10. In a machine for wiring corks in bottles, the combination, with two feed-bars, one provided with a projection fitted to play in a recess in the other, of nippers provided with dogs and rods for closing the nippers, two yielding wire-dies opposed to the nippers, and connected mechanism for reciprocating one of the bars and for actuating the dogs to close the nippers, the whole being adapted to draw simultaneously from the dies two wires of different lengths, as and for the purpose set forth.

11. In a machine for wiring corks in bottles, the combination, with the movable head 30, having the lifters 28 pivoted thereon and provided with arms 35, of the stationary guide 31½, a rod with a spring operating beneath the guide to press the lifters normally together, a shoulder upon the spring-rod to open the lifters when lowered, and a treadle arranged and operated to lift the head 30, as and for the purpose set forth.

12. In a machine for wiring corks in bottles, the combination, with the movable head 30, having the bottle-lifters pivoted thereon, of the wheel 32, the treadle, the chains for rotating the wheel and raising the head 30, the lug upon the wheel 32, the hook 70, driving mechanism and a clutch connecting the same with the bottle-wiring devices, and a lever actuated by the lug for disengaging the clutch to start the machine when the treadle is depressed, as and for the purpose set forth.

13. In a machine for wiring corks in bottles, the combination, with the bottle-lifters pivoted in the movable head 30, and the devices for wiring the cork in the bottle, of driving mechanism, a clutch connecting the same with the bottle-wiring devices, the wheel 32, lug 65, hook 70, and clutch-lever 66, the cam 67, rotated with the clutch, the lever 68, and the inclined arm 69, for lifting the hook 70, the whole arranged and operated substantially as herein set forth.

14. In a machine for wiring corks in bottles, the combination, with lifters arranged to grasp the neck of the bottle and appliances for drawing the wire across the neck of the bottle, of means for raising the lifters into a line with the wire, substantially as herein set forth.

15. In a machine for wiring corks in bottles, the combination, with bottle-lifters pivoted upon the movable head 30, of devices for securing the wires upon the bottle-neck and cork, appliances for drawing the wire across the neck of the bottle, driving mechanism and a clutch connecting the same with the wiring devices, the wheel 32, a treadle and chains operated as described, clutch-starting mechanism actuated by a lug upon the wheel, and a hook for engaging the lug and retaining the ends of the lifters upon a level with the wire, as and for the purpose set forth.

16. In a machine for wiring corks in bottles, the combination, with wire-cutting dies and nippers for drawing the wire from the same, of a rotary wheel notched at one side and applied to the wire near the middle of its length, and connected mechanism for rotating the notched wheel to twist the wire, as and for the purpose set forth.

17. In a machine for wiring corks in bottles, the combination, with wire-cutting dies and nippers for drawing the wire from the same, of a rotary wheel notched at one side, mechanism for rotating the notched wheel to twist the wire, as set forth, a cutter for severing the wire at the wire-die, and a pad for pressing the wire upon the bottle-neck, substantially as described.

18. In a machine for wiring corks in bottles, the combination, with wire-cutting dies and nippers for drawing the wire from the same, of a rotary twister, mechanism for rotating the twister to twist the wire, as set forth, a cutter for severing the wire at the wire-dies, a pad for pressing the wire upon the bottle-neck, rotary back-twist nippers, and mechanism for operating the said nippers to draw the wire ends behind the bottle-neck and to twist them together, substantially as described.

19. In a bottle-wiring machine, the combination, with wire-dies and nippers for drawing the wire from the same, of a rotary wheel notched at one side to twist the wire, as set forth, a cutter for severing the wire at the wire-die, a pad for pressing the wire upon the bottle-neck, back-twist nippers to draw the wire ends behind the bottle-neck and to twist them together, top nippers for drawing the wire ends above the top of the bottle, a notched top twister to receive the ends of the wires and twist them upon the cork, and connected mechanism for operating the several mechanisms in due order, substantially as described.

20. In a bottle-wiring machine, the combination, with wire-dies and nippers for drawing the wire from the same, of a rotary wheel notched at one side to twist the wire, as set forth, a cutter for severing the wire at the wire-die, a pad for pressing the wire upon the bottle-neck, back-twist nippers to draw the wire ends behind the bottle-neck and to twist them together, two nippers for drawing the wire ends above the top of the bottle, a notched top twister to receive the ends of the wire and twist them upon the cork, cutters for severing the ends when twisted, and connected mechanism for operating the several mechanisms in due order, as and for the purpose set forth.

21. In a bottle-wiring machine, the combination, with wire-dies and nippers for drawing the wires therefrom, of the notched wheel 169, the cutters 81, a vibrating arm carrying the said wheel and cutters, and connected mechanism for vibrating the arm and reciprocating the wheel and cutters to and from the wires, as and for the purpose set forth.

22. In a bottle-wiring machine, the combination, with wire-dies and nippers for drawing the wires therefrom, of the arm 85½, the notched wheel 169, carried thereby, a pinion connected with the notched wheel, a rack movable transverse to the arm 85½, and connected mechanism operating to vibrate the arm to and from the wires and to reciprocate the rack in the arm, as and for the purpose set forth.

23. In a bottle-wiring machine, the combination, with wire-dies and nippers for drawing the wires therefrom, the arm 85½, the notched wheel 169, carried thereby, a pinion connected with the notched wheel, a spring to rotate the pinion, a rack movable transverse to the arm 85½ to rotate the pinion, a latch to hold the pinion when rotated in opposition to the spring, and connected mechanism operating to vibrate the arm, as and for the purpose set forth.

24. In a bottle-wiring machine, the combination, with wire-dies and nippers for drawing the wires therefrom, of the arm 85½, the notched wheel 169, carried thereby, a pinion connected with the notched wheel, a spring to rotate the pinion, a rack movable transverse to the arm 85½ to rotate the pinion, a latch to hold the pinion when rotated in opposition to the spring, a trip to disengage the latch, a stationary dog, and connected mechanism operating to vibrate the arm, as and for the purpose set forth.

25. In a bottle-wiring machine, the combination, with wire-dies and nippers for drawing the wires therefrom, of the notched wheel 169 and the cutters 81, mounted upon the swinging arm 85½, a pinion connected with the notched wheel, a rack movable transverse to the arm 85½, a stop to restrict the movement of the arm, and a lever linked to the arm 85½ and movable independently to reciprocate the rack, and connected mechanism operating to vibrate the lever, as and for the purpose set forth.

26. In a bottle-wiring machine, the combination, with wire-dies and nippers for drawing the wires therefrom, of the arm 85½, the notched wheel 169, carried thereby, a pinion connected with the notched wheel, a rack movable transverse to the arm 85½, a carrier pivoted upon the arm, a pad and wire-cutters fixed upon the carrier, a connection with the notched pinion to raise the pad and cutters into line with the wire, and connected mechanism operating to vibrate the arm 85½, as and for the purpose set forth.

27. In a bottle-wiring machine, the means for forming right and left hand twists adjacent to one another in the two wires, consisting in the bearings 173, provided each with pins 174, and the rotary pinion 169, provided with notch 171 and pins 172, and connected mechanism operating to rotate the pinion a complete revolution when engaged with the wires, as and for the purpose set forth.

28. In a bottle-wiring machine, the back-twist nippers consisting in the hooks 175, formed with bent arms, as described, and hinged upon the rod 176, a friction-clamp for such rod, the fork 177, fixed upon the sleeve 178, and connected mechanism to reciprocate the fork over the rod 176, as and for the purpose set forth.

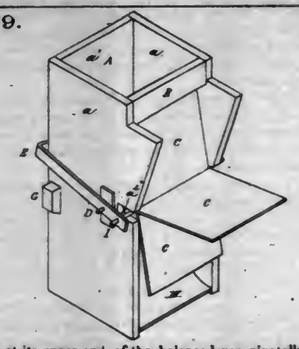
29. In a bottle-wiring machine, the back-twist nippers consisting in the hooks 175, pivoted upon the rod 176, and the fork 177, fixed upon the sleeve 178, the cam-lever 179, for reciprocating the sleeve over the rod, the pinion 180 upon the sleeve, and a cam-lever 181, for rotating the pinion, as and for the purpose set forth.

30. In a bottle-wiring machine, the combination, with top nippers having hooks to draw the wires above the top of the cork, of the thimble 182, provided with notches 183 to receive the wires, and the cutter-head 184, notched to match the thimble and rotary within the same, and connected mechanism for operating the said parts in due order, as and for the purpose set forth.

31. In a bottle-wiring machine, the combination, with the notched thimble-sleeve formed with shoulder 186, of the collar 187, carrying the nipper-hooks 188, provided with inclined shoulders 191, the tubes 189, the pressers 190, carried upon the same to actuate the hooks, and mechanism operated to reciprocate the tube and raise the collar into contact with the shoulder 186 to lift the thimble from the cork, as and for the purpose set forth.

32. In a bottle-wiring machine, the combination, with a sleeve carrying a collar fitted to feather 119 upon the sleeve and provided with the top-twist nipper-hooks 188, of the notched thimble attached to the sleeve, a notched cutter and cutter-shaft rotary within the same, a slot and pin movably connecting the cutter-shaft and sleeve, a pinion upon the cutter-shaft, a rack or segment 114, and a cam and lever for actuating the rack to rotate the pinion, as and for the purpose set forth.

33. In a bottle-wiring machine, the combination, with a sleeve carrying a collar fitted to feather 119 upon the sleeve and provided with the top-twist nipper-hooks 188, of the notched thimble attached to the sleeve, a notched cutter and cutter-shaft rotary within the same, a slot and pin movably connecting the cutter-shaft and sleeve, a pinion upon the cutter-shaft, a cam-lever provided with a toothed segment to drive the pinion, a stop near one end of the segment, an arm projected from the sleeve to meet such stop, and a cam to vibrate the cam-lever, as and for the purpose set forth.



405,689. ROTATING GRAIN-METER.

HENRY APPLER, Saratoga, Ill. Filed Dec. 16, 1886. Renewed May 24, 1889. Serial No. 311,914. (No model.)

Claim.—1. The combination, with the hopper, of the balance-lever pivotally secured to the sides thereof, and the revolving cut-offs having a common shaft journaled in the balance-lever, one of said cut-offs serving as a bottom for the hopper, while the next one is in contact with a stop, substantially as set forth.

2. The combination, with the hopper having the stop B across its front side at its upper end, of the balance-lever pivotally secured to the sides of the hopper, and the revolving cut-offs adapted to impinge against the stop B and mounted on a shaft journaled in the balance-lever, substantially as set forth.

405,689.

3. The combination, with the hopper having the stop B and the notches a^3, of the balance-lever pivotally secured to the sides of the hopper, and the revolving cut-offs adapted to impinge on the stop B and having their shaft journaled in the balance-lever and playing in the notches a^3, substantially as specified.

4. In combination with the hopper, the series of cut-offs, one of which is extended across the width of the hopper, so as to serve as a bottom therefor, while the next one is in contact with a stop, thereby preventing the rotation of the cut-offs, as set forth.

405,690. COMBINED PROJECTILE AND GAS-CHECK.

ALBERT BALL, Claremont, N. H. Filed Feb. 21, 1887. Renewed May 3, 1889. Serial No. 309,546. (No model.)

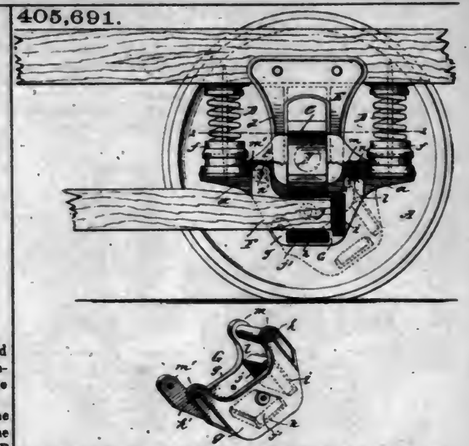
Claim.—1. A projectile having a pyramidal base provided with a sabot of homogeneous composition and simple structure applied closely to the whole area of its base, and secured to it by a temporary fibrous covering that closely fits both the sabot and the projectile, substantially as specified, whereby motion in a forward direction will be simultaneously imparted to them by the explosion.

2. A projectile having a pyramidal base provided with a sabot of homogeneous composition and simple structure applied closely to the whole area of its base, and secured to it by a temporary fibrous covering that closely fits the sides of them both, and is secured at the rear of the sabot in a recess formed therein, substantially as set forth.

3. A projectile having a sabot of homogeneous composition and simple structure applied to the whole area of its base, a film to prevent adhesion interposed between the sabot and projectile and normally in contact with the whole transverse area of each, and a covering closely embracing the sabot, projectile, and interposed film, whereby the parts, being of substantially uniform diameter, are held in close relation to each other until the covering is torn, when the projectile issues from the barrel, substantially as specified.

4. A projectile having a base angular in cross-section, and having a sabot of homogeneous composition and simple structure fitting the whole area of the base, and a covering tightly embracing both with an interposed film to prevent adhesion, substantially as set forth, whereby the main body of the projectile is adapted to be rotated with the sabot in a gun-barrel and separated from it as soon as it leaves the barrel.

405,691. TRUCK FOR CABLE-RAILWAY CARS.



SUMNER A. BEMIS, Springfield, Mass. Filed Apr. 22, 1889. Serial No. 308,063. (No model.)

Claim.—1. The combination, with a suitable part of a railway-car truck, of a pocket-frame for carrying a grip-beam, consisting of opposing cheek-pieces having intermediate horizontal and vertical walls *h i*, and by one end pivotally hung on and by its other adapted to be detachably connected with the truck, substantially as described.

2. The combination, with a suitable part of a railway-car truck, of a pocket-frame for carrying a grip-beam, consisting of opposing cheek-pieces having intermediate horizontal and vertical walls *h i*, provided with cushions, and by one end pivotally hung on and by its other adapted to be detachably connected with the truck, substantially as described.

3. The combination, with the journal-box provided with forwardly and rearwardly projecting steps having vertical openings therein, of the pocket-frame for carrying the grip-beam, consisting of opposing

405,691.

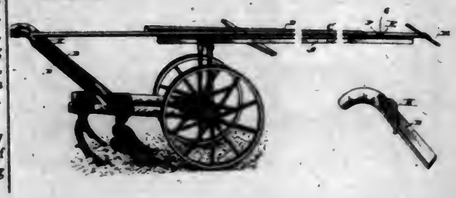
cheek-pieces having upwardly-extended projections *m m'*, and provided with the intermediate cushioned horizontal and vertical walls *h i*, and said frame, by one of its opposing pairs of extensions, being pivotally hung within the walls of one of said steps and by its other pair of extensions adapted to be detachably supported within the walls of the other of said steps, substantially as described.

4. A grip-beam-carrying pocket-frame consisting of vertical opposing cheek-pieces provided with vertical and horizontal intermediate transverse walls provided with cushions, substantially as described.

5. A grip-beam-carrying pocket-frame consisting of vertical opposing cheek-pieces, each provided with forward and rearward upward projections *m m'* and united by the transverse vertical and horizontal walls provided with cushions, substantially as described.

405,692. INHALER.

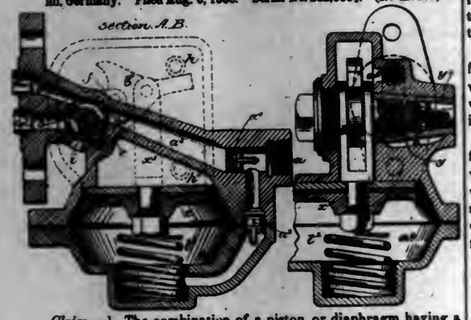
JAMES R. BRUNKER and PATRICK W. MAXWELL, Dublin, Ireland. Filed Dec. 6, 1888. Serial No. 292,807. (No model.) Patented in England July 30, 1888, No. 10,977.



Claim.—1. In an inhaler, the bed A, folding support or standard B, lamp D, and retort C, in combination with each other and with the flexible tube E, as herein specified.

2. In an inhaler, in combination with a heating-lamp D and an inhaling-tube E, the retort C, with its open end partially closed by a porous stopper and adapted to receive medicaments to be volatilized in its interior, and to allow the induction of air through the end to be inhaled through the retort, as herein specified.

3. In an inhaler, the retort C and proper supports therefor, in combination with heating means D, flexible tube E, removable porous plug or loose cotton wool for inducting air gradually without circulation thereof, and porous filled bulb F, arranged to serve substantially as herein specified.

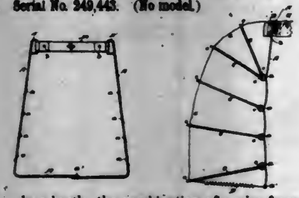


405,693. ATTACHMENT FOR PLOWS OR CULTIVATORS.

JOHN M. BURFORD, Winfield, Kans. Filed Apr. 11, 1888. Serial No. 270,808. (No model.)

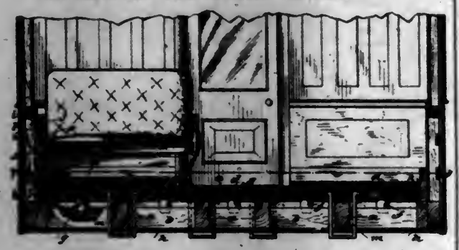
Claim.—The combination, with the tongue of a plow or cultivator, of a guiding device consisting of the lever D, pivoted upon the tongue, a bar E, pivotally secured to the lever D, a cross-piece H, and hooks K, secured upon the handles of the plow or cultivator, substantially as set forth.

405,694. **AUTOMATIC VALVE-COCK.** JAMES F. CARPENTER, Berlin, Germany. Filed Aug. 6, 1888. Serial No. 282,080. (No model.)



Claim.—1. The combination of a piston or diaphragm having a stem, a lever pivoted to said stem and movable by the piston or diaphragm, fixed projections which become the fulcrums for said lever at opposite ends of the throw of the piston or diaphragm, and a plug and lever extended therefrom and connected to the first-named lever, all arranged to operate substantially as and for the purposes described.

2. The plug *y* and the plug *y'*, loosely connected to and operated by the first-named plug, combined with a piston or diaphragm and a compound lever connected therewith and with the plug *y* and attaining its fulcrums at opposite ends of the throw of the piston or diaphragm, substantially as and for the purposes described.

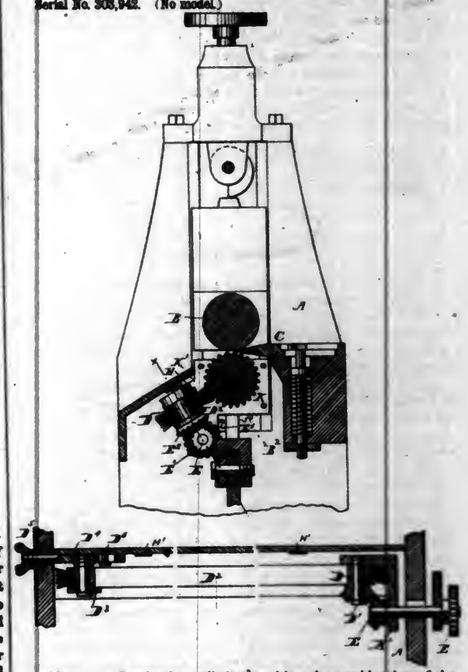


3. The combination, with an automatic valve, of substantially the character described, for railroad-brake systems and other purposes, of a compound lever, a piston or diaphragm having a stem connecting the lever and piston or diaphragm, fixed projections for shifting the lever as thrown by the piston or diaphragm, and a connection between the valve and lever, substantially as described.

405,695. **BUSTLE.** ALONZO CATHAN, Cleveland, Ohio. Filed Sept. 12, 1887. Serial No. 249,443. (No model.)

Claim.—In a bustle, the combination of a wire frame comprising parallel side bars, a lower cross-bar connecting the lower ends of said parallel side bars at right angles thereto and an upper cross-bar connecting said side bars near their upper ends and extending at right angles to said side bars, said frame having eyes at intervals along the side bars integral therewith, a series of spring-bows hinged to said eyes, the pivotal points of the lowermost spring-bow being above the plane of the lower cross-bar, a flexible strip connected at its upper end to the upper cross-bar and at intervals along its length to said hinged spring-bows, and a contractile spring connected at one end to the lower spring-bow and at the other end to the lower cross-bar of said frame.

405,696. **RAILWAY-CAR.** JEHIEL M. DAVIS, Northampton, Mass. Filed Jan. 21, 1889. Serial No. 296,999. (No model.)

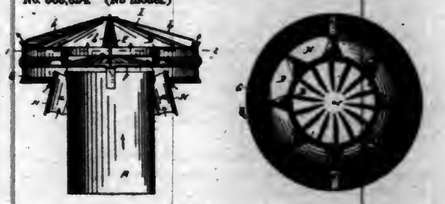


Claim.—1. In a car, the combination, with the body having the lower frame rigidly constructed thereon, of a floor spring-supported therefrom and vertically movable, and cushions between the edges of said floor and the side walls of the car-body, substantially as and for the purpose described.

2. In a car, the combination, with the body having the lower frame rigidly constructed thereon, of a floor spring-supported therefrom and vertically movable, and devices, substantially as described, to limit the upward movement of said floor, substantially as and for the purpose set forth.

3. In a car, the combination, with the body having the lower frame rigidly constructed thereon and provided in its side walls with vertical slots, of a floor spring-supported from said lower frame and vertically movable thereon, and the car-seats resting on said floor having studs at their ends playing in said slots, substantially as set forth.

4. In a car, the combination, with the body having the lower frame rigidly constructed thereon and provided in its side walls with vertical slots, of a floor spring-supported from said lower frame and vertically movable thereon, the car-seats resting on said floor having studs at their ends playing in said slots, and cushions between the ends of the seat-frames and the side walls of the car, substantially as and for the purpose described.

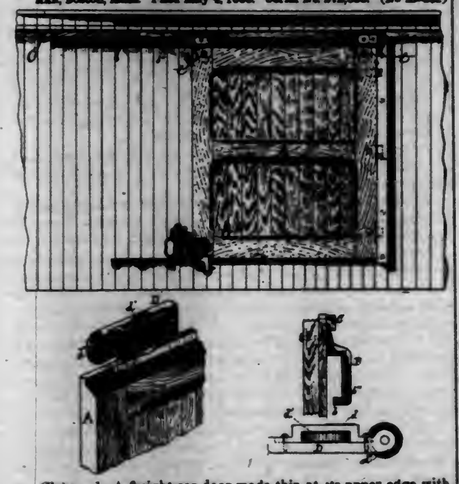


405,697. **LEATHER-SPLITTING MACHINE.** EUGENE M. DUNPHE and CHARLES BLOCKHOUR, East Bridgewater, Mass. Filed Mar. 18, 1889. Serial No. 303,942. (No model.)

Claim.—1. In a leather-splitting machine, the combination of the feed-roll B' and the brush-belt D^2, adapted to operate substantially as described, and for the purpose set forth.

2. In a leather-splitting machine, the combination of the feed-roll B' and brush-belt D^2 with the adjustable box K and bracket K', substantially as and for the purpose set forth.

405,698. **CHIMNEY CAP AND VENTILATOR.** WILLIAM EARLE, Philadelphia, Pa. Filed May 1, 1888. Renewed Mar. 16, 1889. Serial No. 303,824. (No model.)

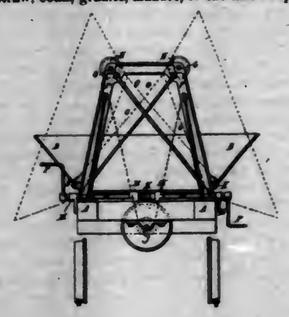


405,698.

Claim.—1. In combination with the pipe A, band G, wheel B, and top I, the corrugated flange H, adapted to deflect air both along its inside and outside to the top of pipe A, substantially as set forth.

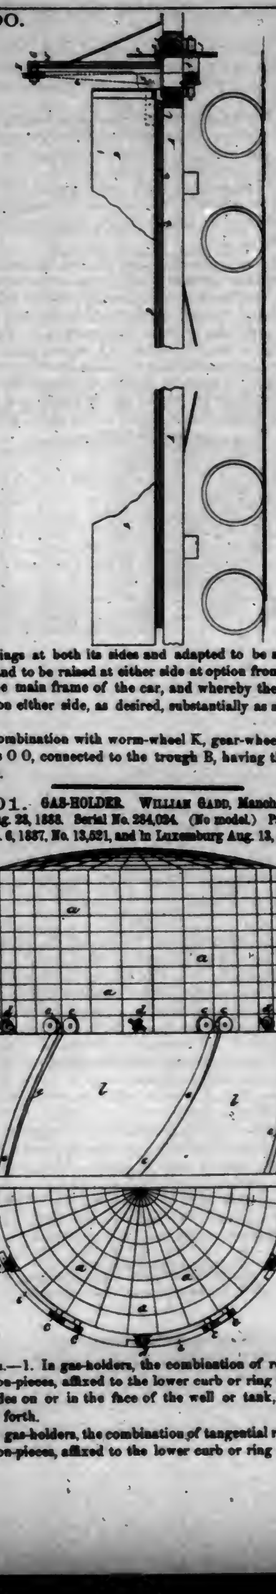
2. The combination of pipe A, wheel B, carried on a pivot E, cylinder D, band G, corrugated flange H, and corrugated top I, all arranged and operating substantially as and for the purposes set forth.

405,699. **FREIGHT-CAR DOOR AND HANGER.** WILLIAM R. EASTMAN, Boston, Mass. Filed May 4, 1888. Serial No. 272,336. (No model.)



Claim.—1. A freight-car door made thin at its upper edge with a beveled portion below to shed rain, &c., in combination with a housing whose projection is no greater than the main body of the door.

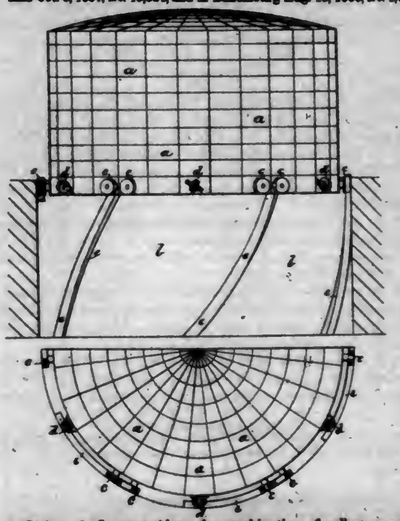
2. The combination of a truck-frame carrying a roller with horizontal axis and another with vertical axis, with a door made thin at its upper edge with a beveled portion below to shed rain and the like, and a housing which furnishes a track both above and below for the roller with horizontal axis, and a bearing-surface on one side for the roller with vertical axis and whose projection is no greater than the main body of the door.



405,700. **DUMPING-CAR.** PERCIVAL EVERITT and WILLIAM C. PAGE, New York, N. Y. Filed Mar. 28, 1889. Serial No. 305,137. (No model.)

Claim.—1. A frame of a car provided with pivotal bearings at each of its sides or edges, combined with a trough having corresponding side bearings, substantially as set forth, and with means for tipping the tray.

2. A car or carriage body suitable for conveying merchandise—such as hay, straw, coals, granite, manure, or the like—supported on



405,700.

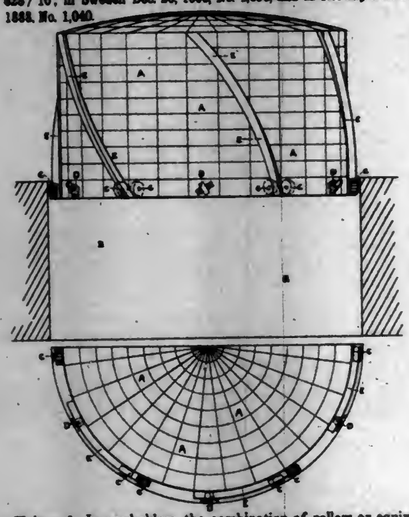
pivotal bearings at both its sides and adapted to be actuated from either side and to be raised at either side at option from a frame connected to the main frame of the car, and whereby the load may be discharged on either side, as desired, substantially as shown and described.

3. In combination with worm-wheel K, gear-wheel J, and drum I, the chains O O, connected to the trough B, having the pivots C C, as described.

405,701. **GAS-HOLDER.** WILLIAM GADD, Manchester, England. Filed Aug. 25, 1888. Serial No. 284,094. (No model.) Patented in England Oct. 6, 1887, No. 13,521, and in Luxemburg Aug. 13, 1888, No. 1,017.

Claim.—1. In gas-holders, the combination of rollers or equivalent friction-pieces, affixed to the lower curb or ring of the bell, with spiral guides on or in the face of the well or tank, substantially as herein set forth.

2. In gas-holders, the combination of tangential rollers or equivalent friction-pieces, affixed to the lower curb or ring of the bell, with



spiral guides on or in the face of the well or tank, substantially as herein set forth.

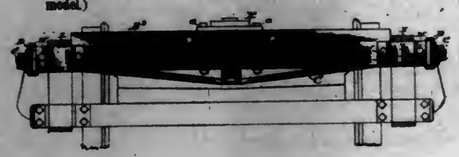
3. In gas-holders, the combination of angled radial rollers or equivalent friction-pieces, affixed to the lower curb or ring of the bell, with spiral guides on or in the face of the well or tank, substantially as herein set forth.

4. In gas-holders, the combination of both angled radial rollers and tangential rollers, or their equivalent friction-pieces, affixed to the lower curb or ring of the bell, with spiral guides on or in the face of the well or tank, substantially as herein set forth.

5. In telescopic gas-holders, the combination of rollers or equivalent friction-pieces, affixed to the lower curb or ring of an inner lift with spiral guides on the inner face of an outer lift, substantially as herein set forth.

405,702. GAS-HOLDER. WILLIAM GADD, Manchester, England. Filed Feb. 16, 1889. Serial No. 300,384. (No model.) Patented in England Oct. 6, 1887, No. 13,521; in Luxemburg Aug. 13, 1888, No. 1,017; in Belgium Aug. 16, 1888, No. 82,738; in Turkey Aug. 24, 1888; in Canada Aug. 28, 1888, No. 30,001; in Spain Sept. 27, 1888, No. 8,584; in France Oct. 6, 1888, No. 192,229; in New South Wales Oct. 9, 1888, No. 968; in Cape of Good Hope Oct. 11, 1888, No. 477; in Italy Oct. 13, 1888, No. 23,942; in Natal Oct. 17, 1888; in Tasmania Oct. 20, 1888, No. 6,278; in Brazil Oct. 31, 1888, No. 636; in Victoria Nov. 13, 1888, No. 628/10; in Sweden Dec. 20, 1888, No. 1,851, and in Norway Dec. 29, 1888, No. 1,040.

Claim.—1. In gas-holders, the combination of rollers or equivalent friction-pieces, affixed to the edge or wall of the tank or well, with spiral guides on the outer face of the bell, substantially as set forth.



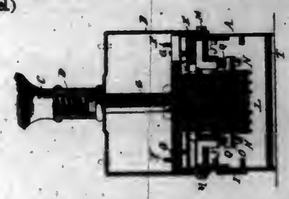
2. In gas-holders, the combination of tangential rollers or equivalent friction-pieces, affixed to the edge or wall of the tank or well, with spiral guides on or in the outer face of the bell, substantially as herein set forth.

3. In gas-holders, the combination of angled radial rollers or equivalent friction-pieces, affixed to the edge or wall of the tank or well, with spiral guides on or in the outer face of the bell, substantially as herein set forth.

4. In gas-holders, the combination of both angled radial rollers and tangential rollers or their equivalent friction-pieces, affixed to the edge or wall of the tank or well, with spiral guides on or in the outer face of the bell, substantially as herein set forth.

5. In telescopic gas-holders, the combination of rollers or equivalent friction-pieces, affixed to the inner face of an outer lift, with spiral guides on the outer face of an inner lift, substantially as herein set forth.

405,708. CAR-TRUCK BOLSTER. JOHN HIGGINSON, St. Louis, Mo. Filed Feb. 6, 1888. Renewed May 10, 1889. Serial No. 310,258. (No model.)



Claim.—1. A car-truck top bolster consisting of the arched metallic bars, the metallic tension-rod, the wooden bars, the center plate, and the bolster truss-seat, combined substantially as described.

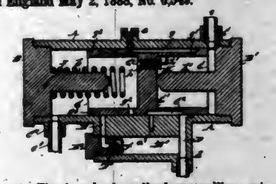
2. A car-truck top bolster having embodied within it an arched metallic truss, the center plate of the bolster resting directly upon the truss, substantially as described.

3. A car-truck top bolster having embodied within it an arched metallic truss, the center plate of the bolster resting directly upon the truss, and the truss extending beyond the vertical bearings of the bolster, substantially as described.

405,704. SELF-INKING BAND HAND-STAMP. BENJAMIN B. HILL, Philadelphia, Pa. Filed Feb. 27, 1888. Serial No. 265,357. (No model.)

Claim.—1. The combination, in a hand-stamp and with the yoke B and oscillating plate E therefor, of a regulating device, as the screws F, substantially as and for the purpose specified.

2. The combination, in a hand-stamp and with the frame A and the oscillating plate E therefor, of the screws G G, substantially as and for the purpose specified.

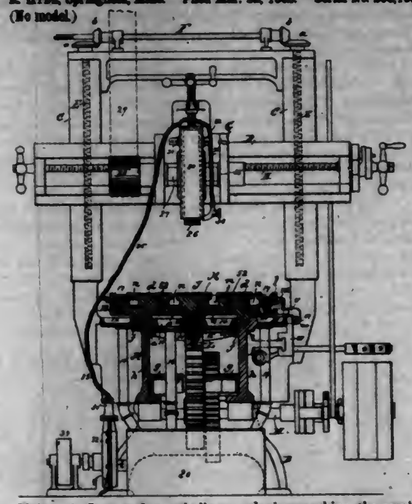


3. The combination, in a hand-stamp, of the oscillating plate E and the yoke B thereof with the frame A, having screws F G in its top, substantially as and for the purpose specified.

4. The combination, in a hand-stamp and with the band-drums thereof, of a plate E, pins N, rigidly connected with said plate, a shaft O, for supporting the drums, having holes to receive the pins, and springs around said pins N, acting against the shaft O, substantially as and for the purpose specified.

5. The combination, in a hand-stamp and with the yoke, the type-bands, and the drums therefor, of a plate E, castings J, attached thereto, provided with holes for the pivots of the yoke, and pins projecting at right angles to the plate to support the drums and their attachments, substantially as described.

6. The combination, in a hand-stamp, with a type-band, drum, and the shaft thereof, of a spring inserted in said drum and acting as a friction-surface between the drum and shaft, substantially as described.



405,705. AIR-BRAKE. FREDERIK A. HOLLEMAN, Oisterwyk, Netherlands. Filed Jan. 10, 1889. Serial No. 296,968. (No model.) Patented in England May 2, 1888, No. 6,549.

Claim.—1. The herein-described controlling-valve for air-brakes, comprising a cylinder A, having its ends closed with end pieces B B', formed upon their inner surfaces with inwardly-projecting abutments *b b'*, a pipe *c'*, in connection with the main supply-pipe, a pipe *c*, in connection with the auxiliary reservoir, an air-port D, a pipe *d*, in connection with the brake-cylinder, the air channel or passage E', communicating with the air-port E, a ball-valve F, closing this air-port, the channel *g*, formed in the upper part of the valve G, the exhaust-port *c'*, in the lower part of the casing, and the screw-pin projecting from the inner surface of the casing A, all substantially as and for the purposes hereinbefore set forth.

2. The combination, with the casing A and its connections, of the valve G, adapted to reciprocate within said valve-casing A, and consisting of a cylinder having a division G', a packing-ring g^2, encircling the periphery of said valve, a groove *g*, in which is adapted to slide the screw-pin *a*, the air-channel G^3, and the air-port g^2 in its under side, the air-port *g'* in its upper side, the air-port G^2 in the division G', said port G^2 being closed by the valve H, which is held open by the spring *h* and limited in its opening by the pin *h'*, and the spring I, fitted around the abutment *b*, all substantially as and for the purposes hereinbefore specified, and illustrated in the drawings hereunto annexed.

405,706. SURFACE GRINDING OR PLANING MACHINE. ELWIN R. HYDE, Springfield, Mass. Filed Mar. 22, 1888. Serial No. 268,160. (No model.)

Claim.—1. In a surface grinding or planing machine, the combination, with a bed having the uprights C, the horizontal slide-bar D, and the adjustable slide-block G, and a table adapted to be reciprocated on said bed, of a rotatable grinding-wheel journaled on said block, and a hood 30, supported on said block and nearly surrounding said grinding-wheel, substantially as described.

2. In a surface grinding or planing machine, the combination, with the stationary bed A, provided with the longitudinal side gutters 12 12, of the carriage movable on said bed provided with water-conducting passages therein and therethrough discharging into said side gutters of the bed, substantially as described.

3. A surface grinding or planing machine bed provided between its side walls with the longitudinal pan, substantially as described.

4. A planer-table comprising the intermediate platen portion *k* and the end pockets *p*, the said platen portion provided with the T-slots *n*, leading to said pockets, and the passages 18, leading downwardly from said T-slots through the table, substantially as described.

5. A planer-table comprising the intermediate platen portion *k* and the end pockets *p*, said platen portion having the T-slots *n*, leading to said pockets and the side gutters 17, and the passages 18, leading downwardly from said T-slots through the table, substantially as described.

6. A planer-table comprising the intermediate platen portion *k* and the end pockets *p*, said platen portion having the longitudinal side gutters 17, and a chute or gutter 50, leading laterally from said longitudinal gutters, substantially as described.

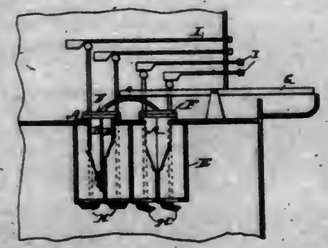
7. In a surface grinding or planing machine, the combination, with the bed thereof provided with the side troughs 12 12 and intermediate pan 14 and the slide-block G, of the rotatable grinding-wheel 26, the surrounding hood supported from said slide-block, the reciprocating table provided with the intermediate platen portion *k* and the end pockets *p*, said platen portion being provided with the T-slots *n*, in communication with said pockets, and having the passages 18, the tank 20, and pipes 19, leading from said troughs and pan thereto, a supplemental tank 23, and a conduit leading from the upper part of said tank 20 to said tank 23, a pump in communication with said tank 23, and a conduit extending from said pump to the grinding-wheel, substantially as and for the purpose set forth.

8. In a surface grinding or planing machine, the combination, with the bed thereof provided with the side troughs 12 12 and intermediate pan 14 and the slide-block G, of the rotatable grinding-wheel 26, the surrounding hood supported from said slide-block, the reciprocating table provided with the intermediate platen portion *k* and the end pockets *p*, said platen portion being provided with the side gutters 17 and the T-slots *n*, in communication with said pockets, and having the passages 18, the tank 20, and pipes 19, leading from said troughs and pan thereto, a supplemental tank 23, and a conduit leading from the upper part of said tank 20 to said tank 23, a pump in communication with said tank 23, and a conduit extending from said pump to the grinding-wheel, substantially as and for the purpose described.

9. In a surface grinding or planing machine, the combination, with the bed thereof provided with the side troughs 12 12 and intermediate pan 14, provided with the lip-surrounded aperture 15, the driving-gear journaled in bearings of the bed and projecting through said aperture 15, and the slide-block G, of the rotatable grinding-wheel 26, the surrounding hood supported from said slide-block, the reciprocating table provided with the intermediate solid platen portion *k* and the end pockets *p*, said solid portion being provided with the T-slots *n*, in communication with said pockets, and having the passages 18, the tank 20, and pipes 19, leading from said troughs and pan thereto, a supplemental tank 23, and a conduit leading from the upper part of said tank 20 to said tank 23, and a conduit extending from said pump to the grinding-wheel, substantially as and for the purpose described.

10. In a planing-machine, the combination, with the reciprocating table having the adjustable dogs *m m*, of the slide *w*, provided with the notch 42, the stud 40 screwing therein having the ear-pieces 44, and the abutment *v*, comprising the angularly-arranged arms 38 and 41, the former pivotally hung in the ear-pieces of said stud, and the latter adapted to be swung to rest in said notch 42, and to project into the line of travel of said dogs, and also to be swung out of such line of travel, substantially as shown and described.

405,707. FIRE-PLACE HEATER. THOMAS B. JACKSON, Belmont, Ohio. Filed June 8, 1888. Serial No. 276,450. (No model.)



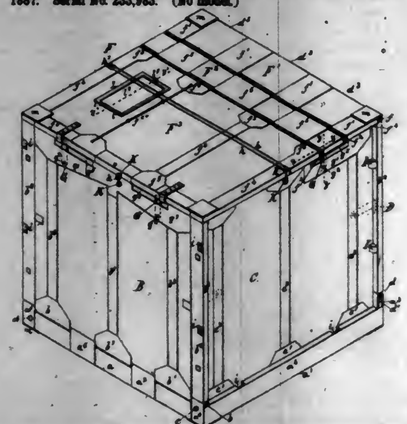
Claim.—1. In a fire-place heater, the combination, with the hot-air chambers K^2, K^3, K', and K, arranged to inclose a fire-chamber, the hot-air chamber K being directly above the fire-chamber and closed in on every side and communicating with the hot-air chamber K', of the cold-air pipe leading directly to the hot-air chamber K, substantially as and for the purpose described.

2. The herein-described fire-place heater composed of the front, the end, and the rear hot-air chambers K^2 and K', respectively, inclosing the fire-chamber, the hot-air chamber K, arranged directly over the top of the fire-chamber and communicating with the rear hot-air chamber, the cold-air pipe passing through the rear chamber K' and extending into the chamber K, and the cold-air register communicating with the said cold-air pipe, substantially as and for the purpose described.

3. In a fire-place heater having end, rear, and top hot-air chambers arranged to form walls and inclose the fire-chamber, the combination of the hot-air chamber K, arranged in the top hot-air chamber, the metal end plates O O, and the metal top plate P, extending over the fire-chamber and part way down in the rear of the fire-chamber, substantially as and for the purpose described.

405,708. REED-ORGAN. HENRY JAHN, Waterbury, Vt. Filed Aug. 16, 1888. Serial No. 283,577. (No model.)

Claim.—1. A reed-tube B, formed from a sheet-metal blank B', open at one end and flanged, closed at the other end and having an escallot in one side, and the single vibrating reed D, secured to the tube and operating over the escallot, substantially as set forth.



2. The combination, with a wind-chest, of reed-tubes secured in the said wind-chest and provided with vibrating reeds operating over escallots in the said tubes, and a valve operated by keys and held

on the open end of each of the said tubes, substantially as shown and described.

3. The combination, with a wind-chest and a resonating-channel, of reed-tubes secured in the said wind-chest and provided with vibrating reeds operating over eschallots in the said tubes, said tubes opening into the said resonating-channel, substantially as shown and described.

4. The combination, with a wind-chest and a resonating-channel, of reeds or reed-tubes secured in the said wind-chest and provided with vibrating reeds operating over eschallots in the said tubes, said tubes opening into the said resonating-channel, and a valve operated by keys and held over a wind-vent in the said resonating-channel, substantially as shown and described.

405,709. FOLDING PACKING-BOX. HENRY JOHNSON, Washington, D. C., assignor to Bendeen J. Behrend, same place. Filed Apr. 7, 1887. Serial No. 233,983. (No model.)

Claim.—1. In the described folding packing-receptacle, the combination, with the sides and ends B C D E, of the lugs I and notches *i*, substantially as and for the purpose described.

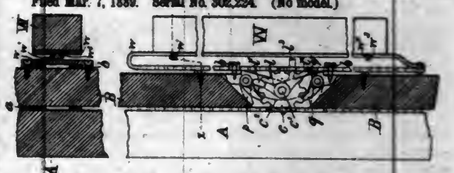
2. The packing-receptacle comprising folding-sections A B C D E F, hooks G, hook-holding plates, slotted strengthening plates, and lugs I, said hooks being applied on the sides and ends of the receptacle and accessible at points near its top, substantially as and for the purpose described.

3. The packing-receptacle comprising folding sections A B C D E F, hooks G, hook-holding plates, slotted strengthening-plates, lugs I, and pins J, substantially as described.

4. The packing-receptacle comprising folding sections A B C D E F, hooks G, hook-holding plates, slotted strengthening-plates, fastening K *k'*, and wire *k*, substantially as described.

5. In the described folding packing-receptacle, the combination, with the front board B and top portion F^3, of hooks G, pin J, and a fastening K *k'* for a wire *k*, substantially as and for the purpose described.

405,710. CAR-WHEEL. WILLIAM JOSLIN, Cleveland, Ohio. Filed Sept. 7, 1888. Serial No. 284,844. (No model.)



Claim.—1. A wheel having a tire and center parts or body with double opposing angular surfaces or bearings projecting outward from an approximately central internal flange of the tire secured by means of bolts, the opposing angular surfaces or bearing parts of the wheel-body being constructed with greater diameters in the plane of the surfaces or bearings on both sides of the central inner projecting flange of the tire, said difference of said diameters normally creating open spaces between said parts of said wheel-body and both sides of said inner projecting flange *o* of said tire, the joining faces *a a'* and *c d'* of said tire and wheel-body being counterpart inclines to each other, said parts being adapted to permit the drawing of said parts of the wheel-body together by said bolts in wedge movement toward said internal flange of said tire, by which operation the tire and wheel-body are drawn firmly together and any looseness of the wheel is remedied, substantially as set forth.

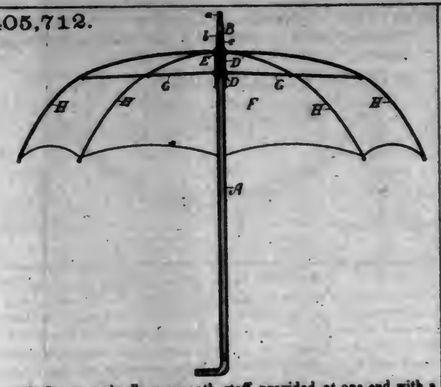
2. The combination, with the tire having an inner projecting flange, the tire and flange having corresponding oppositely-inclined bearing-faces, of the central portion composed of two parts, each having two sets of bearing-faces which correspond with and fit against the bearing-faces on one-half of the tire, and having spaces between the opposing sides of the said parts and the sides of the said flange, and the bolts for drawing the said parts together, substantially as set forth.

3. The combination, with the tire having grooves in its sides, and having an inner projecting flange, the tire and the flange having oppositely-inclined bearing-faces, of the central portion composed of two parts, each having bearing-faces to correspond with and fit against the bearing-faces on half of the tire, and having a flange to fit in the groove in the side of the tire, spaces being left between the opposing sides of the said parts, flange, and tire, substantially as shown, and the bolts for securing the parts together, substantially as described.

405,711. SASH-BALANCE. WILLIAM KADOW, Jr., Newark, N. J. Filed Mar. 7, 1889. Serial No. 302,224. (No model.)

Claim.—1. The combination, with the window-sash provided with a rack upon one edge extending over its entire length, a similar rack arranged to slide within the casing on the side adjacent to the window-sash and supporting a counter-balance of greater weight than the sash, and a pinion mounted upon the window-frame intermediate to the said racks, of a pawl pivoted upon the window-frame above the pinion, a bell-crank pivoted upon the axle of the pinion having one of its arms adapted to engage the pawl to lift it out of engagement with the pinion, and a lever pivoted upon and operated from without the window-frame to lift the other arm of the bell-crank, substantially as shown and described.

2. In a sash-lifting device comprising racks *a* and *w*, applied to the edges of the sash A, and the counter-balance W, and an intermediate pinion *c*, mounted upon the window-frame, the combination, with the pinion, of the pawls *p* and *q*, arranged to engage with the same, the pawl *q* being provided with a toe *q'* projecting therefrom, as described, a bell-crank having arms l', l^3, and l^3, and a lever *n*, pivoted upon the window-frame, one of its ends projecting without the said frame and the other end engaging with the arm l^3, substantially as shown and described.

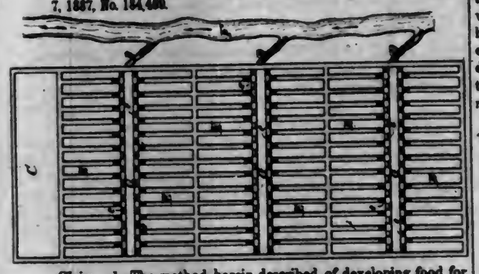


3. In a sash-lifting device comprising racks *a* and *w*, applied to the edges of the sash A, and the counter-balance W, and an intermediate pinion *c*, mounted upon the window-frame, the combination, with the pinion, of the pawls *p* and *q*, arranged to engage with the same, the pawl *q* being provided with a toe *q'* projecting therefrom, as described, arms l', l^3, and l^3, a lever *n*, pivoted upon the window-frame, one of its ends projecting without the said frame and the other end engaging with the arm l^3, and a plate *r*, pivoted at one end upon the frame and provided with slots *s* and *s'* open at one side of the said plate, the whole arranged and operated as and for the purpose set forth.

4. In a sash-lifting device, the combination, with the sash provided on one edge with a rack extending over its entire length, and a pinion pivoted upon the window-frame and engaging therewith, of a rack-bar secured to slide within the casing to engage with the pinion and supporting a counter-balance of greater weight than the sash, the said rack-bar consisting in a strip of sheet metal provided with a series of transverse slots upon one end to form the rack portion, and its other portion being bent parallel thereto and provided with means for attaching the counter-balance thereto, substantially as shown and described.

405,712. UMBRELLA. GEORGE A. KITTREDGE and WATSON P. KILBOURNE, Chicago, Ill. Filed Sept. 27, 1888. Serial No. 286,556. (No model.)

Claim.—1. In a combination cane-umbrella, a plain staff provided with a single one-piece fastening-screw at one end, in combination with an umbrella-head centrally tapped to engage with said screw, and a ferrule provided with an internal screw-thread, whereby the said ferrule may be held on the said fastening-screw either with or without the said head, substantially as described.



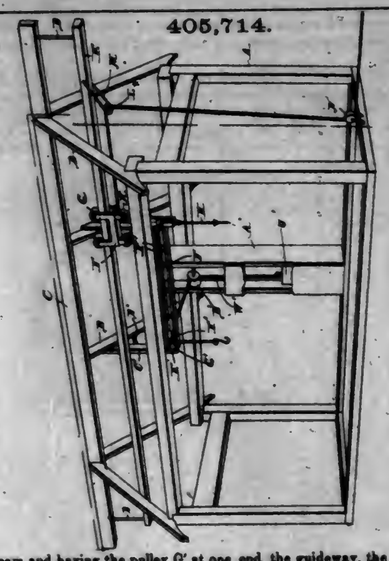
405,712.

2. In an umbrella, a smooth staff provided at one end with a single one-piece fastening-screw having an enlarged threaded central portion *c'*, in combination with a head centrally tapped to engage with the part *c'*, the umbrella-frame pivotally secured to said head, and a ferrule provided with a screw-thread, whereby the said ferrule may be held on the said fastening-screw either with or without the umbrella-head, substantially as and for the purposes described.

3. In an umbrella, a smooth staff A, provided with the single one-piece fastening-screw c^3 *c' c*, in combination with the head E, having the frame of the umbrella pivotally secured thereto, and the ferrule B, provided with the centrally-tapped interior plug *b*, constructed and arranged substantially as and for the purposes described.

405,713. METHOD OF PRODUCING FOOD FOR FISH. FRANÇOIS LUSERN and EDOUARD DU ROVERAY, Geneva, Switzerland. Filed Feb. 10, 1888. Serial No. 263,614. (No model.) Patented in France Nov. 7, 1887, No. 184,499.

Claim.—1. The method herein described of developing food for fish and feeding the same, consisting in providing two or more ponds, passing the fish from the first pond to the second, allowing the excrement to remain and develop animalculæ, and returning the fish to the first pond to feed on the animalculæ while the animalculæ are developed in the second pond, and then repeating the operation, substantially as specified.



2. The method herein specified of developing food for fish and feeding and caring for such fish, consisting in separating the fish into groups according to their approximate size and keeping the same in sets of small communicating ponds or pools, passing the fish periodically from one set of pools to another and allowing the empty set of pools to remain for the development of animalculæ from the excrement contained therein, and feeding the fishes thereon in one set of pools while the animalculæ are developed in the other set of pools, substantially as specified.

3. The method herein described of developing food for fish and feeding the same, consisting in providing two or more tanks or ponds, passing the fish from the first to the second, removing the excrement from the first tank, heating said excrement to promote decomposition and returning it to the first tank, darkening the tank and allowing the excrement to remain and develop animalculæ, returning the fish to said first tank to feed on the animalculæ, then treating the excrement of the second tank, as described, with reference to the first tank, and then returning the fish to feed on the animalculæ developed in the second tank, substantially as specified.

405,714. HAY-CARRIER. THEODORE MILAR and HENRY PEYTON-ARD, Atkinson, Ill. Filed Oct. 4, 1888. Serial No. 287,148. (No model.)

Claim.—1. The combination of the track-beam, the carrier thereon, the pulley L at one end of the beam, the frame C below the beam and having the pulley G' at one end, the guideway, the pulley B' at the upper end thereof, the weight in said guideway, and the rope attached thereto, passed around pulleys B' and G', and attached to the carrier, substantially as described.

405,714.

2. The combination of the track-beam, the carrier thereon, the pulley L, and link to attach the same to either end of the track-beam, the frame C, adapted to be suspended from the barn-roof and provided with the pairs of openings F' at opposite ends, the pulley G', having the bolt H', adapted to be secured in said openings at either end of the frame, the vertical guideway A', the pulley B' at the upper end thereof, the rope passed over said pulley, around pulley G', attached to the carrier, and the weight in the guiding-trough secured to said rope, substantially as described.

405,715. MUSIC STAND AND PORTFOLIO. VIOLA MOORE, San Francisco, Cal. Filed Nov. 6, 1888. Serial No. 290,128. (No model.)

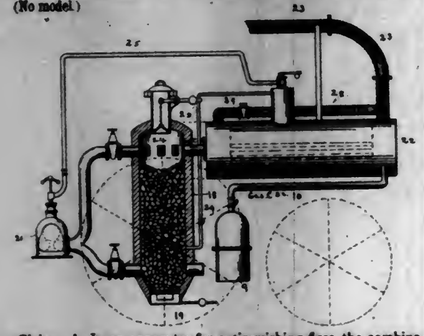
Claim.—1. A music-receptacle comprising the box or drawer having laterally-projecting arms and a rod designed to be secured beneath a piano, said box or drawer being vertically adjustable on the rod and adapted to be swung around the same, the outer end of the box being hinged, substantially as described.

2. A music-receptacle comprising the box or drawer having laterally-projecting arms, a plate designed to be secured to a piano, and a rod swiveled to the plate and depending therefrom, said box or drawer being vertically adjustable on the depending rod, substantially as described.

3. A music-receptacle comprising a box or drawer having laterally-extending arms provided with eyes or openings, a plate designed to be secured to a piano, and a rod depending from said plate and passing through the eyes or openings of the lateral arms, said rod being threaded and provided with an adjusting-nut, substantially as described.

405,716. METHOD OF CLEANING METAL CASTINGS. JOSEPH H. POPE, Philadelphia, Pa. Filed Mar. 15, 1888. Serial No. 267,260. (No specimens.)

Claim.—1. The method of removing sand and other foreign matter from metal castings without injury to their original or chilled surfaces, which consists in subjecting the castings to a bath of hydrofluoric acid and cold water and then to a bath of water, substantially as set forth.



2. The method of removing sand and other foreign matter from metal castings without destroying their original or chilled surfaces,

which consists in subjecting the castings to a weak solution or bath of hydrofluoric acid and then to a bath of hot water, substantially as set forth.

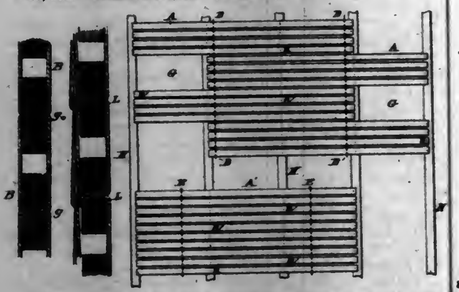
3. The method of preparing the surfaces of metal castings for electro or other plating or coating, consisting in first subjecting the casting to a weak solution or bath of hydrofluoric acid and cold water to remove sand and foreign matter from the surfaces of the castings, and then subjecting them to a bath of hot water, substantially as set forth.

405,717. PORTABLE APPARATUS FOR EXTINGUISHING FIRES.

HENRY C. REW, Chicago, Ill. Filed Sept. 25, 1888. Serial No. 286,377. (No model.)

Claim.—1. In an apparatus for extinguishing fires, the combination of the furnace provided with means, such as a blower, for producing a regulable blast at the base of the fuel and also above the same in a combustion-chamber, with a steam-generator and a flexible delivery-pipe having a non-conducting covering to conduct the products of combustion to a fire, substantially as specified.

2. In an apparatus for extinguishing fires, the combination of the furnace provided with means, such as a blower, for producing a regulable blast at the base of the fuel and also above the same in a combustion-chamber, with a steam-generator and a flexible delivery-pipe having a non-conducting covering to conduct the products of combustion to a fire, substantially as specified.



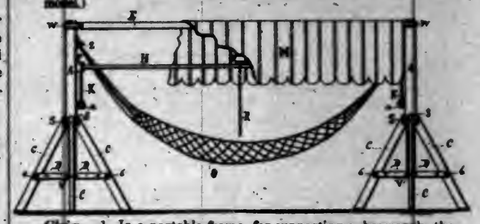
3. In an apparatus for extinguishing fires, the combination of the furnace with the steam-boiler, the blower, a pipe to conduct steam to the base of the fuel-chamber, and a pipe to conduct extinguishing-gases from the boiler-flues to a fire, substantially as specified.

4. In an apparatus for extinguishing fires, the combination of the furnace with the blower, the steam-boiler having flues for products of combustion, a flue to conduct a portion of the products by the boiler, and a covered pipe to conduct the extinguishing-gases to a fire, substantially as specified.

5. In an apparatus for extinguishing fires, the combination of the furnace with the blower, the steam-boiler having flues for products of combustion, a flue to conduct a portion of the products by the boiler, a distinct gas-generator to supply additional extinguishing-gas, and a covered pipe to conduct the extinguishing-gases to a fire, substantially as specified.

405,718. LATHING.

LAUREN S. SCOTT, Bristol, Vt. Filed Feb. 23, 1888. Serial No. 265,005. (No model.)

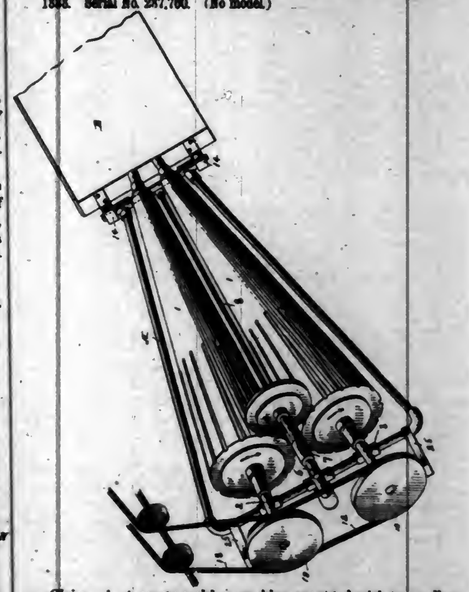


Claim.—1. A lathing fabric composed of parallel wooden strips arranged in proper position to be nailed in place and sewed together with twine or thread, the stitches passing through the bodies of the strips, as specified.

2. A lathing fabric composed of lathing-strips of any suitable material stitched together, substantially as specified.

405,719. HAMMOCK AND CANOPY SUPPORT.

HERVEY SIGLER, New York, N. Y. Filed Dec. 12, 1888. Serial No. 292,559. (No model.)



Claim.—1. In a portable frame for supporting a hammock, the combination, with the standards A, provided with shoulders at 3, 4, and 5, of the rings S, bearing against the shoulders 3, the legs C, pivotally connected to said rings S, the rings V, bearing against the shoulders 4, and the braces D, having one of their ends pivotally connected to the rings V and their other ends removably connected to the legs C, the connecting-pole E, passing from the top of one standard to the other, and the straps or loops W, pivoted to the connecting-pole near each end, by which the pole E is secured to the standards, substantially as set forth.

2. The combination, with the standards A, provided with shoulders at 3, 4, and 5, of the legs C and rings S, the upper ends of such legs being pivotally connected to such rings S and said rings S bearing against the shoulder 3, the braces D, each having one end bifurcated to receive the legs C and removably connected to such legs C, and the rings V around the standards and resting against the shoulder 4 near the lower ends of such standards, such rings V having projections forming sockets on their outer surfaces, into which sockets one end of each of the braces D is pivotally secured, the pole E, having bifurcated ends resting upon the shoulders 5 on the standards A, near the top of such standards, and the loops or straps W, pivotally fastened to the pole E near each end and adapted to be passed over the top of the standards to hold the pole E to the standards, substantially as specified.

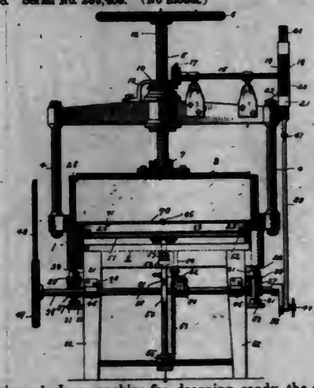
405,720. MACHINE FOR MAKING STICK-CANDY.

JOHN SMITH, Norristown, assignor to Croft & Allen, Philadelphia, Pa. Filed Oct. 10, 1888. Serial No. 287,760. (No model.)

Claim.—1. A candy-making machine provided with two rollers arranged side by side, geared to revolve in the same direction, and inclined from a horizontal line, and an end bearing arranged above the rolls at their lower ends, substantially as and for the purpose set forth.

2. The combination of the inclined revolving rolls and a bearing consisting of a revolving plate arranged above and between the rolls adjacent to their lower ends, substantially as set forth.

3. The combination of a pair of tapering inclined rolls geared to revolve in the same direction, with their smaller ends elevated, and a bearing-plate in the form of a disk supported above the lower ends of the rolls, substantially as set forth.



4. The combination of a pair of separated revolving rolls, a bearing above the same at their lower ends, and a burner arranged below the space between the rolls, substantially as set forth.

5. The combination, with a table, of a frame hung to the table and supporting in an inclined position a pair of revolving rolls and a bearing above the rolls, substantially as set forth.

6. The combination of the frame supporting a pair of inclined revolving rolls and bearing above the rolls, a burner below the rolls, and a detachable table C, substantially as and for the purpose set forth.

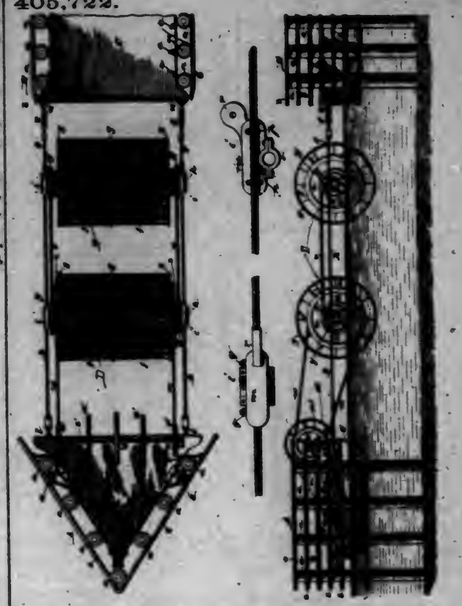
405,721. MACHINE FOR MAKING DROP-CANDY.

JOHN SMITH, Norristown, assignor to Croft & Allen, Philadelphia, Pa. Filed Oct. 29, 1888. Serial No. 289,408. (No model.)

Claim.—1. In a machine for dropping candy, the combination, with the stationary frame, of a movable receptacle having a perforated bottom, a movable receiving-plate below the receptacle, an adjustable follower in the receptacle, an intermittingly-operated driver for the follower, and a shaft connected to intermittingly operate the receptacle and the plate, substantially as set forth.

2. The combination, in a machine for dropping candy, of a vertically-movable receptacle having a perforated bottom, a follower within the receptacle, a plate below the receptacle, vertically movable toward and from the receptacle, a driver for intermittingly moving the follower, and a shaft connected with the receptacle and with the plate for raising and lowering them independently of the follower, substantially as set forth.

3. The combination, with the receptacle 26, of a follower, a slotted feeding-screw and driving-pinion, a fixed nut adapted to said screw, a shaft gearing with said pinion and provided with a ratchet engaging with a pawl carried by a toothed wheel upon said shaft, and a reciprocating rack engaging with said toothed wheel, a crank-shaft connected with said rack and provided with cams and connections for elevating and lowering the receptacle, substantially as set forth.



4. The combination, with the receptacle 26, having a perforated bottom, of a plate 53, a supporting-rod 49, connected with the plate, a lever connected with said rod through the medium of a spring, and a revolving cam bearing upon said lever, substantially as set forth.

5. The combination of a reciprocating receptacle having a perforated bottom, a reciprocating receiving-plate having a movement greater than the movement of the receptacle, a stop for the plate carried by the receptacle, a lifting-bar connected with the receiving-plate, a driving-shaft, and yielding connections between the driving-shaft and the said bar, substantially as and for the purpose set forth.

6. The combination of the vertically-movable receptacle, the plate 51, supporting-bar 49, a lever connected to said bar by a spring, and a shaft provided with a cam arranged to engage with said lever, substantially as set forth.

405,722. SURFACE-CURRENT OR TIDE MOTOR.

EDMUND SOULOW, Buffalo, N. Y. Filed Jan. 2, 1888. Serial No. 295,173. (No model.)

Claim.—1. A current or tide motor consisting of two open piers, movable platforms in said piers, and a floating wheel or wheels interposed between the piers, in combination with suitable means for transmitting the power of the motor, substantially as described.

2. A current or tide motor consisting of an open pier, a movable platform secured and guided in the pier by wheels bearing against the pier, and a floating wheel secured to the pier, in combination with suitable means for transmitting power from the motor, substantially as described.

3. A current or tide motor consisting of an open triangular pier, an open parallel pier, platforms in said piers, and a floating wheel between the piers supported on cables attached to the platforms, substantially as described.

4. A current or tide motor consisting of piers and a floating wheel suspended upon cables by means of sliding journal-bearings secured to the cables, substantially as described.

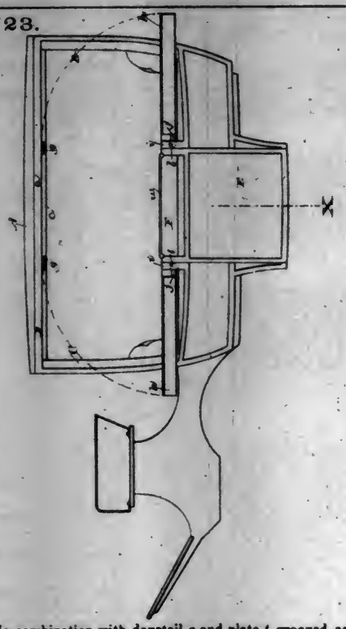
5. A current or tide motor consisting of open piers, vertically-adjustable platforms, and a floating wheel secured to the piers by means of a flexible connection, in combination with suitable means for transmitting power from the motor, substantially as described.

6. A current or tide motor consisting of open piers, platforms secured to the piers, and a floating wheel, in combination with cables for supporting the wheel, and a device for stretching the cables, substantially as described.

7. In a current or tide motor, a floating wheel supported upon cables, in combination with sliding journal-bearings provided with a clamping device for securing the wheel in position upon the cables, substantially as described.

405,723. CARRIAGE.

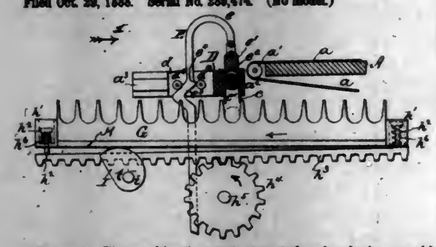
CHAUNCEY THOMAS, Boston, Mass. Filed Feb. 13, 1889. Serial No. 299,706. (No model.)



Claim.—1. In a carriage of the general class described, the combination of a top having permanent supports at the ends thereof, falling pillars hinged to the body and arranged to be secured to said top when raised, and removable side glasses arranged to close the space between the permanent lower portion of the body and said top, substantially as specified.

2. As an improvement in coach-tops, the top rail thereof formed with the outer and inner portions *a b* of wood, and the thin metallic bar *c*, interposed therein and arranged to serve as the partition or stop of the glasses, substantially as specified.

3. In combination with the falling pillars and top, the dovetail *g*, having both transverse and lineal oblique faces, and plate *i*, having a groove to receive said dovetail, substantially as specified.



405,723.

4. In combination with dovetail *g* and plate *f*, grooved, as specified, the locking-screw *i*, combined and arranged as specified.

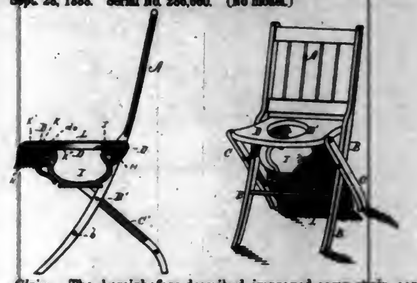
405,724. CIGAR-MACHINE. JOHN THOMPSON, Philadelphia, Pa. Filed Oct. 29, 1888. Serial No. 289,474. (No model.)

Claim.—1. The combination of the bunch-forming device, a mold-block, feed mechanism therefor, conveyer-flights, the ends of which enter the molds in said block to deliver the bunch, and mechanism for alternately separating and joining the molds and conveyer-flights, substantially as set forth.

2. In a cigar-making machine, the combination of a bunch-forming device, a mold-block, feeding mechanism therefor, conveyer-flights comprising a fixed and a movable flight between the bunch-forming device and the mold-block, the ends of the conveyer-flights entering the molds in said block to deliver the bunch, a plunger passing between said conveyer-flights, and mechanism for actuating said plunger and for alternately separating and joining the molds and conveyer-flights, substantially as set forth.

3. In combination with a cigar-bunch-forming device, the fixed and movable conveyer flights or sides *c c'*, a plunger passing between said flights and actuating said movable flight, a receiver or mold-block for the bunches, and actuating devices for engaging the ends of the flights or sides *c c'* with the molds in the receiver or block, substantially as set forth.

4. In a cigar-machine, the combination of fixed and movable conveyer-flights *c c'* and plunger-bars E, in engagement with and actuating the movable conveyer-flight *c'*, substantially as set forth.



5. In a cigar-machine, the combination of a mold-block, fixed and movable conveyer-flights *c c'*, the ends of which enter the molds in said block to deliver the bunch, a plunger passing between said flights, actuating mechanism for said plunger, and mechanism for feeding the mold-block and for alternately separating and joining the molds in said block and the conveyer-flights, substantially as set forth.

6. In a cigar-machine, the combination, with a bunch-forming device, of the fixed and movable conveyer-flights *c c'*, plunger-bars E, engaging with and controlling the movements of said movable conveyer-flights, a plate H, a rack-bar A^2, having spring-supports on said plate, a mold-block loosely supported on said plate, feeding mechanism for the plate, and actuating devices for raising said mold-block, substantially as set forth.

7. In a cigar-making machine, the combination of a bunch-forming device, the fixed conveyer-flight *c*, the movable conveyer-flight *c'*, having rollers d^{11} d^{12}, the plunger-rods E E, having cams e^3 and recesses e^4, and actuating mechanism for said plunger-rods, substantially as set forth.

8. In a cigar-making machine, the combination of plate H, having end lugs A, mold-block G, loose on said plate, guides or ways for said plate, rack-bar A^2, spring supported on plate H, and actuating mechanism in engagement with said rack-bar, and lifting-cams I in engagement with plate H, substantially as set forth.

405,725. CAMP-CHAIR. LUCIUS R. TRUMBELL, Bristol, N. H. Filed Sept. 28, 1888. Serial No. 286,660. (No model.)

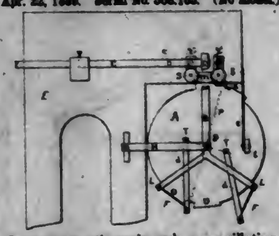
Claim.—The hereinbefore-described improved camp-chair, consisting, essentially, of the back A, hinged legs B B C C, hinged seat D, provided with the opening *D'*, and flexible seat-cover L, secured at its rear corners to the legs C, and provided on its under side with the front piece N, whereby a pocket is formed, into which the front edge of the seat slips when it is lowered, substantially as and for the purpose set forth.

405,726. SPOOL OF THREAD FOR SEWING-MACHINES. GEORGE H. WILKINS, Shelburne Falls, Mass. Filed July 2, 1888. Serial No. 306,949. (No model.)

Brief.—The object of the invention is to form a spool of thread so that the thread will draw off easily, and so that each layer of thread will be entirely covered by each succeeding outer layer, so that there will be but one layer exposed at a time.

Claim.—1. A conical spool of thread or silk the courses or layers of which increase successively in length from the inner portion thereof outward throughout the entire body of thread, whereby each course or layer is entirely covered by each succeeding outer course or layer, substantially as and for the purpose set forth.

2. A conically-wound spool of thread consisting of a spool proper having a stem or body and a flanged base and of thread or silk in substantially close coils on the spool-body, the courses or layers of thread or silk increasing successively in length from the inner portion of the spool outward throughout the entire body of thread, substantially as and for the purpose set forth.



3. The spool consisting of the stem *a*, the flanged base *b*, the thread in close coils on the spool, the first or foundation course consisting of a few coils on the spool at the junction of the stem *a* with the base *b*, and each succeeding course extending a short distance beyond the preceding course toward the base and a greater distance beyond each preceding course toward the tip or end, whereby a spool of thread having substantially the form of a frustum of a cone is formed, as set forth.

405,727. SHOE-NAIL. LLOYD W. AUSTIN, Milwaukee, Wis. Filed May 26, 1888. Serial No. 275,092. (No model.)

Claim.—A nail consisting of a head, a shank of uniform diameter throughout its length, a long conical point tapering with uniform pitch from the surface of the shank to the extremity of the nail, and three or more re-enforcing ribs of equal size integral therewith on the conical point, extending from the shank downwardly upon and along the surface of the point a portion of its length, each rib terminating in a vanishing point a distance from the point of the nail, leaving a plain clinching-point below said ribs, substantially as and for the purpose set forth.

405,728. AUTOMATIC GRAIN-SCALE. JOHN H. FORSTER, Fargo, Dak. Filed Apr. 22, 1889. Serial No. 308,163. (No model.)

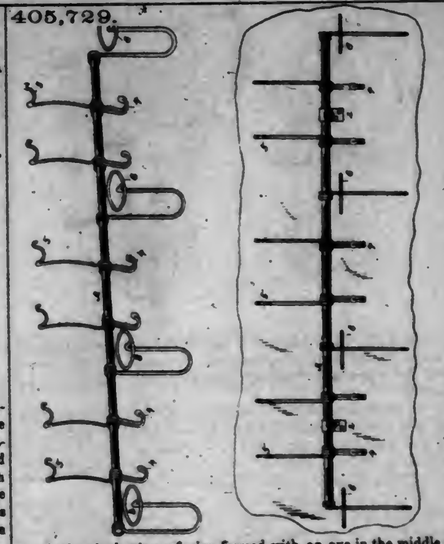
Claim.—1. In an automatic grain-scale, an oscillating weighing-box pivotally supported between hanger-arms suspended from the arm of a scale-beam and provided with oppositely-arranged compartments intended to alternately receive and discharge the grain, and also provided with a wheel K, pivoted thereto, in combination with two separate wheels S S on the frame, adapted to alternately engage the wheel K, and a block or projection M, located between the wheels S S, to prevent the wheel K from being accidentally caught between them, substantially as herein described.

2. In an automatic grain-scale, the double-compartment box A, pivotally supported between hanger-arms suspended from a scale-beam and provided with an automatic detent, in combination with discharge-port covers having their outer edges hinged or pivotally connected with the lower ends of the hanger-arms, or the rods connecting the same, and their inner edges supported by links pivoted to the oscillating box in such a manner that said covers will swing and operate concurrently with the oscillation of the box, substantially as herein described.

3. In an automatic grain-scale, the oscillating box A, pivoted in hanger-arms B B, suspended from a scale-beam and provided with a detent, in combination with swinging port-covers pivotally connected with the hanger-arms and supported by links *d d*, suspending from the box, said links being so adjusted that the covers will swing simultaneously with the oscillating of the box, substantially as herein described.

4. In an automatic grain-scale, a double-compartment oscillating box pivotally suspended between hanger-arms connected at their upper ends with a scale-beam, in combination with discharge-port covers connected at their outer edges directly or indirectly with the hanger-arms and having the inner edges suspended and supported by links pivotally connected with the weighing-box, substantially as herein described.

5. In an automatic grain-scale, a double-compartment oscillating weighing-box suspended between hanger-arms connected at their upper ends to a scale-beam fulcrumed on the head of an elevator, in combination with guide-bars H H, pivotally connecting the elevator with the hanger-arms below the scale-beam, and the guard-rollers *l l*, pivoted to brackets extending from the elevator, said guard-rollers being so adjusted that the tendency of their motion will coincide with the oscillating and vertical motion of the box, substantially as herein described.



6. In an automatic grain-scale, the combination of an oscillating double-compartment box A, pivoted in hanger-arms B B, suspended from a scale-beam, discharge-port covers pivotally connected at their outer edges with the hanger-arms and suspended at their inner edges by links pivoted to the box, the guide-bars H H, and guard-rollers *l l*, substantially as herein described.

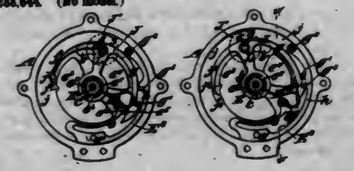
405,729. HAT AND COAT RACK. CHARLES T. GARDNER, Oswego, N. Y., assignor to Frances Emily Gardner, same place. Filed Sept. 22, 1887. Serial No. 250,388. (No model.)

Claim.—1. As an improved article of manufacture, the herein-described hat and coat rack, consisting of a straight supporting-rod A, the garment-supporting hooks 4, formed of a single wire having one end wrapped about the supporting-rod, then formed into a hook, and the free end then wrapped about the supporting-rod and the strand carried up and formed into an umbrella-support 5, and the hat-supports 6, consisting of a wire having one end wrapped about the supporting-rod and the strand carried down and up and the free end formed into a ring or seat, substantially as and for the purpose specified.

2. The garment-hook and umbrella-support herein described, composed of a single piece of wire formed with an eye in the middle to take a horizontally-arranged supporting-rod, and having a depending garment-hook and a vertically-arranged umbrella-support, substantially as described.

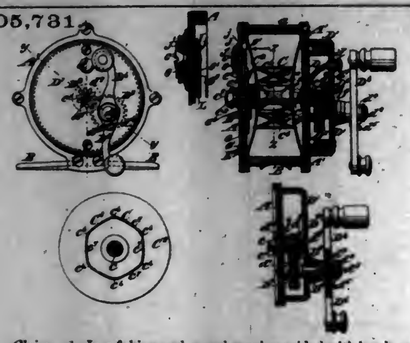
405,729.

405,730. SEAL. CHARLES A. GILDEMEYER, Haddonfield, N. J., assignor to himself, and Madison Rush, Philadelphia, Pa. Filed Apr. 6, 1889. Serial No. 306,150. (No model.)



Claim.—1. A seal consisting of a plate A, having a projecting rim *a'* cut away at a^3, in combination with a face-plate B, of less thickness than the rim *a'*, and a wire B, having a looped end *b* and legs *b'*, with enlarged ends, all substantially as and for the purpose specified.

2. A seal consisting of a plate A, having a projecting rim *a'* cut away at a^3, one or more longitudinal grooves a^3, and an opening in the rim at the end of said grooves, in combination with face-plate B, of less thickness than the rim *a'*, and a wire B, having a looped end *b* and legs *b'*, with enlarged ends, all substantially as and for the purpose specified.



3. A seal consisting of a plate A, having a projecting rim *a'* cut away at a^3, in combination with a face-plate B, having a turned-up rim *c'* of less thickness than the rim *a'*, and a wire B, having a looped end *b* and legs *b'*, with enlarged ends, all substantially as and for the purpose specified.

4. A seal consisting of a plate A, having a projecting rim *a'* cut away at a^3, one or more longitudinal grooves a^3, and an opening in the rim at the end of said grooves, in combination with face-plate B, having a turned-up rim *c'* of less thickness than the rim *a'*, and a wire B, having a looped end *b* and legs *b'*, with enlarged ends, all substantially as and for the purpose specified.

405,731. FISHING-REEL. PETER G. GIBSON, New York, N. Y., assignor to Thomas R. Mills, same place. Filed Oct. 20, 1888. Serial No. 288,644. (No model.)

405,731.

Claim.—1. In a fishing-reel, a reel-spool provided with heads and a barrel, the said barrel being composed of substantially parallel crossbars and intermediate diagonally-extending braces, substantially as specified.

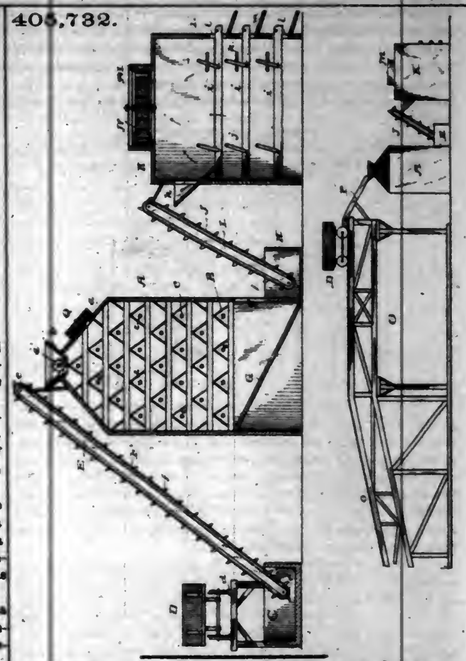
2. In a fishing-reel, the combination, with a reel-spool, of a spindle upon which said spool is mounted, heads for the reel, a box secured to one of said heads, and a tube extending to the exterior of said box and in close proximity to one of the journals of said spindle for supplying oil to said journal, substantially as specified.

3. In a fishing-reel, the combination, with a spool, of a spindle upon which said spool is mounted, a pinion on said spindle, a shaft, a second pinion on said shaft engaging the pinion first named, and a washer on the spool-spindle operating to maintain the first-named pinion in position and to overlap the pinion last named, substantially as specified.

4. In a fishing-reel, the combination, with a hollow shaft, of a pinion on said shaft, a stud about which said shaft may turn, a handle, and a cap securing said handle in position on the shaft and inclosing the outer ends of the shaft and studs, substantially as specified.

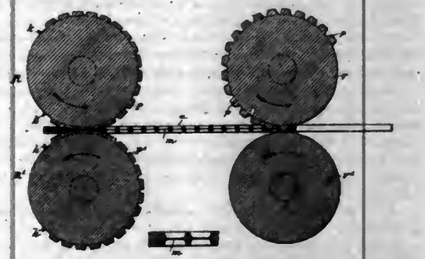
5. In a fishing-reel, the combination, with a shaft and a handle, of a cap inclosing the outer end of the shaft, and a lock on the handle adapted to engage said cap to prevent its removal, substantially as specified.

6. In a fishing-reel, the combination, with a spool, of a click-wheel, a click-spring, a resilient arm upon which said click-spring is mounted, a drag-arm, and a single cam adjacent to the drag and the click-spring and adapted to be rotated so as to alternately operate the click and the drag, substantially as specified.



7. In a fishing-reel, the combination, with a spool, of a click-wheel, a click-spring, a resilient arm upon which said click-spring is mounted, a resilient drag-arm and a cam adjacent to said click-spring and drag adapted when rotated to contact alternately with said resilient arms to render the click-spring and drag alternately operative, and when rotated still further to be removed from contact with both said resilient arms in order to render inoperative both the click-spring and the drag, substantially as specified.

8. In a fishing-reel, the combination, with a spool, of a click-wheel, a click-spring, a resilient arm upon which said click-spring is mounted, and a drag-arm, the said arm upon which the click-spring is mounted and the drag-arm being made in one integral piece, substantially as specified.

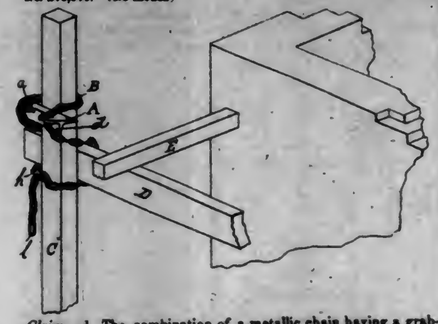


9. In a fishing-reel, the combination, with a spool, of a reel-head provided with a recess upon its inner side, as c^5 a click-wheel within said recess, a click-spring operating in conjunction with the click-wheel, a cam for operating the click-spring, and a hub on said cam composed of resilient jaws or arms arranged in said recess and maintaining the cam by friction, substantially as specified.

10. In a fishing-reel, the combination, with a head provided with an arc-shaped slot and having a recess upon its inner side, of a cam within said recess, a shank upon said cam extending to the exterior of said head, and a button secured upon said shank, said shank being of such length that it will extend beyond the exterior surface of the head, substantially as and for the purpose specified.

405,732.

405,733. ART OF PREPARING ELEMENTS FOR SECONDARY BATTERIES. WILLIAM W. GIBBON, Haverford College, Pa., assignor to The Electrical Accumulator Company, of New York. Filed Sept. 23, 1887. Serial No. 250,470. (No model.)



Claim.—1. The herein-described improvement in the art of preparing elements for secondary batteries, consisting in passing a suitable plate, slab, or ingot of conducting material—such as lead—between suitable dies, whereby the plate, slab, or ingot is compressed into the form of a plate or support having cells, grooves, or receptacles separated by partitions or walls, and then applying an active or absorptive material, substantially as described.

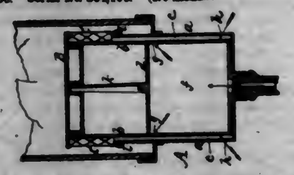
2. The herein-described improvement in the art of preparing elements for secondary batteries, consisting in passing a suitable plate, slab, or ingot of conducting material—such as lead—between suitable dies, whereby the plate, slab, or ingot is compressed into the form of a plate or support having cells, grooves, or receptacles separated by partitions or walls having remnant webs, fins, or scales, removing such webs or scales, and then applying an active or absorptive material, substantially as described.

3. The herein-described improvement in the art of preparing elements for secondary batteries, consisting in passing a suitable plate, slab, or ingot of conducting material—such as lead—between suitable dies, whereby the plate, slab, or ingot is compressed into the form of a plate or support having cells, grooves, or receptacles separated by partitions or walls having remnant fins, webs, or scales, then punching or breaking away such remnant fins, webs, or scales and applying an active material, substantially as described.

4. The herein-described improvement in the art of preparing elements for secondary batteries, consisting in passing a suitable plate, slab, or ingot of lead under a suitable die, whereby the plate, slab, or ingot is compressed into the form of a plate or support having cells, grooves, or receptacles separated by partitions or walls having remnant fins, webs, or scales, then removing the said webs or scales and applying an active or absorptive material, substantially as described.

405,734. SCAFFOLD-FASTENING. CURRAN W. HEISKLE and ADA C. HEISKLE, Washington Court-House, Ohio. Filed Apr. 13, 1888. Serial No. 270,570. (No model.)

Claim.—1. The combination of a metallic chain having a grab-hook at one end of a size to grab any link of said chain, with a metallic clamping-plate fastened by one end to a link of said chain intermediate between the ends of same and having a slot at its other end, said plate having also two biting-edges, one in front and one underneath, both of said edges being parallel to the longer axis of said plate, substantially as described.



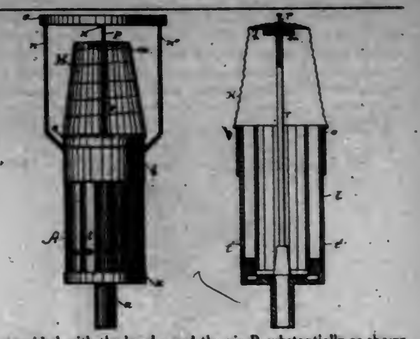
2. The combination, with the ledger D and the upright C, of the metallic chain having a grab-hook at one end and a metallic clamping-plate with two biting-edges fastened intermediate of its length, said plate being fastened to said chain at one end and having a slot in the other end, the construction being such that the upright may be firmly embraced by the middle portion of said chain and the ledger afterward firmly held against the upright by the adjustment of the ends of said chain, substantially as and for the purpose described.

3. The combination of a metallic chain having a grab-hook at one end with a metallic clamping-plate fastened at one end to said chain intermediate between the ends of same and provided at the other end with a slot, substantially as and for the purpose described.

4. The combination of the plate A, having the front edge *c* and under edge *d* and the staple *a* and the slot *b*, with the chain B, provided with the hook A, substantially as and for the purpose described

---

405,735. GAS-BURNER. LEONARD HEISKLE, Rochester, N. Y. Filed Aug. 30, 1888. Serial No. 284,196. (No model.)



Claim.—1. The combination, with a gas-burner consisting of two cylindrical shells joined at the bottom to form a mixing-chamber, said chamber being provided with inlets for gas and air, the inner shell projecting above the top of the outer one, of a cap projecting over the top of the inner shell, and a platinum cylinder or basket inclosing the space around the inner shell and beneath the cap, as and for the purpose set forth.

2. The combination, with a gas-burner consisting of inner and outer cylindrical shells joined at the bottom and having a space between them, forming a mixing-chamber, said chamber being provided with air and gas inlets, and the inner shell extending above the top of the outer one, of a platinum cylinder or covering which extends upward from the outer shell, substantially as shown and described.

3. A gas-burner consisting of two annular shells, as *a* and *b*, having a space between them, forming a mixing-chamber closed at the bottom, a gas-chamber, as *f*, within the inner shell, the outer shell being provided with air-inlets *b* and the inner shell with gas-outlets *g*, substantially as and for the purposes set forth.

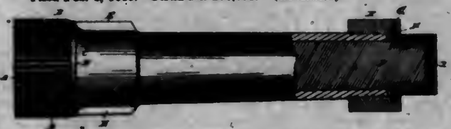
405,736. INCANDESCENT GAS-BURNER. LEONARD HEISKLE, Rochester, N. Y. Filed Mar. 1, 1888. Serial No. 201,602. (No model.)

Claim.—1. The combination, with an Argand gas-burner, of the platinum cone or thimble and the central rod *r*, the cone or thimble being provided with the band *c* and the pin P, substantially as shown and described.

2. The combination, with an Argand gas-burner, of a platinum cone or thimble and a chimney-holder provided with the band *c*, and three or more straight equidistant supporting-arms, the arms and band inclosing the cone or thimble, substantially as shown and described.

3. The combination, with a gas-burner, of the chimney-holder provided with the band *b* and the platinum cone provided with the band *c*, supported by the band *b*, substantially as shown and described.

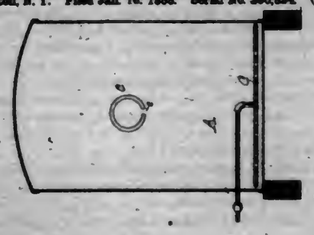
4. The combination of an Argand gas-burner, a platinum cone having a top, a rod extending centrally within the cone, and the supporting button or plate on said rod holding the top of the cone at a determined elevation, substantially as shown and described.



5. The combination, with an Argand gas-burner, of the platinum cone or thimble having a top, a rod extending centrally within the cone, a plate *m* of less extent than the top of the cone on said rod, and a plate of greater extent than plate *m*, supported on plate *m* within the cone and holding the top of the cone at a determined elevation, substantially as shown and described.

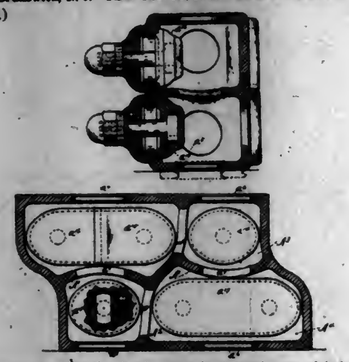
6. The combination, with an Argand gas-burner, of the central rod *r* and the platinum cone or basket, said rod and cone being provided at their tops one with a socket or cavity and the other with an attachment having a pin or projection which enters said socket or cavity, substantially as and for the purpose set forth.

7. The combination, with an Argand gas-burner, of a rod extending centrally above said burner and a platinum cone or thimble resting removably on the top of said rod and pivotally connected therewith, substantially as shown and described.



8. The combination, with an Argand gas-burner, of a rod extending centrally above the same, and a platinum cone or thimble the base of which surrounds the top of the burner and the upper end of which rests removably on the top of the said rod, substantially as described.

405,737. AXLE-BOX. BENJAMIN T. HENRY, New Haven, Conn. Filed Feb. 6, 1889. Serial No. 299,793. (No model.)



Claim.—The combination, with an axle-box having its outer end exteriorly threaded and its extreme inner end provided with outwardly-projecting retaining-points, of a friction-tight extension-nut mounted upon its outer end for adjustment thereon to vary its virtual length, the said retaining-point sinking into the hub and firmly holding the box against turning therein under the severe twisting strain imposed upon the box by turning its friction-tight nut, substantially as set forth.

405,738. EVAPORATING APPARATUS. ROSS J. HOFFMAN, Binghamton, N. Y. Filed Jan. 16, 1888. Serial No. 260,894. (No model.)

Claim.—In combination with the still for treating hydrocarbon oils, a steam-pipe within said still arranged to substantially cover the surface exposed to the heat, the said pipe being placed close to said surface and being provided with discharge-orifices opening directly against the said surface, whereby the jets of steam are caused to impinge directly on the surface to be protected, as and for the purpose set forth.

405,739. **HEADER FOR STEAM-BOILERS.** WILLIAM E. KELLY, New Brunswick, N. J. Filed Feb. 23, 1889. Serial No. 300,901. (No model.)

Claim.—1. A header having two horizontal rows of holes for tubes with a partition extending horizontally between the holes for the two rows of tubes, substantially as specified.

2. A header having a substantially triangular space within it and provided with holes for two horizontal rows of tubes, and having a partition extending horizontally between the holes for the two rows of tubes, substantially as specified.

3. A header having two substantially triangular spaces within it and provided with holes for two horizontal rows of tubes, substantially as specified.

4. A header having two substantially triangular spaces within it and provided with holes for two horizontal rows of tubes, and having a partition extending horizontally between the holes for the two rows of tubes, substantially as specified.

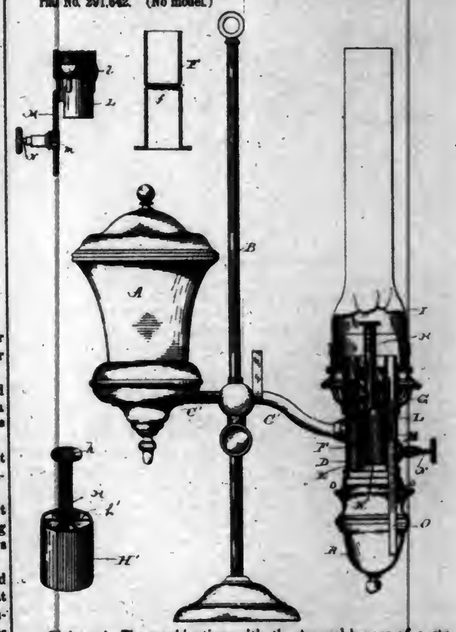
5. A header having a substantially triangular space within it and provided with holes for two horizontal rows of tubes, and having at the front of said substantially triangular space a small ellipsoidal opening opposite one tube and a large oblong opening opposite two tubes in a row, said openings being fitted with removable covers, substantially as specified.

6. A header having two substantially triangular spaces within it and provided at the back with openings for two horizontal rows of tubes and provided in the front with two oblong or elongated openings obliquely opposite each other and two small openings obliquely opposite each other, and one above one of the elongated openings and the other below the other elongated opening, substantially as specified.

7. A header having inclined sides, holes in the back for two horizontal rows of tubes, a partition extending horizontally between the holes for the two rows of tubes, oblong or elongated openings in the front, arranged obliquely opposite one another, and small openings obliquely opposite to one another, substantially as specified.

8. A header having parallel top and bottom and parallel inclined sides and provided with a partition extending horizontally between the top and bottom, and said partition being provided with openings through it at intervals, substantially as specified.

9. A header having parallel top and bottom and parallel inclined sides, a partition extending horizontally through it, and elongated openings arranged obliquely opposite to each other in the front and two small openings arranged obliquely opposite to each other in the front, substantially as specified.



10. The combination, with a header having an opening in the front, of a plate fitted to the rear of said opening and provided with a pocket consisting of an opening, as 6, a cavity 7 at right angles to and at one end of the opening 6, a cavity 8, extending the full length of the opening 6, a bolt fitted in said pocket, and a cover through which said bolt passes, substantially as specified.

11. The combination, with a header having an opening in the front, of two plates overlapping each other and provided with pockets, bolts engaging with the pockets, and a cover through which the bolts pass, substantially as specified.

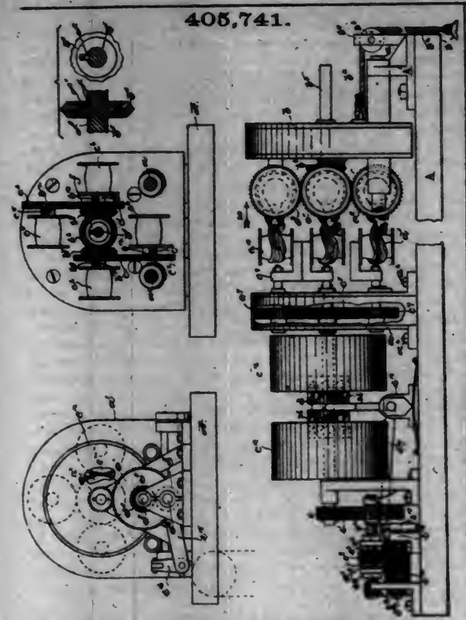
12. A header having a substantially triangular space within it and provided with holes for two horizontal rows of tubes and a horizontal partition between the rows of tubes, and having at the front of said substantially triangular space a small opening opposite one tube and a large opening opposite two tubes in a row, and removable covers for said openings, substantially as specified.

13. In combination with a header having an opening in the front, a plate fitted to the rear of said opening and provided with a pocket comprising a main opening, a cavity at right angles thereto, providing a corner 9 and another cavity at the opposite side of the opening, a bolt fitted in said pocket, and a cover through which the bolt passes substantially as specified.

405,740. **STUDENT-LAMP.** ADOLPH KLEEMANN, Erfurt, Germany, assignor to Hinrichs & Co., New York, N. Y. Filed Nov. 23, 1888. Serial No. 291,642. (No model.)

Claim.—1. The combination, with the Argand burner of a student-lamp, of a cup R, a tube or socket O, extending upward into the wick-chamber and downward into said cup, a wick-raiser consisting of a band L, provided with a rack-bar M and with a recess which fits over the top of said tube when the wick-raiser is drawn down, and a pinion and shaft for operating said wick-raiser, substantially as shown and described.

2. The combination, with an Argand lamp, of a tube or socket O, extending up into the wick-chamber, a wick-raiser consisting of a band L, provided with a rack-bar M, which moves in said tube or socket, said band L being also provided with a recess which fits over the top of the tube or socket O when the wick-raiser is drawn down, and a shaft and pinion for operating the wick-raiser, substantially as shown and described.



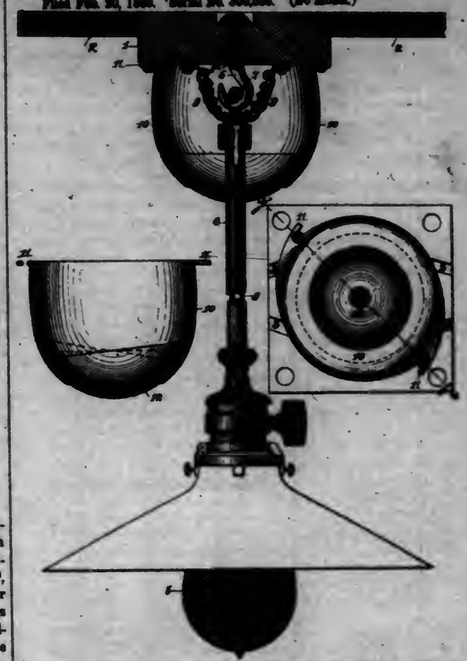
405,741. **MACHINE FOR TWISTING FIBER IN HANKS.** ROBERT M. MACINTOSH, Boston, Mass. Filed Sept. 7, 1888. Serial No. 284,794. (No model.)

Brief.—The object of the invention is to provide an improved machine by which a predetermined number of twists may be given to each hank of thread, whereby a more uniform and better product is obtained.

Claim.—1. In a machine for twisting fiber in hanks, the combination, with a stationary head and a bobbin carried thereby and about which one end of a hank is placed, of a horizontally-movable head and a bobbin carried by it and about which the other end of the hank is placed, gears to produce rotation of said bobbins, a main shaft, a clutch mechanism to operate it, a pulley adapted to be engaged by said clutch mechanism to produce rotation of the main shaft in one direction to twist the hank, a second pulley on the main shaft to be engaged by the clutch mechanism to rotate the main shaft in the opposite direction to untwist the hank, and means, substantially as described, to withdraw the movable head from the stationary head as the hank is being untwisted, substantially as set forth.

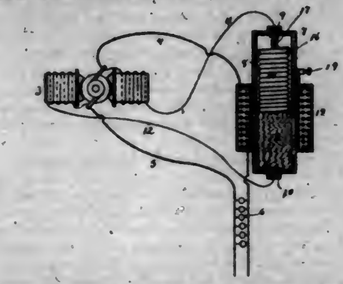
2. In a machine for twisting fiber in hanks, a stationary head and a bobbin carried thereby and about which one end of a hank is placed, combined with a movable head and a bobbin carried by it and about which the other end of the hank is placed, a main shaft provided with pulleys, gears to produce rotation of said bobbins, a clutch mechanism to engage said pulleys, and a reversing mechanism connected to said clutch mechanism, and consisting of a threaded rod c^4, collars fixed thereon and provided with lugs c^6, and a pinion or collar c^5, traveling on said rod, and provided with lugs to engage the lugs on the said collars to automatically engage said clutch with one pulley to twist the hank a predetermined number of times, and with the other pulley to untwist the hank, and with means, substantially as described, to withdraw the movable head from the stationary head as the hank is being untwisted, substantially as described.

405,741.



3. In a machine for twisting fiber in hanks, the combination, with a stationary head and a bobbin carried thereby and about which one end of a hank is placed, of a movable head and a bobbin carried by it and about which the other end of the hank is placed, gears to produce rotation of the said bobbins, a main shaft provided with pulleys, a clutch mechanism to engage said pulleys, and a reversing mechanism connected to said clutch mechanism and adapted to engage said clutch with one pulley to twist the hank and with the other pulley to untwist the hank, and with means, substantially as described, to withdraw the movable head from the stationary head as the hank is being untwisted, and a stopping device actuated by the reversing mechanism to center the said clutch mechanism, and thereby automatically stop the machine when the hank has been twisted a predetermined number of times, substantially as described.

4. In a machine for twisting fiber in hanks, a stationary head, a main shaft provided with a gear, a bobbin about which one end of the hank is placed, and a gear to rotate said bobbin, combined with a movable head through which the main shaft is extended, a gear mounted on the main shaft and carried by the movable head, and a bobbin carried by the movable head and provided with a gear in mesh with the gear on the main shaft, pulleys on the main shaft, and a clutch mechanism to engage said pulleys to produce opposite rotation of the main shaft, and means, substantially as described, to produce rotation of the gears carried by the movable head to move the hank longitudinally, substantially as described.



5. In a machine for twisting fiber in hanks, two heads and bobbins carried by them and about which the hank is placed, one of the said heads being movable with relation to the other, and gears to produce rotation of the bobbins, as described, combined with a main shaft and a clutch mechanism to produce opposite rotations of the said shaft, and with a controlling mechanism, substantially as described, driven by the main shaft and connected to and operating the clutch mechanism to control or govern the direction and duration of rotation of the said main shaft, the said controlling mechanism automatically operating the said clutch mechanism to produce rotation of the main shaft in one direction to give to the hank a predetermined number of twists, and to thereafter rotate the said shaft in the opposite direction to untwist the hanks the same or predetermined number of times, and means, substantially as described, to produce longitudinal movement of the hank when slack or untwisted, substantially as and for the purpose specified.

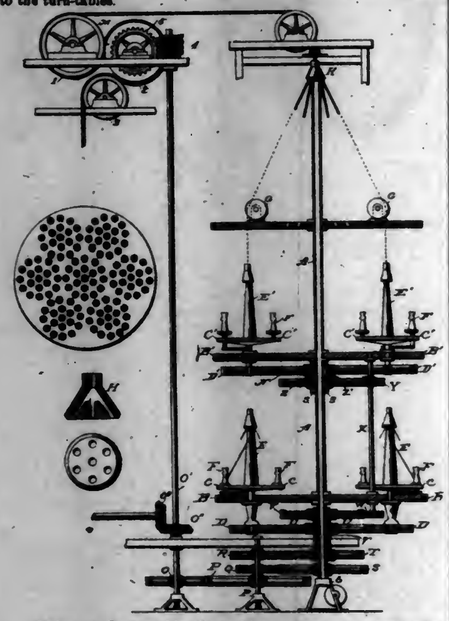
405,742. **ELECTROLIER.** JOHN M. CORWIN, Bridgeport, Conn. Filed Feb. 20, 1889. Serial No. 300,866. (No model.)

Claim.—In an electrolier, the combination, with the ceiling-block and the hanger hinged thereto, of a canopy adapted to fit against the block and open as to its lower end, a cover-plate arranged around the hanger and conformed to the contour of the canopy, and means, as a ring and binder-screw, arranged upon the hanger, whereby the cover-plate is retained against the canopy and the latter against the ceiling-block, substantially as and for the purpose set forth.

405,748. **REGULATOR FOR DYNAMO-ELECTRIC MACHINES.** JAMES H. ROBERTSON, Rutherford, N. J., assignor of three-fifths to Theron A. Richards and John Robertson, Brooklyn, N. Y. Filed May 17, 1888. Serial No. 274,226. (No model.)

Claim.—1. In a regulator for dynamo-electric machines, the combination, with a helix arranged apart from the dynamo in the main line of a circuit, of a core capable of magnetic induction and controlled by said helix, and a conductor placed on said core and in shunt with the main line, whereby the resistance of the shunt is decreased in proportion to the decrease of resistance in the main line, substantially as set forth.

2. In a regulator for dynamo-electric machines, the combination of a helix arranged apart from the dynamo in the main line of a circuit, with a vessel upon which the helix is supported, said vessel inclosing a quantity of mercury or other suitable liquid, and an iron



core and a shunt-circuit connected to said core, substantially as set forth.

3. An electric regulator consisting of a vessel of non-conducting material, in which is inclosed a quantity of mercury or other suitable liquid, an iron core which floats in said liquid and which is connected to one of the wire-attaching devices in the respective ends of said vessel, and a hollow coil or helix arranged upon the vessel, substantially as set forth.

4. A dynamo-regulator consisting of a vessel of non-conducting material, provided with wire-attaching screws at its respective ends and containing a quantity of mercury or other suitable liquid, an insulated iron core having screw-threads cut thereupon, a wire wrapped within said screw-threads and connected electrically with the attaching-screw in the top of said vessel, and a hollow coil or helix adjustably supported around said vessel, substantially as set forth.

405,744. MACHINE FOR MAKING WIRE ROPE. HENRY ROOT, San Francisco, Cal. Filed May 6, 1881. Serial No. 32,589. (No model.)

Brief.—The invention consists in the novel power-transmitting mechanism for rotating the central shaft and imparting rotary motion to the turn-tables.

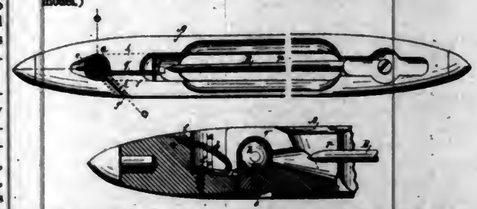
Claim.—1. In a machine for making wire rope, the combination of a central rotary shaft, a platform carried thereby, independent spool-carrying turn-tables on the platform, the shaft *p*, having gears Q and R, a gear on the central shaft meshing with gear Q, a sleeve on said central shaft having a gear T, meshing with the gear R, said sleeve having also a gear U, and gears on the axes of the turn-tables arranged about and meshing with the gear U on the sleeve, substantially as herein described.

2. In a machine for making wire rope, the combination of a central rotary shaft, a lower platform and an upper platform carried by said shaft, independent spool-carrying turn-tables on each of said platforms, a jack-shaft located to one side of the center shaft of the machine, an independently-revolubie sleeve mounted on the central shaft, gears connecting said sleeve with the lower end of the jack-shaft, whereby it is rotated, gears connecting said sleeve with the turn-tables of the lower platform, whereby they are axially rotated, an independently-revolubie sleeve on the central shaft above, and gears connecting said sleeve with the upper end of the jack-shaft and with the turn-tables of the upper platform, whereby they are axially rotated, substantially as described.

3. In a machine for making wire rope, the combination of the central rotary shaft, the lower platform and the upper platform carried thereby, independent spool-carrying turn-tables on each platform, the rotary sleeve *r* on the central shaft, a transmitting-gear U on said sleeve, and gears on the axes of the turn-tables of the lower platform arranged about and meshing with the transmitting-gear U of the sleeve, a second transmitting-gear V on said sleeve, a second sleeve *s*, mounted on the central shaft above and having a receiving-gear Z and a transmitting-gear N, a jack-shaft to one side of the center of the machine, said jack-shaft having a gear meshing with the second transmitting-gear V of the lower sleeve and a gear meshing with the receiving-gear Z of the upper sleeve, and gears on the axes of the turn-tables on the upper platform arranged about and meshing with the transmitting-gear N on the upper sleeve, substantially as herein described.

4. In a machine for making wire rope, the combination of the central rotary shaft, a lower platform and an upper platform carried thereby, independent spool-carrying turn-tables on each platform, a shaft *p*, having gears Q and R, a gear on the central shaft meshing with the gear Q, a sleeve *r* on the central shaft having the gear T meshing with the gear R, said sleeve having also a lower transmitting-gear U and an upper transmitting-gear V, gears on the axes of the turn-tables of the lower platform arranged about and meshing with the lower transmitting-gear U of said sleeve, a second sleeve *s* on the central shaft above and having a receiving-gear Z and a transmitting-gear N, a jack-shaft to one side of the center of the machine, said jack-shaft having a gear meshing with the upper transmitting-gear V of the lower sleeve and a gear meshing with the receiving-gear Z of the upper sleeve, and gears on the axes of the turn-tables on the upper platform arranged about and meshing with the transmitting-gear N of the upper sleeve, substantially as herein described.

5. The means for laying up series of wires around central cores, then laying other series of wires around the strand-cores thus formed, and finally laying the completed strands around a main core to form a rope, consisting of the core-reel J, turn-tables C C, supporting-platforms B B', and a hollow main shaft provided with a perforated cone-shaped head H, in combination with the gear-wheels secured to said turn-tables, sleeves surrounding the main shaft, and gears carried by said sleeves, an auxiliary shaft mounted in the supporting-platforms and provided with gears meshing with the gears upon the sleeves, and means for operating the main shaft and the lowermost sleeve, substantially as herein described.

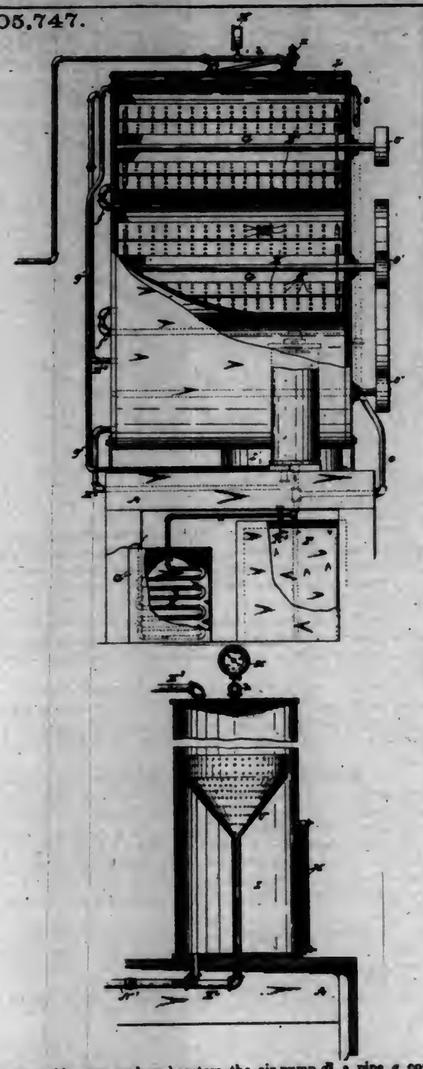


6. The turn-tables or frames C C and the shaft A, and means for supporting said turn-tables and operating the same and the shaft, in combination with the spool-frames F, having cup-shaped tops and provided with cones fitting therein, substantially as herein described.

405,745. PIPE-COUPLING. HENRY S. ROSS, New York, N. Y. Filed Oct. 9, 1888. Serial No. 287,633. (No model.)

Claim.—A pipe-coupling which consists of an internally-threaded outer sleeve reamed out to receive the enlarged ends of the pipes and provided with a shoulder for said enlarged ends to bear against, an inner sleeve externally threaded at a different pitch from said outer sleeve, and an intermediate sleeve threaded internally and externally to fit the threads on said inner and outer sleeves, and projecting beyond the space between said sleeves and adapted to be held stationary while said sleeves are turned, substantially as and for the purpose described.

405,746. SELF-THREADING LOOM-SHUTTLE. EDWIN A. SCHOFIELD, Westerly, R. I. Filed Jan. 24, 1888. Serial No. 261,773. (No model.)



Claim.—The combination, with the tension-ball, the hollowed plug, and the forwardly-projecting hook, of the shuttle-body provided with a slit for guiding the thread between the tension-ball and its seat, and with the oblique slit which guides the thread to the delivering-eye of the shuttle, substantially as described.

405,747. APPARATUS FOR CARBURETING AIR OR GAS. DANIEL J. SNYDER and JAMES STEPHENSON, Scio, Ohio. Filed Jan. 14, 1889. Serial No. 296,354. (No model.)

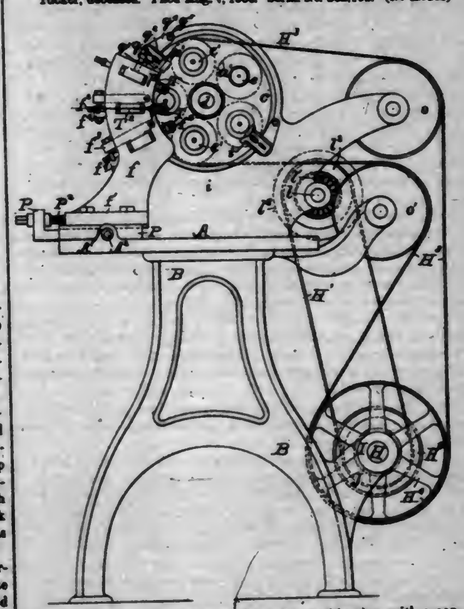
Claim.—1. In a carbureting apparatus, the combination of the oil-tank F, a series of carburetors G, the perforated pipes *f f'*, located in and connecting said carburetors, the oil-pump *d'*, the pipe *e*, connecting said pump and carburetors, the air-pump d^3, a pipe *g*, connecting the air-pump and carburetors, the separating-chamber I, the pipes H^2 and H^3, leading from the carburetors to the separating-chamber, a return-pipe N', leading from the separating-chamber to the oil-tank, the receiving-tank K, and a pipe *h*, leading from the separating-chamber to said tank, substantially as described.

405,747.

2. In a carbureting apparatus, the combination of the steam-jacket L, a series of carburetors G, located one above another in said jacket and provided with rotary dashers H', and perforated oil-conveying pipes above said dashers, the oil-tank F, oil-pump *d'*, air-pump d^3, hot-air jacket G', coiled pipe H, located in said jacket and communicating with the air-pump, the separating-chamber I, to which oil and carbureted air are delivered from the carburetors, and the tank K, for receiving carbureted air from the separator, substantially as described.

3. In a carbureting apparatus, the combination of a series of carburetors G, a tank K, for receiving carbureted air, an intermediate separating-chamber I, the pipe H^3, for conveying oil and carbureted air from the carburetors to the separating-chamber, a perforated funnel located in the separating-chamber on the upper end of said pipe, the pipe H^3, for conveying carbureted air from the carburetors into the upper part of the separating-chamber, and a pipe *h*, connecting said chamber with the receiving-tank K, substantially as described.

405,748. HOSE-COUPLING. PHILO H. STEVENS, Toledo, Ohio. Filed Mar. 16, 1889. Serial No. 303,563. (No model.)



Claim.—1. In a coupling, the combination, with an outer shell, of a cylinder screwed within the same and formed with a forward semi-cylindrical portion having an internal transverse groove and external cam-surface, a second cylinder sliding within said cylinder and having a projection at its forward end, and a cam-faced ring turning on the rigid cylinder, substantially as shown and described.

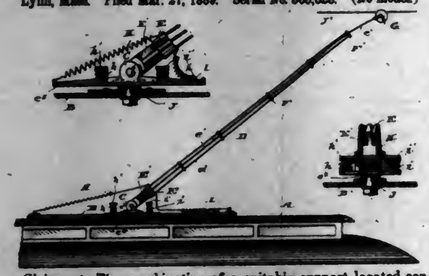
2. In a coupling, oppositely-arranged cylindrical shells, cylinders arranged within the same having projecting semicircular channeled end portions, with telescoping cylinders moving within the same having projections to fit within the shell, and the cam-faced rings turning upon the rigid cylinders and adapted to lock the coupling, substantially as shown and described, as and for the purpose set forth.

3. In a coupling, the combination, with an outer shell, of a cylinder rigidly screwed within the same and having its forward end cut away to form a semi-cylindrical portion, said portion having a transverse groove upon its interior surface near its forward end and having its exterior surface formed with a cam-surface, a second cylinder sliding within the rigid one and the outer shell, its inner or rear end having a packing-ring adapted to bear upon the interior of the shell and form a tight joint, the forward end of said movable cylinder having a semicircular projection adapted to engage with the groove in the rigid cylinder, and a cam-ring turning on the said cylinder to lock two abutting couplings in place, substantially as shown and described.

4. In a coupling having an outer shell E, a cylinder F, rigidly secured thereto, and a sliding cylinder I within the same, an adjustable ring J, secured to the inner end of the cylinder I and grooved to receive the packing-ring J', whereby a tight joint is made with the sides of the outer shell E, substantially as and for the purpose set forth.

405,749. TURNING-MACHINE. HENRY TUCKER and CHARLES TUCKER, Newark, N. J., for themselves and as administrators of Joseph Tucker, deceased. Filed Aug. 7, 1888. Serial No. 282,192. (No model.)

Claim.—1. In a turning-machine, the combination, with a continuously-rotating central arbor, of a series of spindles mounted thereon to rotate about the same and driven at a greater speed than the said arbor, substantially as and for the purpose set forth.



2. In a turning-machine, the combination, with a central arbor,

of a series of parallel spindles mounted thereon to rotate about the same and driven at a greater speed than the said arbor, each of said spindles being provided with a chuck for holding the articles to be turned, a pressing-tool for pressing the articles upon the chucks, a tool-support, and a series of tools secured upon the said tool-support with their cutting-edges adjacent to the path of the chucks about the arbor, substantially as shown and described.

3. In a turning-machine, the combination, with a central arbor, of a series of parallel spindles mounted thereon to rotate about the same and driven at a greater speed than the said arbor, each of said spindles being provided with a chuck for holding the articles to be turned, a pressing-tool for pressing the articles upon the chucks, a tool-support, a series of tools secured upon the said tool-support with their cutting-edges adjacent to the path of the chucks about the arbor, and a stripping-tool for removing the articles from the chucks, substantially as shown and described.

4. In a turning-machine, the combination, with a central arbor, of a series of parallel spindles mounted thereon to rotate about the same and driven at a greater speed than the said arbor, each of such spindles being provided with a chuck for holding the articles to be turned, a pressing-tool for pressing the articles upon the chucks, an adjustable tool-support, a series of tools secured upon the said tool-support with their cutting-edges adjacent to the path of the chucks about the arbor, and a stripping-tool for removing the articles from the chucks, substantially as described.

405,750. STANDING CONTACT-ARM. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Mar. 27, 1889. Serial No. 305,023. (No model.)

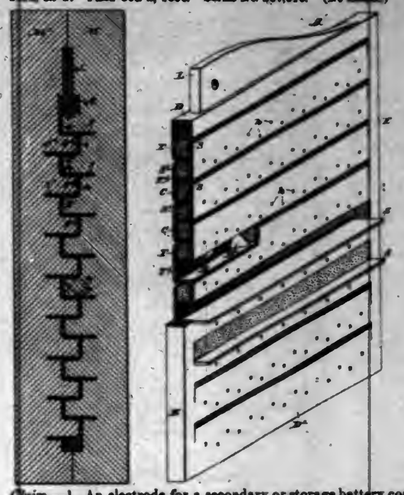
Claim.—1. The combination of a suitable support located centrally upon the top of an electric-railway car, and a contact-carrying arm mounted at its lower extremity in a hinge in said support, said hinge having a limited rotary movement thereon, whereby said arm is rendered movable in an arc including either end of the car, substantially as described.

2. The combination of a suitable support mounted upon an electric-railway car, a contact-carrying arm mounted at its lower extremity in a hinge having a limited rotary movement upon its support, said arm being thereby rendered movable in an arc including either end of the car, and tension-springs engaging the lower part of the arm for imparting an upward tendency to its free end, substantially as described.

3. The combination, with an electric-railway car, of a contact-arm and support therefor, a universal joint mounted upon the support and connected with the lower end of the contact-arm, and lateral stops adapted to engage a projection upon the universal joint for limiting the lateral swinging movement of the contact-arm, substantially as described.

4. The combination, with an electric-railway car, of a contact-arm and hinged support therefor, and buffer-springs mounted upon the support near the hinge of the contact-arm for supporting and raising the same from an approximately horizontal position, substantially as described.

5. The combination, with an electric-railway car, of a contact-arm having a removable end section and a contact device carried thereby.



6. A contact-arm for electric-railway vehicles, having a removable flexible contact-carrying end section, substantially as described.

7. A contact-arm composed of a number of metallic rods rigidly connected to and united by suitable supporting or stay plates, one of said rods being movable in the outer end plate, and a contact device secured to said last-mentioned rod, substantially as described.

8. A contact-arm composed of rigid metallic rods, and a flexible central rod movable in the end thereof and carrying a contact device at its outer extremity.

9. The combination of a suitable support mounted upon an electric-railway car, a contact-arm mounted at its lower extremity in a hinge rotatably mounted upon said support, and tension-springs engaging the lower part of the arm for imparting an upward tendency to its free end, substantially as described.

405,751. SECONDARY BATTERY. JEAN T. VAN GEETEL, New York, N. Y. Filed Oct. 2, 1888. Serial No. 287,016. (No model.)

Claim.—1. An electrode for a secondary or storage battery composed of a single piece of lead or analogous material, having troughs in its opposite faces, said troughs being integral with a common back wall and braced from above and below by brackets, substantially as described.

2. An electrode for a secondary or storage battery composed of lead or analogous material, having struck-up shelves extending across its face, said shelves being braced at intervals with brackets, substantially as described.

3. An electrode for a secondary or storage battery made of a single piece of conducting material, having troughs or shelves on its opposite faces for retaining the active material, said troughs being provided with intermediate bracing-brackets, substantially as described.

4. An electrode for a secondary or storage battery composed of a lead or analogous plate, having shelves for retaining the active material located at different levels on its opposite faces and in the same vertical plane, substantially as described.

5. An electrode for a secondary or storage battery made of a single piece of lead or analogous metal, having shelves or troughs on its opposite sides which encompass the active material when put in place, said shelves being braced by intervening brackets, substantially as described.

6. An electrode for a secondary or storage battery composed of a single piece of lead or analogous material, having perforated shelves on its opposite sides which encompass the active material when in place, said shelves being located at different levels on the opposite sides of the electrode and braced by intermediate brackets, substantially as described.

7. An electrode for a secondary or storage battery composed of lead or analogous material, having a series of retaining-shelves for the active material located on its opposite faces and all in the same vertical plane, in combination with active material held firmly in place by said shelves, substantially as described.

8. An electrode for a secondary or storage battery composed of a single piece of conducting metal, having shelves for the active material, said shelves being located on the opposite faces of the electrode in alternate succession and all in the same vertical plane, substantially as described.

9. An electrode for a secondary or storage battery composed of a single piece of lead or analogous conducting material, having a series of shelves or ledges for the active material located on its opposite faces, the backs and bottoms of the several shelves constituting the supports and tops of the shelves in sequence, substantially as described.

10. An electrode for a secondary or storage battery consisting of a supporting-plate having a series of retaining shelves or ledges on its opposite faces, the backs of which are perforated, in combination with active material held in place by the front edges or lips of said shelves or ledges, substantially as described.

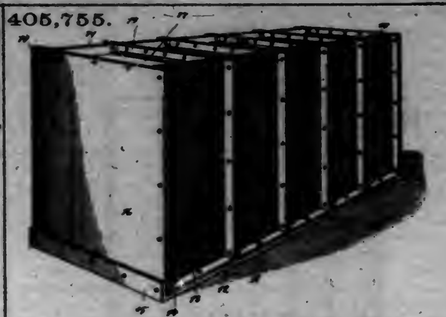
11. An electrode for a secondary or storage battery composed of a single piece of lead or analogous material, having horizontally-disposed perforated shelves on opposite sides which encompass the active material, said shelves being located at different levels on the opposite side of the electrode and having sustaining-brackets located at intervals, the whole being so arranged that when the active material is in place it is encompassed by bent-up edges of the shelves, substantially as described.

405,752. WITHDRAWN.

405,753. LAWN-MOWER. ALEXANDER G. WILKINS, Meadville, Pa. Filed Aug. 17, 1888. Serial No. 282,009. (No model.)

Claim.—1. In a mowing-machine, the combination, with a frame, a ground-wheel mounted therein, and a cam-grooved drum located in front of the ground-wheel and geared therewith, of arms extending forwardly from the frame and provided with downwardly and forwardly projecting lips, a fixed cutter-bar secured to said arms under said lips, a reciprocating cutter-bar working on said fixed bar, the rear edge of which rests under and in contact with the downwardly and forwardly projecting lips, and a vibrating lever for moving the reciprocating cutter, substantially as set forth.

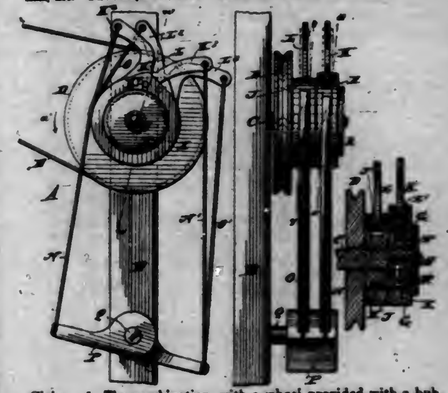
2. In a mowing-machine, the combination, with a frame, a ground-wheel, and a drum having a cam-groove therein mounted in said frame, of arms having forwardly and downwardly projecting lips, a rigid cutter secured to said arms, a reciprocating cutter supported on the fixed cutter with the upper surface of its rear edge in contact with the downwardly and forwardly projecting lips, and a screw adjustably secured to the rear edge of the reciprocating cutter and bearing against the rear edge of the fixed cutter, substantially as set forth.



3. In a mowing-machine, the combination, with a frame and cutter-driving mechanism, of a fixed cutter-bar secured to the frame, a reciprocating cutter-bar mounted on the rigid cutter-bar and connected with the driving mechanism, a lug on the reciprocating bar and having a screw-threaded perforation, a screw passing through said perforation and bearing on the rigid cutter-bar, and a nut on said screw, substantially as set forth.

4. In a mowing-machine, the combination, with a frame and cutter-driving mechanism, of a fixed cutter-bar secured to the frame and having its rear edge bent downwardly, a reciprocating cutter-bar mounted on the rigid cutter-bar and connecting with the driving mechanism, said reciprocating cutter-bar being bent upwardly at its rear edge, and an adjusting-screw passing through the rear edge of the reciprocating bar and bearing on the rear edge of the rigid cutter-bar, substantially as set forth.

405,754. RECOVERING SODA. SEBASTIAN WOLF, Stahlhammer, Upper Hesse, Germany. Filed Dec. 22, 1887. Serial No. 258,747. (No specimens.)



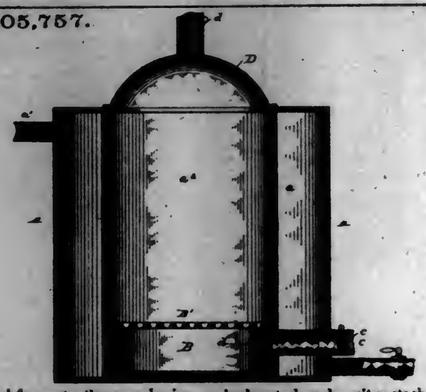
Claim.—In the so-called "sulphate cellulose process," the herein-described improvement, consisting in adding to the brown lye of the process acid sulphate of soda which has previously been treated with the lime-mud of the said process, as and for the purpose set forth.

405,755. ANNEALING-BOX. WILLIAM H. BAILEY, Pittsburg, Pa. Filed Feb. 19, 1889. Serial No. 300,486. (No model.)

Claim.—An annealing-box consisting in the two side plates 11, end plates 16, having outward-extending flanges at their ends riveted at their vertical edges to the flanges of the side plates, a series of vertical outwardly-projecting angle or T irons 12, riveted to the outer faces of the side plates between their ends, the bottom plate 14, projecting at its longitudinal edges beyond the lower edges of the side plates and having upward-projecting ends 15, riveted to the lower edges of the end plates, angle-irons 13, riveted to the lower edges of the sides between angle-irons 12 and to the projecting side edges of the bottom plate, the top plate 17 within the top of the box below its upper edges and provided with upwardly-projecting angle or T irons 17 on its upper side, and supports in the upper end of the box for said cover, substantially as set forth.

405,756. MECHANICAL MOVEMENT. JAMES H. BAKER, Savannah, Mo. Filed Sept. 15, 1888. Serial No. 285,514. (No model.)

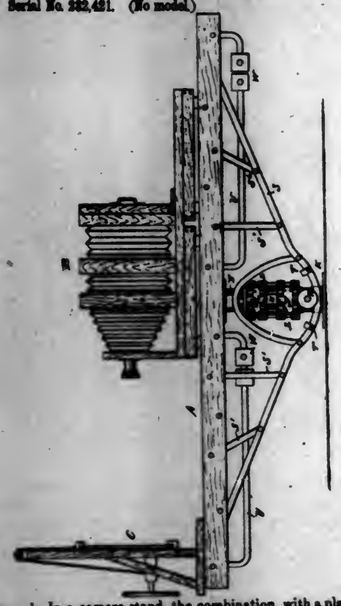
Claim.—1. The combination, with a wheel provided with a hub having two sets of ratchet-teeth standing in opposite directions, of collars fitted loosely on the said hub over the said ratchet-teeth, pawls fulcrumed on the said collars and adapted to engage the said ratchet-teeth, arms formed on the said pawls and extending outward, and a lever connected with the said arms, substantially as shown and described.



2. The combination, with a wheel provided with a hub having two sets of ratchet-teeth standing in opposite directions, of collars mounted to turn on the said hub and fitting over the said ratchet-teeth, a pawl fulcrumed on each of the said collars and engaging the respective ratchet-teeth, two arms formed on each of the said pawls and extending outward in opposite directions, belts connecting with the outer end of each of the said arms, and a lever connected at its ends with the said belts, substantially as shown and described.

405,757. BOILER. JAMES RAGER, York, Nebr. Filed Feb. 1, 1888. Serial No. 263,515. (No model.)

Claim.—The water-heater having the outer annular water-chamber, the central or inner combustion-chamber, the combined ash-pan

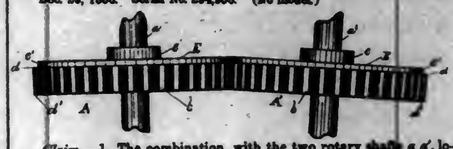


405,757.

and fire-grate, the cover having a valved central smoke exit or stack, and a valved air-inlet pipe arranged in alignment with and having its inner end opposite a draft-opening in the ash-pan, substantially as set forth.

405,758. CAMERA-STAND. FRANK G. BERRETT, New York, N. Y., assignor of one-third to Jacob Kissinger, same place. Filed Aug. 10, 1888. Serial No. 282,421. (No model.)

Claim.—1. In a camera-stand, the combination, with a platform, of a support composed of two parts, cushions interposed between the two parts of said support, and a ball-and-socket joint by which said platform is connected with the support, substantially as set forth.

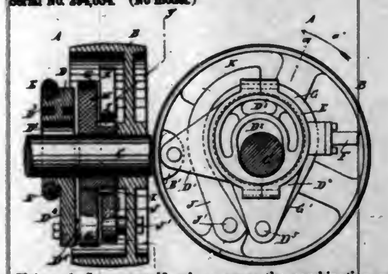


2. In a camera-stand, the combination, with a support, of a platform connected with the support by a ball-and-socket joint, a ring surrounding the support, and rails on the platform connected with said ring, substantially as set forth.

3. In a camera-stand, the combination, with a platform, of a support, a ball-and-socket joint connecting the support and platform, a loose ring surrounding the support, rollers pivoted on said ring, and stretchers or rails secured to the platform and resting against the rims of said rollers, substantially as set forth.

4. In a camera-stand, the combination, with a support, of a platform, a ball-and-socket joint connecting the support and platform, a collar mounted to turn on the support, grooved rollers pivoted on said collar, rails or stretchers secured to the platform and resting on the rim of said rollers, and adjustable check-pieces on said rails, substantially as set forth.

5. The combination, with a support, of a platform mounted to turn and swing on said support, rails on the under side of the platform, and adjustable balancing-weights on said rails, substantially as described.



405,759. GEARING. ABEL M. BENNER, Cleveland, Ohio. Filed Dec. 29, 1888. Serial No. 294,963. (No model.)

Claim.—1. The combination, with the two rotary shafts *a a'*, located angularly to each other, and the two gears A A', each of greater diameter at one peripheral edge than at the other, and having hubs *c' c'*, of the two plate-disks E E, mounted on said hubs next to the sides of the gears which are of greatest diameter, each said plate-disk having its periphery in lateral engagement with the ends of the teeth of its respective gear, while its portion intermediate of its center and periphery is free from said gear, substantially as set forth.

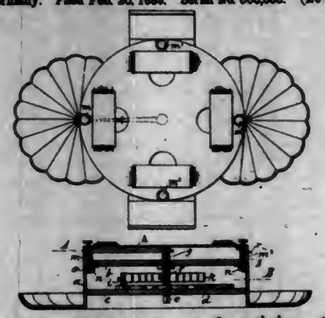
2. The combination, with two rotary shafts *a a'*, located angularly to each other, and the two gears A A', each of greater diameter at one peripheral edge than at the other, and formed with a web located nearer the larger diametrical side, and having hubs *c' c'*, projecting only from said larger diametrical side of the gears, of the two plate-disks E E, respectively, having hubs *e e*, mounted on said gear-hubs *c' c'*, next to the sides of the gears which are of greatest diameter, and the fastening device *f*, each said plate-disk being secured by said hub and fastening means and having its periphery in lateral contact with the ends of the teeth of its respective gear, while its body portion is free from the gear-web, substantially as set forth.

405,760. CENTRIFUGAL GOVERNOR. HENRY L. BENOIT, Vermilion Parish, and EDOUARD NOEL, Abbeville, La. Filed Dec. 19, 1888. Serial No. 294,034. (No model.)

Claim.—1. In a centrifugal governor, the combination, with a pulley secured on the main shaft, of a valve-eccentric pivotally connected with the said pulley and having a slot through which said main shaft passes, a second eccentric pivotally connected with the said first-named eccentric and mounted loosely on the main shaft, and a weighted arm pivoted on the said pulley and controlling the action of the said second eccentric, substantially as shown and described.

2. In a centrifugal governor, the combination, with a pulley secured on the main shaft, of a valve-eccentric pivoted on the said pulley, a second eccentric pivotally connected with the first-named eccentric, a gear-wheel formed on the said second eccentric concentric with the said pulley, a segmental arm geared with the said gear-wheel and fulcrumed on the said pulley, and a weighted arm formed on the said segmental arm, substantially as shown and described.

3. In a centrifugal governor, the combination, with a pulley secured on the main shaft, of a valve-eccentric pivoted on the said pulley, a second eccentric pivotally connected with the first-named eccentric, a gear-wheel formed on the said second eccentric concentric with the said pulley, a segmental arm geared with the said gear-wheel and fulcrumed on the said pulley, and a weighted arm formed on the said segmental arm, and a spring connected at one end with the said segmental arm and at its other arm with the said pulley, substantially as shown and described.



405,761. HIP-BELT. WILLIAM H. BEVINGER, Middletown, Ohio. Filed Jan. 23, 1889. Serial No. 297,306. (No model.)

Claim.—1. In a hip-belt for trousers, the combination, with an inner strip of material provided with a series of button-holes produced therein, of an outer cover-strip of equal length with the inner strip and attached to the inner strip between the button-holes to form a series of pockets, and clamps secured to the outer ends of both strips and adapted to slide upon the body of the belt, substantially as described, whereby the belt may be lengthened or shortened to terminate at the forward suspender-buttons of the waistband, as set forth.

2. In a hip-belt for trousers, the combination, with an inner strip of material provided with a series of button-holes produced therein, of an outer cover-strip of equal length with the inner strip and attached to the inner strip between the button-holes to form a series of pockets, a guide-strip rigidly secured to the center of the belt transversely of the same, a cord attached to the belt near its ends, and a clip attached to the said cord, and clamps secured to the outer ends of both strips and adapted to slide upon the body of the belt, substantially as shown and described, whereby the belt may be lengthened or shortened, as set forth.

405,762. INDICATOR FOR CARD-PLAYERS. LUDWIG BING, Berlin, Germany. Filed Feb. 20, 1889. Serial No. 300,553. (No model.)

Claim.—1. In an indicating apparatus for card-players, the combination, with a suitable stand or support, of a pivoted spring-actuated pointer and a series of movable arresting pins or studs adapted to arrest or permit the passage of the pointer, substantially as set forth.

2. In an indicating apparatus for card-players, the combination, with a suitable stand or support, of a pivoted spring-actuated pointer, a ratchet and pawl for compressing and holding said spring, and a series of movable arresting pins or studs adapted to arrest or permit the passage of the pointer, substantially as set forth.

3. In an indicating apparatus for card-players, the combination, with a suitable stand or support, of a pivoted spring-actuated pointer, a ratchet and pawl for compressing and holding said spring, and a series of movable arresting pins or studs having enlarged and reduced portions and adapted to arrest or permit the passage of the pointer, substantially as set forth.

405,763. BLACKING FOR BOOTS OR SHOES. GEORGE H. BUNNO, Revere, Mass. Filed July 2, 1888. Serial No. 278,945. (Specimens.)

Claim.—The herein-described boot or shoe blacking, consisting of alcohol, shellac, glycerine, lamp-black, castor-oil, linseed-oil, glucose, and copperas, in the proportions and compounded substantially as described.

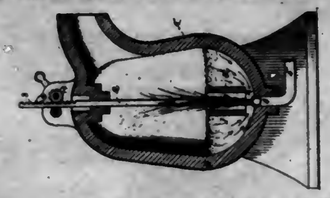
405,764. LAMP-EXTINGUISHER. ANDREW H. BIXLER, North Topeka, Kans. Filed Dec. 20, 1888. Serial No. 294,222. (No model.)

Claim.—1. In a lamp-extinguisher, the combination of the horizontal base-plate having a longitudinal opening formed therein fitting over the wick-tube and being secured to the chimney-base, the wings, located on either side of the wick-tube, pivotally secured to the metallic base-plate and provided with laterally-extending apertured arms, and the spring-lever, the diverging ends of which pass through the apertured extending arms of the pivotal wings, and adapted, when said lever is moved inward or outward, to close or open the wings, substantially as herein shown and described.

2. In a lamp-extinguisher, the combination of the perforated wings secured to either side of the wick-tube, laterally-extending arms secured to the front edges of the pivotal wings, slightly below the center thereof, said wings being provided with the lower upwardly-turned ends, so as to form a tubular bearing, the horizontal base-plate having a longitudinal opening formed therein fitting over the wick-tube and secured to the chimney-base at the lower end of the wick-tube, the rods or wires, located upon each side of the wick-tube, passing through the tubular bearing of the pivotal wings and secured at each end to the metallic base-plate, and the operating spring-lever having the inner diverging ends thereof adapted to pass through the perforations in the laterally-extending arms of the pivotal wings, substantially as herein shown and described.

3. The combination, with a lamp-burner, of the herein-described flame-extinguisher, consisting of wings situated on either side of the wick-tube and provided with suitable openings for the inlet of air, the upper ends of the wings being bent inward and then upward, so as to entirely cover the wick-tube when in a closed position, the metallic base-plate having a longitudinal opening formed therein adapted to fit over the wick-tube and be secured to the chimney-support or base and having the wings pivotally secured thereto, the laterally-extending apertured arms, and the spring-lever, the diverging ends of which pass through the apertured laterally-extending arms, and adapted, when said lever is moved inward or outward, to close or open the wings, substantially as herein shown and described.

405,765. MATCH-LIGHTING DEVICE FOR CIGARS. ADOLF BLOCK, New York, N. Y. Filed Sept. 18, 1888. Serial No. 285,715. (No model.)



Claim.—1. A cigar having a longitudinal draft-hole in its tip and provided with a detachable tube inserted in said hole, said tube having on its interior a rough frictional surface, substantially as described.

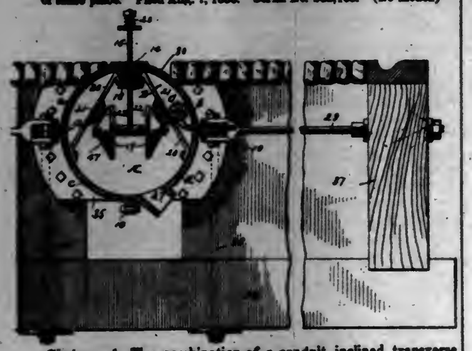
2. A cigar having a longitudinal draft-hole in its tip and provided with a detachable tube inserted in said hole, and a friction-match within said tube, said tube having on its interior a rough frictional surface, substantially as described.

3. A match-lighter for a cigar, consisting of a tube of about the diameter of a match and adapted for insertion in the draft-hole of a cigar-tip, said tube being provided on its interior with a rough frictional surface, substantially as described.

405,766. APPARATUS FOR CONVERTING CRUDE METAL INTO MALLEABLE IRON OR STEEL. JOHN W. BOOKWALTER, Springfield, Ohio. Filed Oct. 18, 1888. Serial No. 288,486. (No model.)

Claim.—1. A converter having at the bottom two chambers, one for holding the body of metal, the other communicating with the first at a point below the normal surface of the metal and constituting a conversion-chamber, and a blast-pipe communicating with the conversion-chamber and arranged to direct the blast upon the inflowing current and upward from the conversion-chamber, substantially as set forth.

2. A converter having its main chamber divided near the bottom by a transverse partition into two chambers of different sizes, said partition having one or more channels connecting the chambers, in combination with a nozzle or tuyere arranged to direct a blast into and from the smaller chamber near the top thereof, substantially as set forth.

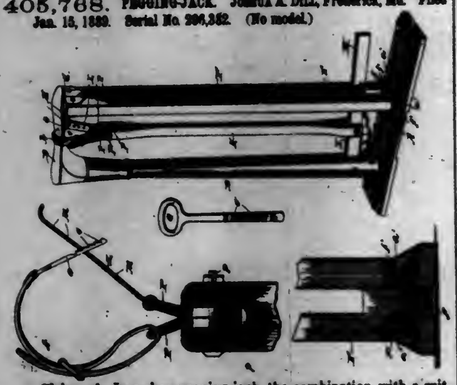


3. The combination, with a converter, of a partition dividing the lower portion of the converter into two chambers, a channel connecting the said chambers, means for varying the size of said channel, and a nozzle or tuyere extending into one of the chambers, substantially as set forth.

4. The combination, with a converter, of a partition separating the lower portion of the converter into two chambers, a channel connecting the chambers at a point adjacent to the bottom of the converter, a valve regulating the flow through said channel, and a nozzle or tuyere communicating with one of the chambers, substantially as set forth.

5. The combination, with a converter, of a partition dividing the lower portion of the converter into two chambers of different sizes and having a rounded or curved side adjacent to the larger chamber,

a channel connecting the two chambers near the bottom of the converter, and a nozzle or tuyere extending to the smaller chamber, substantially as set forth.

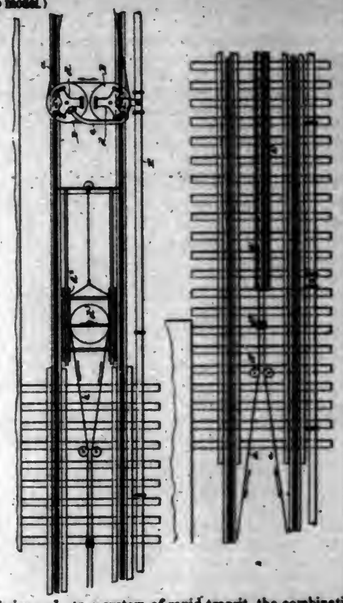


405,767. CONDUIT FOR CABLE OR ELECTRIC RAILWAYS. WILLIAM J. BRENNER, New York, N. Y., assignor of three-fifths to Thomas W. Rae, Frederick H. Reed, Walter Thompson, and George H. McGibbin, all of same place. Filed Aug. 7, 1888. Serial No. 282,163. (No model.)

Claim.—1. The combination of a conduit, inclined transverse braces, an inclined longitudinal strip supported by said braces, a conductor secured to said strip, and a beveled contact wheel or brush, substantially as described.

2. The combination of a conduit composed of detachable sections in cross-section, transverse braces for sustaining the upper sections, a longitudinally-extending insulator-strip, and connections between the strip and the braces to permit the strip to move longitudinally with respect thereto, substantially as described.

405,768. PEGGING-JACK. JOSHUA A. DILL, Frederick, Md. Filed Jan. 15, 1889. Serial No. 296,352. (No model.)



Claim.—1. In a shoe-pegging jack, the combination, with a suitable base, of a rigid standard having a shoe-last swiveled on its upper end, the toe-support pivoted to the base and adapted to be inserted at its upper end under the toe of the last, the operating-lever pivoted to said standard, and the pitman pivoted at its lower end to said lever and connected by a strap at its upper end to the last, substantially as and in the manner described.

2. In a pegging-jack, the combination, with the heel and toe supports having a last bearing thereon and the lever pivoted to the heel-support, of the pitman connected to the lever and the latch secured to the upper end of the pitman, said latch comprising a rigid perforated strap, and a flexible strap provided with a notched or serrated pin engaging the perforations of the rigid strap, substantially as specified.

3. In a pegging-jack, the combination, with the heel and toe supports having the shoe-last arranged thereon, of the foot-lever, the pitman connected to the lever, the loops carried by the upper end of said pitman, a rigid perforated strap L, connected to one of said loops, and a flexible and extensible strap N, connected to the other of said loops and carrying at its free end a serrated pin O, adapted to engage the perforations in said strap L, as and for the purpose set forth.

4. In a pegging-jack, the combination of the base, the stationary heel-support having a shoe-last attached to its upper end, the swinging toe-support pivoted at its lower end to the base and provided with a vertical slot, the foot-lever pivoted to the heel-support and operating at its free end in the slot of the toe-support, the rigid pitman connected at its lower end to the said lever and provided at its upper end with a latch to embrace the last, and the spring bearing against the under side of the foot-lever to normally hold the same elevated, substantially as specified.

405,769. SYSTEM OF RAPID TRANSIT. HENRY FLAD, St. Louis, Mo. Filed June 16, 1887. Renewed May 28, 1889. Serial No. 312,545. (No model.)

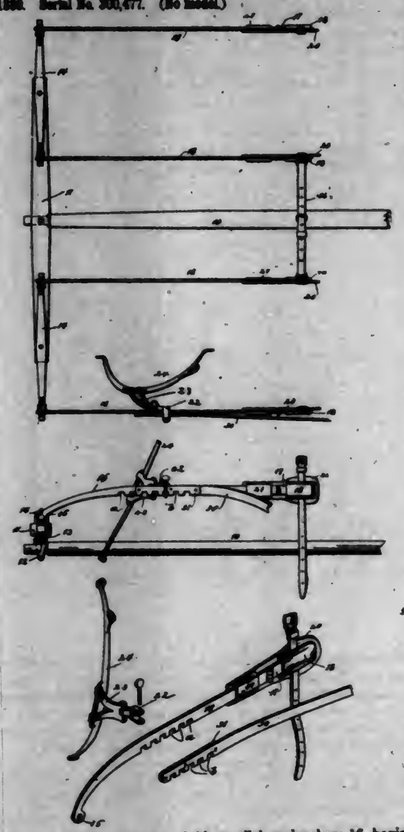
Claim.—1. In a system of rapid transit, the combination, with several independent cables located along a single track and motors for actuating the cables, the idle and working portions of said cables passing in the same horizontal plane in opposite directions, the idle portion being covered with a housing, of a common power-supply located along the track and having connection with the several motors, substantially as set forth.

2. In a rapid-transit system, the combination, with several endless cables located one after another along a single track, the idle and working portion of said cables passing in opposite directions in the same horizontal plane, the idle portion being covered by a suitable housing, and independent motors for actuating the cables, of a centrally-located supply-reservoir, and power-supply conduits leading in opposite directions from the central supply-reservoir to the several motors.

3. In a rapid-transit system, the combination, with a series of independent endless cables located one after another along the track, the said cables passing over the ties of the track and provided with housings for covering the idle portion of the cables, of engines for actuating the cables, and a power-supply conduit located along both the outbound and return tracks in proximity thereto, adapted to supply motive power to the engines, substantially as set forth.

405,770. DUMPING-CART. SAMUEL GAFFT, Hagerstown, Md. Filed Apr. 15, 1889. Serial No. 307,877. (No model.)

Claim.—1. In a dumping-cart, the combination of a cart-body hinged to the rear ends of the shafts, an axle having the crank-arms, the connecting-rods, and the lever, substantially as set forth.



2. The combination of a cart-body hinged to the rear ends of the shafts, an axle having the crank-arms, the connecting-rods, the loose collars, and the lever, substantially as set forth.

3. The combination of a cart-body hinged to the rear ends of the shafts, an axle having the crank-arms, the connecting-rods, the stirrups, and the lever, substantially as set forth.

4. The combination of a cart-body hinged to the rear ends of the shafts and having the stirrups, an axle having the crank-arms, the loose collars, the connecting-rods, and the lever, substantially as set forth.

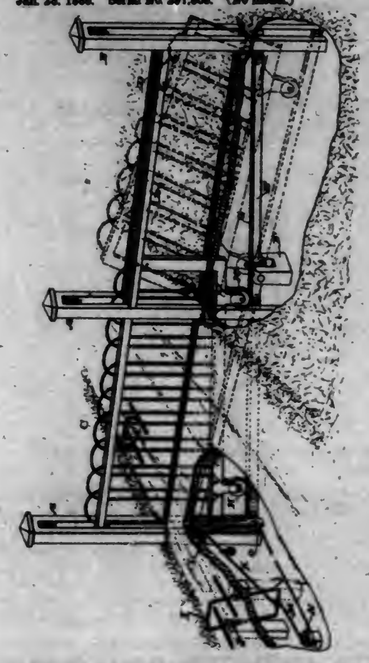
5. The combination of a cart-body hinged to the rear ends of the shafts and having the stirrups, an axle having the crank-arms, the connecting-rods, the loose collars, the lever, and the cross-bar having the stop-plates at its projecting ends, substantially as set forth.

405,771. HARNESS. ISAAC J. GRAY, Beloit, Wis. Filed Feb. 19, 1889. Serial No. 300,477. (No model.)

Claim.—1. In a harness, rigid parallel pusher-bars 16, having singletree-connections at their front ends, straps at their rear ends to pass around the body of the animal, and means for connecting the bars between their ends to a collar, substantially as set forth.

2. The combination, with two pairs of rigid pusher-bars 16, adapted for connection at their front ends with singletrees and of a length sufficient to extend along the sides of the animal, and a connection, as 36, between the rear ends of the inner bars, of a pair of hames between each pair of bars, one member of each pair having a hinged connection with one of said bars between its ends, substantially as set forth.

3. The combination, with two parallel rigid pusher-bars between which the animal is held, adapted at their front ends for connection with a singletree, of hames having opposite rearwardly-extending hinged arms 23 detachably connected to said bars between their ends, substantially as set forth.



4. The combination, with the parallel pusher-bars having notched edges in rear of their front ends, said ends being adapted for connection with a singletree, of hames having rearward-extending hinged arms provided with hinged connections engaging the notches of the bars, substantially as set forth.

5. The combination, with the hames, of the hinged arms 23, tongues 33, hinged to the outer ends thereof and provided with lugs 34, and bows 32, hinged to the tongues to swing over said lugs, substantially as set forth.

6. In a harness, a rigid pusher-bar adapted for connection with a singletree at its front end, provided with notches 23, a hinged section 17 at it rear end, and a pad having housing 18 21, substantially as set forth.

7. The combination, with the notched pusher-bars 16, adapted for connection with a singletree at their front ends and notched in rear thereof, and the tugs 30, having a notched plate 31 at their front ends, the notches of which register with those of the pusher-bars, of hames having hinged connections connecting them with the notched bars and the notched plates, substantially as set forth.

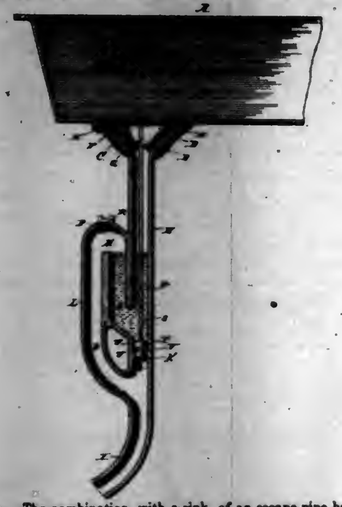
405,772. GATE. GOTTARDO GUERRINI, Point Reyes, Cal. Filed Jan. 23, 1888. Serial No. 297,302. (No model.)

Claim.—1. A centrally-pivoted straight beam beneath the surface of the ground in the line of the fence, a standard to which the beam is pivoted, a gate and gate-posts with guides between which the gate travels endwise, and rollers upon the bottom of the gate fitting upon a track on the top of the tilting beam, in combination with the hoop-levers having their lower ends extended and fulcrumed in the roadway, and the cords attached to said ends and passing over pulleys and connecting the lower ends of said levers with the tilting beam at points above and below, respectively, substantially as described.

2. The tilting beam fulcrumed in the line of travel of the gate, pivoted levers in the roadway having connections with the tilting beam at points above and below it, whereby said beam is tilted so as to raise either end, a gate having rollers fitted to a track upon the top of the tilting beam, and guides between which it travels, so as to close or unclose the gate-opening, said gate being made deeper at one end than at the other, substantially as described.

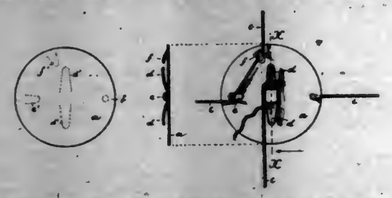
3. The combination, with a tilting beam fulcrumed in the line of travel of the gate, of a gate having its top and bottom diverging from the rear end post toward the front post, substantially as described.

405,773. NUT-LOCK. ANDREW J. GUSS, Valley Falls, Kans. Filed Oct. 3, 1888. Serial No. 287,036. (No model.)



Claim.—In a nut-lock, the combination, with a bolt and nut of ordinary construction, of the beam A, having the shallow recess *a* and the pin-recess *a'* therein, the locking-plate D, having the notch E in its edge registering with the recess *a'* and the detent edge F adjoin-

405,773.

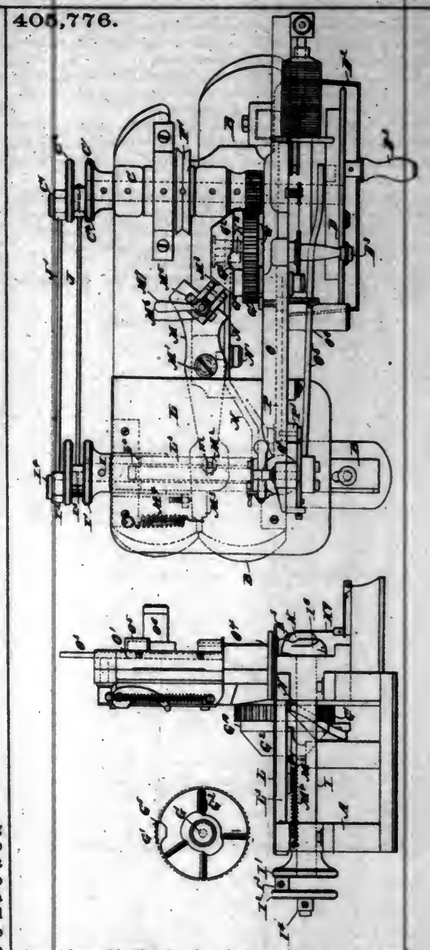


ing said notch, and the pin G, inserted in the notch E and recess *d* and standing against the side of the nut, substantially as specified.

405,774. SEWER-TRAP. GEORGE C. HAGER, Danbury, Conn. Filed Jan. 29, 1889. Serial No. 297,964. (No model.)

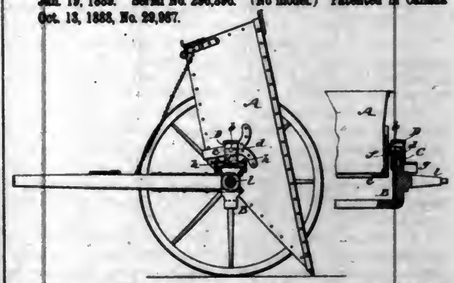
Claim.—The combination, with a sink, of an escape-pipe having a chamber formed on one side thereof with its upper end below the level of the sink, a vertical partition in said chamber terminating at a distance from the upper end of the latter, openings connecting the lower ends of the compartments of said casing with the said pipe, a valve seated in the latter between the said openings, and a jointed operating-rod extending from said valve upwardly through the strainer-plate of the sink, substantially as and for the purpose herein set forth.

405,775. PACKAGE-FASTENER. THOMAS T. H. HARWOOD, Rockport, Mass. Filed Mar. 11, 1889. Serial No. 302,811. (No model.)



Claim.—The improved fastening device, as described, consisting of the plate *a*, having made in one piece with it the cleats or projections *d d*, combined with the cord *c*, secured to said plate, substantially in a manner and for the purpose set forth.

405,776. SEWING-MACHINE. JAMES HOGAN, Perth Amboy, N. J., assignor to S. M. Schwab, Jr., & Co., New York, N. Y. Filed June 28, 1888. Serial No. 278,405. (No model.) Patented in England Mar. 14, 1887, No. 3,836.



Claim.—In a sewing-machine of the character hereinbefore described, the combination, with the pivotally-mounted vibrating head, the needle-bar carrying the needle and sliding in said head, the looper-shaft, and means for operating these parts, as specified, of the reciprocating feed-plate and sliding arm L^2, to which it is attached, the

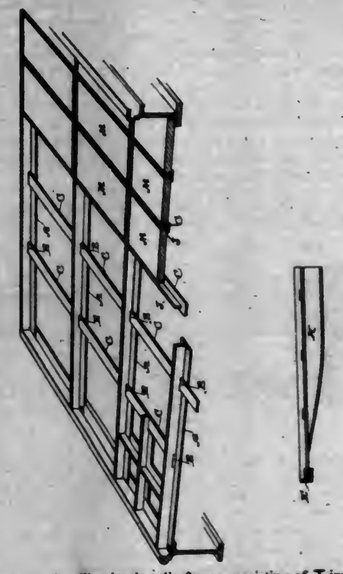
405,776.

pivoted lever M, vibrating in a horizontal plane and engaging said arm, the pivoted lever N, which vibrates vertically for raising the feed-plate, and the cam G^3, actuating both the aforesaid levers M N, as shown and described, whereby the needle is caused to make three strokes and the feed-plate one forward and two rearward movements in the same space of time, as and for the purpose set forth.

405,777. DUMPING-CART. THOMAS HILL, Jersey City, N. J. Filed Jan. 19, 1889. Serial No. 296,896. (No model.) Patented in Canada Oct. 13, 1888, No. 29,987.

Claim.—1. In a dumping-cart or other vehicle having its body carried by side pivots or projections, an elastic rubber pedestal for said pivots or projections composed of an upright body part and an extended yielding base or foot flange, substantially as specified.

2. In a vehicle, the elastic rubber pedestal C, having an extended base or foot flange *c*, in combination with the metal bearing *d*, having a socketed fit within said pedestal, essentially as described.



3. In vehicles having pivots on their bodies and spring supports or pedestals carrying the same, the metal box or upright D, constructed with a hollow body part closed on top but open below, essentially as described, whereby the spring support or pedestal may be inserted from the bottom, as set forth.

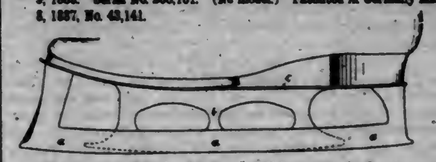
4. In vehicles having side pivots on their bodies, the combination of the elastic rubber pedestal C, having a base-flange *c*, and the open-bottom metal box or upright D, having an extended base and adapted to receive within it from below and inclose said pedestal, substantially as specified.

5. In a spring-support for vehicles, the metal box D, adapted to contain the spring, and consisting of an upright body part open below but closed on top, and extended recessed flange-like base, and a mud-guard *g*, all integral with one another, essentially as shown and described.

6. The combination, with the body of the vehicle having side pivots or supports *b*, of the metal box D, open at its bottom, also having an opening *f* in its inner face or side and a flange-like base, the rubber pedestal C, having an upright body part and extended base or foot flange *c*, the socketed metal bearing *d*, and the axle B or support carrying the metal box and contained pedestal, substantially as specified.

405,778. FRAME FOR ILLUMINATING-TILES. PETER H. JACKSON, San Francisco, Cal. Filed Mar. 25, 1889. Serial No. 304,729. (No model.)

Claim.—1. An illuminating-tile frame consisting of T-iron supporting-bars, slotted, as shown, and transverse flat bars passing through said slots and forming supports for the tiles, substantially as herein described.

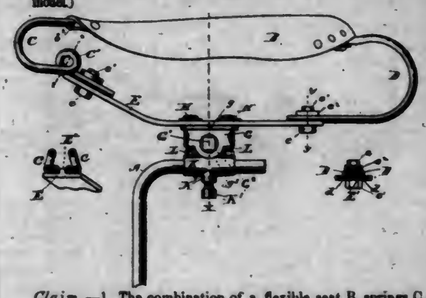


2. An illuminating-tile consisting of a frame-work having the slotted T-iron bars, with flat bars passing transversely through the slots, with glass blocks fitting into the spaces and supported by the frames beneath, with a cementing and filling material beneath and between the glass, substantially as herein described.

3. An illuminating-tile consisting of the frame-work formed of T-iron bars having slot-holes, with transverse flat bars passing through said slots, forming rectangular spaces for the reception of glass, outside bars of angle-iron, and the flanges of which the T-bars are secured, substantially as herein described.

4. An illuminating-tile consisting of the frame-work composed of T-iron bars having slot-holes, and flat bars passing transversely through said slot-holes, angle-iron end pieces fitted and bolted to the ends of the T-iron bars and forming a frame with regular spaces, glass plates fitting said spaces and supported upon the horizontal surfaces of the bars, and a support and filling of cement beneath and around the glass, substantially as herein described.

5. An illuminating-tile consisting of a frame-work of slotted T-iron bars, with flat bars passing through said slots, and angle or equivalent iron end pieces to which the T-iron bars are secured, and a filling of cement or metal strips upon which the glass is supported, vertical strips of iron between the glass, and a surrounding filling of cementing material whereby the whole is secured together, substantially as herein described.

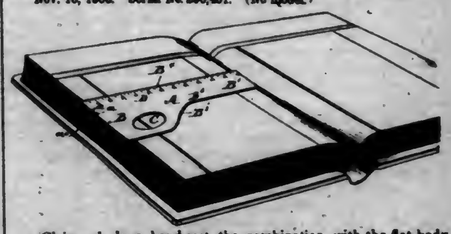


405,779. SKATE. LOUIS KEMER, Worms, Germany. Filed Jan. 9, 1888. Serial No. 260,181. (No model.) Patented in Germany Mar. 8, 1887, No. 43,141.

Claim.—1. A skate having two parallel runners, the inner runner being shorter than the outer runner, substantially as set forth.

2. A skate having two parallel runners, the inner runner being shorter than the outer runner and both runners having the middle parts of the bottom edges made straight and on the same plane, the bottom edges of both runners being inclined or curved upward toward the ends, substantially as set forth.

405,780. VELOCIPEDE-SADDLE AND SUPPORTING DEVICE. JOHN KNOX, Hartford, Conn., assignor to the Pope Manufacturing Company, Portland, Me. Filed Oct. 20, 1888. Serial No. 288,652. (No model.)



Claim.—1. The combination of a flexible seat B, springs C D, under plate E, stops $E' E^2$, bolts *e e*, and grips e^3 e^3, constructed to operate essentially as set forth.

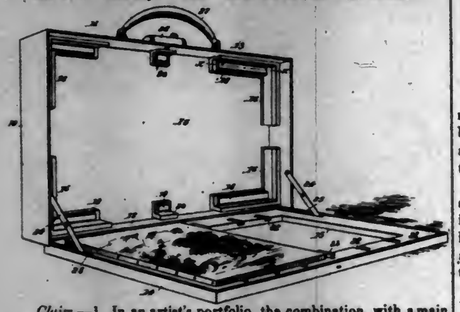
2. The combination of clip-base K, a longitudinal mortise k^2, a threaded seat K^3, a set-screw K^4, ear K', a transverse perforation *k'*, a screw-abutment k^2 k^2, a tilt-block G, plate-seat *g*, ear G^3, a transverse perforation *g'*, vertical tip-screws L L, a saddle under plate E, and a screws H H, constructed to operate essentially as set forth.

3. The combination of the flexible seat B, the front and rear springs C D and their connecting devices, substantially as set forth, the longitudinal under plate E, and the devices, substantially as set forth, for adjusting and securing the springs upon the under plate longitudinally and laterally.

405,781. HAND-REST. HENRY F. KRETTER, St. Louis, Mo. Filed Nov. 10, 1888. Serial No. 290,431. (No model.)

Claim.—1. In a hand-rest, the combination, with the flat body portion having notches produced in one end, of a latch pivoted beneath the notched end, provided with a recess adapted to register with the surface of the body between the notches, substantially as shown and described.

2. In a hand-rest, the combination, with a flat body portion, of an angular rib attached to the under side of the body portion a short distance from its longitudinal edge and parallel with the same, substantially as shown and described.



3. In a hand-rest, the combination, with a flat body portion of greater width at one end than at the other and provided with one

straight longitudinal edge beveled upon the under side, and notches produced in one end, the surface between which notches is convexed, of a latch pivoted beneath the notched end, provided with a semicircular recess adapted to register with the convex surface of the body, substantially as shown and described.

4. In a hand-rest, the combination, with a flat body portion of greater width at one end than at the other and provided with one straight edge beveled upon the under side and a thumb-opening, of a rib-like projection upon the under side of the body parallel with the straight edge, substantially as shown and described.

5. As an improved article of manufacture, a hand-rest consisting of a flat body portion of greater width at one end than at the other, having one straight edge beveled upon the under side and spaced notches produced in one end, the surface between which notches is convexed and provided with a scale upon the upper body-surface near the straight edge, and a thumb-opening, a projection formed upon the under face of the body parallel with the straight edge, and a latch provided with a circular recess registering with the notches in the body, substantially as shown and described.

405,782. ARTIST'S PORTFOLIO. FLORA M. LA BRUCE, Annandale, S. C. Filed Sept. 8, 1888. Serial No. 284,899. (No model.)

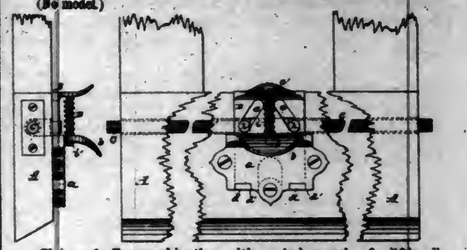
Claim.—1. In an artist's portfolio, the combination, with a main or body frame and an auxiliary frame hinged thereto adapted to fold therein, of a marginal frame held within the auxiliary frame, essentially L-shaped corner-pieces attached to the inner side of the main or body frame, and spring-actuated cushions attached to the said corner-pieces, all combined to operate substantially as and for the purpose specified.

2. The combination, with a main or body frame and an auxiliary frame hinged thereto adapted to fold therein, of a marginal frame secured within the auxiliary frame, provided with a series of transverse grooves, pins adapted to slide in said grooves, essentially L-shaped corner-pieces attached within the main frame, having a longitudinal recess in the horizontal member, and spring-actuated cushions secured within the recess of the corner-pieces, substantially as shown and described.

3. The combination, with a main frame and an auxiliary frame attached thereto adapted to fold therein, of a marginal frame within the auxiliary frame and spring-actuated cushions attached to the inner side of the main frame at or near the corners, substantially as shown and described.

4. The combination, with a main frame and an auxiliary frame attached thereto adapted to fold therein, of a marginal frame within the auxiliary frame, spring-actuated cushions attached to the inner side of the main frame at or near the corners, and a small cushion intervening the corner cushions, substantially as and for the purpose specified.

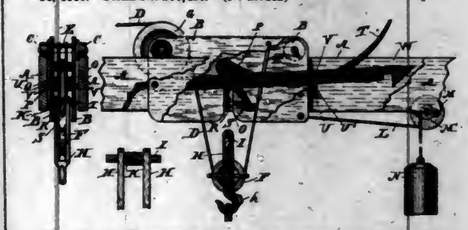
5. The combination, with a main or body frame and an auxiliary frame attached thereto adapted to fold therein, of a marginal frame secured within the auxiliary frame, having dovetail transverse grooves produced therein, dovetail pins adapted to enter said grooves, essentially L-shaped corner-pieces secured to the inner side of the main frame, having a longitudinal recess in the horizontal member, spring-actuated cushions of a light material held within the recess of the corner-pieces, and spring-actuated cushions secured to the said body-frame intermediate of the corner cushions at top and bottom, substantially as and for the purpose specified.



405,783. SCARF-PIN. JOSEPH C. LEIBEL, Colorado Springs, Colo., assignor of one-half to D. Ashby, same place. Filed June 22, 1888. Serial No. 277,992. (Model.)

Claim.—1. A scarf-pin provided back of the ornamental head with a bend the lower leg of which is inclined downward, whereby the pin may be inserted in a scarf, the ornamental head being caused to lie flat upon said scarf, substantially as described.

2. A scarf-pin having the portion of the pin opposite the ornamental head bent back out of the plane of the portion below it, but parallel thereto, and connected therewith by the inclined part *g*, whereby the rear face of the ornamental head will lie approximately in the plane of the portion of the pin below it, substantially as specified.



405,784. SASH-FASTENER. WILLIAM LIVINGSTONE, Jersey City, N. J. Filed Aug. 4, 1888. Renewed May 28, 1889. Serial No. 312,435. (No model.)

Claim.—1. The combination, with a window-sash, of a lifting-lip rigidly secured to said sash, a plate having two inclined slots, and two bolts provided with pins or lugs resting in said slots, the said bolts adapted to be moved longitudinally by contact of the pins or lugs with the inclined walls of the slots, substantially as set forth.

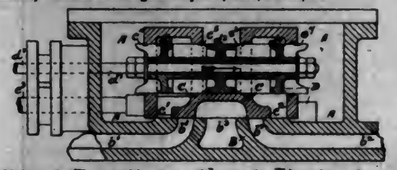
2. The combination, with a window-sash, of a bracket rigidly secured thereto and provided with a lifting-lip, a sliding plate mounted in said bracket and having oblique slots, a spring to maintain the sliding plate in a normal upward position, two bolts mounted in the sash, and lugs or pins projecting from said bolts into the oblique slots of the sliding plate, substantially as set forth.

405,785. CARRIER. TIMOTHY LOUD, Milwaukee, Wis. Filed Feb. 11, 1889. Serial No. 299,426. (No model.)

Claim.—1. The combination, in a carrier provided with wheels and traveling on a track, of the frame which has a recess for the reception and travel therein of the sheave-frame, a bent lever pivoted in the carrier, which lever has a hook and a beveled outer end on one arm and a curved edge on the other arm, a swinging arm provided with a front beveled end and a recess, and a pin inserted in the track and adapted to impinge with the lever and with the arm of the carrier, substantially as described.

2. The combination, in a carrier, of a bent lever, having a hook on one arm and a curved edge on the other arm, pivoted therein, a straight horizontal arm, having a beveled end and a recess therein, pivoted at one end of the carrier-frame, and extending past a sheave-frame-receiving recess in the carrier and projecting beyond the carrier, a sheave-frame having a bar adapted to impinge against the straight arm and to engage with the hook on the bent lever, and a pin fixed in the rails of the track adapted to impinge against the lever and the arm and to engage with the arm, substantially as described.

405,786. BURNER FOR NIGHT-LIGHTS. RIARD LUDOR, Mapath, N. Y. Filed Jan. 22, 1889. Serial No. 297,132. (No model.)

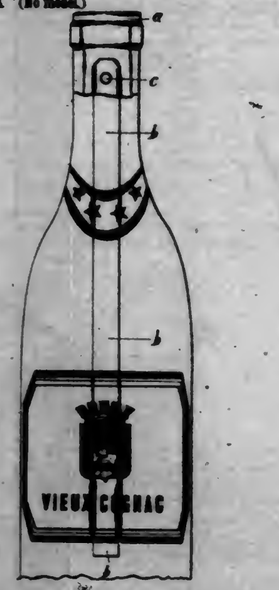


Claim.—1. A burner for night-lights composed of a ring-shaped float, a top plate having a recess forming prongs, and a bottom plate provided with raised projections or teats below said prongs for holding the taper or wick in upright position, substantially as set forth.

2. In a burner for night-lights, the combination, with a ring-shaped float, of a top plate having a recess forming prongs and a handle integral therewith, and a bottom plate provided with raised projections or teats below said prongs for holding the taper or wick in connection with the prongs of the top plate, substantially as set forth.

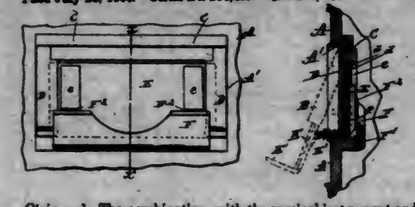
3. The combination, with a ring-shaped float, of a top plate provided with a recess forming prongs, and with a handle made integral therewith, and a bottom plate having raised projections or teats below said prongs, said top and bottom plates being retained on the float by bent prongs of the top plate passing through slots of the bottom plate, substantially as set forth.

405,787. STEAM-VALVE. JOHN W. MELLING, Wigan, County of Lancaster, England. Filed Sept. 26, 1888. Serial No. 286,643. (No model.) Patented in England Sept. 28, 1887, No. 13,178.



Claim.—1. The combination, with a main slide-valve, of a compound expansion-valve made up of disks of equal areas mounted in pairs connected together and arranged to slide in rings or seatings, said main valve having a steam-admission opening to the expansion-valve on each side of each cut-off disk, all substantially as herein set forth, for the purposes specified.

2. The combination, with a main slide-valve, of an expansion-valve D, consisting of three disks of equal areas connected together and fitted and working in rings formed by the bored sides of the ports in the main valve, the latter having a steam-admission opening to the expansion-valve at each end, and an intermediate opening controlled by the middle disk, all arranged and operating substantially as herein described.



3. The combination, with a pair of single slide-valves, of a pair of expansion-valves D, consisting of a pair of disks and an intermediate disk fitted in rings and connected together by the feathers d^3, all arranged and operating substantially as herein described and shown.

405,788. SAFETY APPLIANCE FOR BOTTLES. LÉON L. METTEREAU, Bordeaux, France. Filed July 14, 1886. Renewed May 24, 1889. Serial No. 311,994. (No model.)

Claim.—The combination, with a bottle, of a safety appliance consisting of a band of tin-foil secured to a capsule of the same material and under a gummed label on the bottle, substantially as herein shown and described.

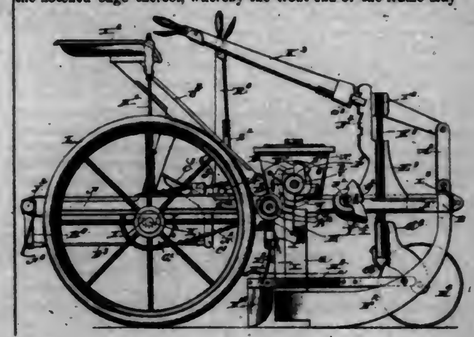
405,789. MUSIC-HOLDER. HARTWELL B. MOORE, Norwalk, Ohio. Filed July 20, 1888. Serial No. 280,625. (No model.)

Claim.—1. The combination, with the musical instrument and its outward-swinging panel hinged at its upper edge thereto, of a music-holder adjustable vertically on the rear face of the panel and adapted to move downward when the panel is swung outward, substantially as set forth.

2. The combination, with the musical instrument and its outward-swinging panel hinged at its upper edge thereto, of a music-holder adjustable vertically on the rear face of the panel, and a hinged connection between the instrument-casing and the said holder, substantially as set forth.

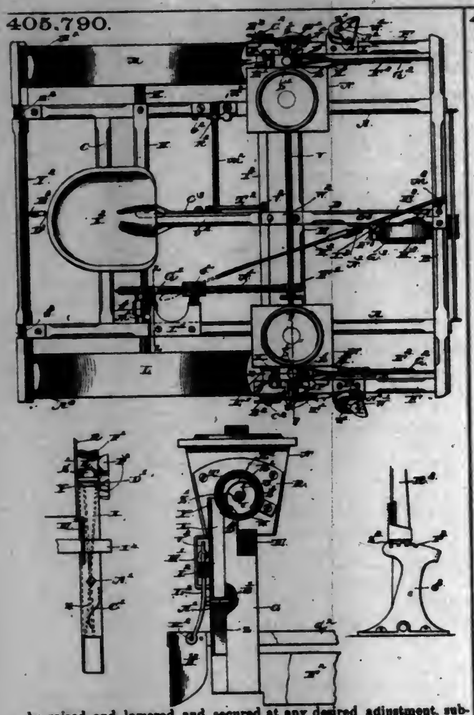
3. The combination, with the musical instrument having a panel hinged thereto at its upper edge to swing outwardly, and having a vertical guide on its rear face, of a vertically-sliding music-holder connected with the said guide, and a hinged connection between the sliding holder and the instrument-casing, substantially as set forth.

4. The combination, with a musical instrument of the character described, on a hinged panel provided with grooved blocks, the grooves being provided with felt, and a music-holder held to slide in said grooves, substantially as described.



5. In a music-holder for pianos and organs, the combination, with the casing, of a grooved panel hinged thereto, a music-holder having a foot-piece, said holder being adjustably engaged in the panel-grooves aforesaid, and a block having one side hinged to the music-holder and the other side hinged to the casing, substantially as shown and described.

6. The combination, in a music-holder, of the panel B, vertically grooved at the back thereof and hinged at its top to the piano-case, the music-holder E, held to slide in the grooves of the panel, and the block F, hinged to the rear of the holder E and to the piano-case, to limit the outward movement of said holder, substantially as described.



7. The combination, with the musical instrument, of a panel hinged thereto at its upper edge to swing outwardly, and a music-holder sliding in guides on the back of said panel and provided with a fixed foot or ledge along its lower edge projecting beyond the front of the panel when the latter is in its closed or opened position, substantially as set forth.

405,790. CORN-PLANTER. JOHN MORAN, Adair, Mo. Filed Mar. 8, 1889. Serial No. 302,425. (No model.)

Claim.—1. The combination, with a corn-planter, of the standard E^3, secured to the front part of the frame and having the tubular bearing and the notched arm N^3, the shaft F^6, journaled in the tubular bearing, the supporting wheel or roller journaled in a bearing at the lower end of said shaft, the swiveled sleeve at the upper end of said shaft, and the lever attached to said swiveled sleeve connected to the frame operating on the arm N^3 and having the devices to engage the notched edge thereof, whereby the front end of the frame may

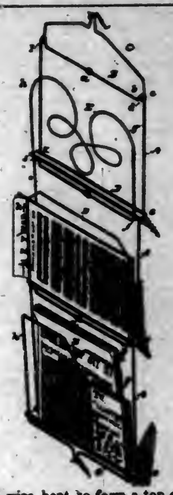
405,790.

be raised and lowered and secured at any desired adjustment, substantially as described.

2. The combination, in a corn-planter, of the hoppers having the discharge-openings in their sides and provided with the curved flanges T W above and below said openings, respectively, and the seed-wheels having the flanges concentric with and operating between said curved flanges T W, the said seed-wheels being further provided with the seed cups or openings in their said flanges, substantially as described.

3. The combination, in a planter, of the hoppers having the discharge-openings in their sides, the plates R, bolted to the sides of the hoppers and having the openings S registering with the discharge-openings, and provided, further, with flanges T, the spring-pressed brushes hinged to the rear lower sides of said flanges, and the flange-plates W, attached to the plates R and below the discharge-openings and concentric with the flanges T, the revolving shaft and the seed-wheels secured thereon and having the flanges bearing against the flanges T W and provided with the seed cups or openings, substantially as described.

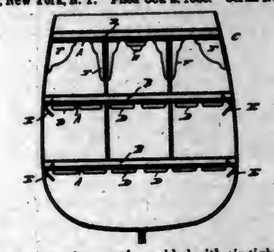
4. The plates W', having the arms X' and guard-plates Y', the same being struck up from a single piece of plate metal, and the guiding-pulley arranged between the parallel sides of the plate and the arm and journaled on a transverse bolt connecting the same, substantially as described.



5. The combination of the seed-boxes having openings in their outer sides, the plates secured thereto and having openings registering therewith, depending arms or brackets, and curved concentric plates or flanges or cut-offs, the transverse shaft journaled in the arms or brackets, the seed-wheels mounted on said shaft and having annular perforated flanges bearing against the concentric flanges or cut-offs, and the check-row wheels mounted on said shafts adjacent to the seed-wheels, substantially as set forth.

6. The combination, with the seed boxes or hoppers having openings in their outer sides and the transverse shaft extending through said hoppers, of the exteriorly-arranged seed-wheels having annular flanges provided with perforations or seed-cups bearing against curved concentric flanges or cut-offs attached to the seed-boxes, said seed-wheels being constructed with cams adapted to operate the drop-valves or cut-offs arranged in the seed-tubes, substantially as set forth

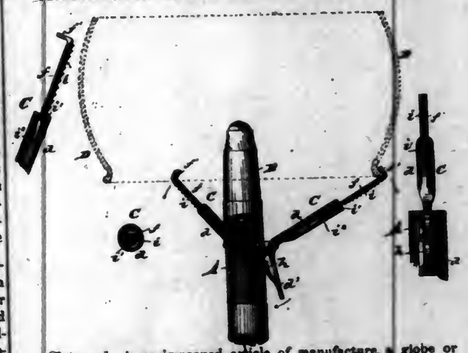
405,791. MUSIC OR PAPER HOLDER. LOUIS F. MOURNEY, Canton, Ohio. Filed Feb. 2, 1889. Serial No. 298,542. (No model.)



Claim.—As a new article of manufacture, a music or paper holder consisting of a series of frames hinged together, each frame constructed

405,791.

of a single piece of wire bent to form a top cross-piece, side pieces, and the front section *h g* of the pocket, substantially as set forth.

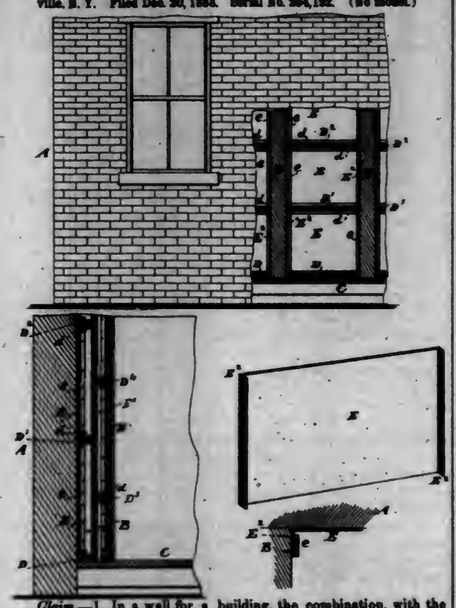


405,792. AIR-TIGHT CHAMBER IN VESSELS. FRIEDRICH D. F. MÖLLER, New York, N. Y. Filed Oct. 2, 1888. Serial No. 286,922. (No model.)

Claim.—1. A marine vessel provided with air-tight tanks located at the corners and ceilings of the cabins and saloons and shaped to form cornices and center-pieces, substantially as set forth.

2. The combination, with a marine vessel, of flat air-tight tanks secured to the under sides of the decks and V-shaped deflecting-plates secured to the hull of the vessel along the edges of the decks and partially covering said tanks, substantially as set forth.

405,793. GLOBE-HOLDER. JOHN J. MCGLONE, New York, N. Y. Filed Dec. 26, 1888. Serial No. 294,664. (No model.)

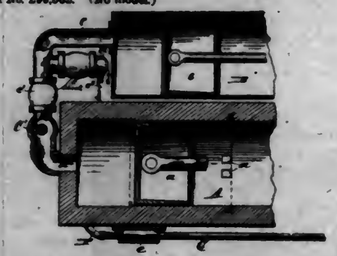


Claim.—1. As an improved article of manufacture, a globe or shade holder comprising a tube or sleeve, hollow spring-actuated arms pivoted thereto, and adjustable sections fitted in said pivoted arms, substantially as described.

2. The tube or sleeve A and the bent sections C, pivoted to the said tube A, the lower portion of said sections being acted upon by a spring, the upper portion being made hollow, in combination with

the adjustable section *f*, fitted in the hollow section, substantially as described.

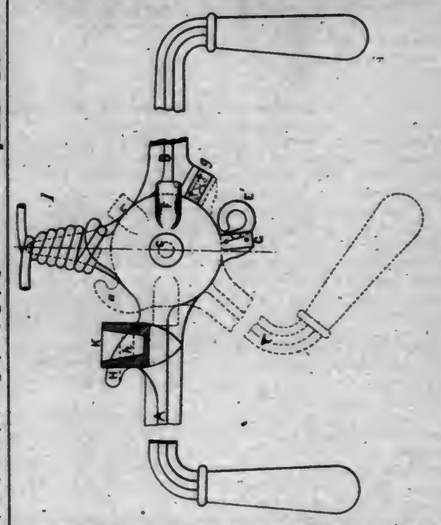
3. The tube A and the bent sections C, pivoted thereto and acted upon by springs A, in combination with the adjustable sections *f*, having a spring *d* and fitted in the bent sections, and formed with notches *i* to engage with the lip *i'* at the outer end of the bent sections, substantially as described.



405,794. CONSTRUCTION OF BUILDINGS. JOHN O'DONNELL, Lowville, N. Y. Filed Dec. 20, 1888. Serial No. 294,192. (No model.)

Claim.—1. In a wall for a building, the combination, with the outer wall A, the studs, and a series of strips between the studs, of a layer of paper between each two strips and a second series of strips and paper alternating with said strips, substantially as and for the purpose specified.

2. A wall for a frame building, composed of an outer and an inner wall and studs, cross-pieces between the studs, fitting close to the inside of the outer wall, thereby making an air-tight joint, alternating cross-pieces fitting closely with the inside face of the plaster or other material of the inside wall, thereby making an air-tight joint, paper having flanges, as shown, and strips of wood for holding said paper nailed to the studs, said strips being placed about one-fourth of an inch (more or less) from the inner corner of the angle of the paper or other equivalent material used, said flanged material and strips forming an air-tight joint between the cross-pieces and making complete dead-air cells, and giving the paper or other material used free play between the edges of the cross-pieces, thereby providing for the expansion or contraction of the material used or of the shrinkage of the studs.



405,795. GAS OR HYDROCARBON-VAPOR ENGINE. LEWIS C. PARKER and BEAUMONT PARKER, Kansas City, Mo. Filed Feb. 11, 1889. Serial No. 299,382. (No model.)

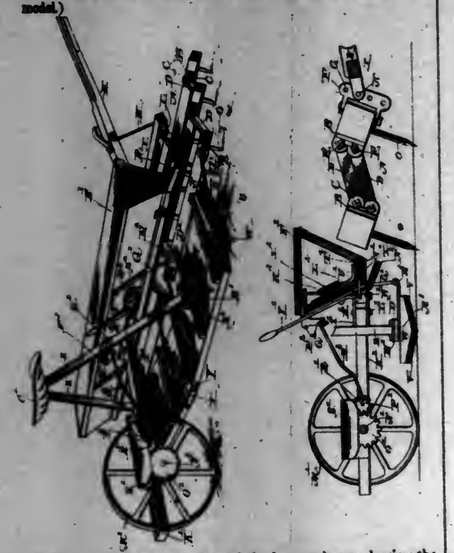
Claim.—1. In a gas or hydrocarbon-vapor engine, the combination, with the power-cylinder, the charging-cylinder, and their pistons, of the pipe or tube connection between them having an arm provided with an air-inlet and a gas-inlet and an automatic check-valve, said pipe or tube connection itself having a check-valve, the ignition-chamber provided with a valve seated in the lower open end of the heating-tube of said chamber, all arranged in the said tube or pipe connection, and means for operating said valve, substantially as and for the purpose specified.

2. In a gas or hydrocarbon-vapor engine, the combination of the power-cylinder, the charging-cylinder, and their pistons, the pipe or tube connection between said cylinders, said pipe or tube connection having an arm provided with an automatic check-valve and a gas-inlet and air-inlet, the additional check-valve also supplied to said pipe or tube connection, and the ignition-chamber having a heating-tube and a valve seating in the lower open end of said tube and having its stem extending through a guide-tube and provided inward from said valves with an enlargement or packing adapted to seat itself gas-tight around the inner end of the valve-stem guide-passage, the angle-lever having one arm acting upon the stem of the ignition-valve and its other arm acted upon by a cam-actuated rod, and the spring acting upon said angled lever to normally hold the ignition-valve closed, substantially as described.

405,796. IMPLEMENT FOR STRAINING WIRE. HENRY PERRIMAN, Essendon, and CHARLES F. ALDER, Melbourne, Victoria. Filed June 21, 1888. Serial No. 277,851. (No model.) Patented in Victoria Apr. 24, 1888, No. 5,781; in New Zealand Apr. 25, 1888, No. 2,946; in Queensland Apr. 27, 1888; in South Australia May 1, 1888, No. 1,014; in Tasmania May 19, 1888, No. 576, and in England June 7, 1888, No. 8,358.

Claim.—1. In a wire-stretcher, the combination, with parts A and B, the former provided with claw *a* and the latter with a tapering finger *b*, of screw-bolt C, serving as a pivot for said parts A and B, substantially as set forth.

2. In a wire-stretcher, the combination, with parts A and B, the former provided with claw *a* and the latter with tapering finger *b*, of screw-bolt C, serving as a pivot for said parts A and B, and spring-washer *d*, substantially as set forth.



3. In a wire-stretcher, the part A, provided with claw *a* and cutter G, and part B, provided with tapering finger *b* and cutter *g*, in combination with pivot-screw C, upon which said parts A and B turn, substantially as set forth.

4. In a wire-stretcher, the parts A and B, the former recessed on the inside and provided with a hub which operates within a central opening in part B, in combination with spring E, arranged within the recess of part A, around its hub, and provided with a handle exterior of said parts A and B, substantially as set forth.

5. In a wire-stretcher, the part A, provided with claw *a*, and part B, provided with tapering finger *b*, the said part A also provided with a perforated lug H, in combination with pivot-bolt C, substantially as set forth.

6. The wire-stretcher consisting of parts A and B, having the hook *a* and finger *b*, and bolt C, upon which said parts revolve, the said part A provided with a lug K, having a socket to receive an auger-bit therein, substantially as set forth.

405,797. HARROW, SEEDER, AND PLANTER. JAMES M. POORE, Spring Valley, Minn. Filed Nov. 30, 1888. Serial No. 292,302. (No model.)

Claim.—1. The combination of the harrow-beams having the ears C attached to and extending from their front and rear sides, near the ends, in pairs one above the other, with the links D, having their ends pivoted to the said ears, said links being arranged in parallel pairs, connecting the upper and lower ends of the beams, substantially as set forth.

2. The combination, with the harrow-beams and the links arranged in pairs, as described, and coupling or connecting said beams flexibly together, of the longitudinally-arranged rigid stiffening-bars and the keepers secured on the harrow-beams and receiving said stiffening-bars, substantially as set forth.

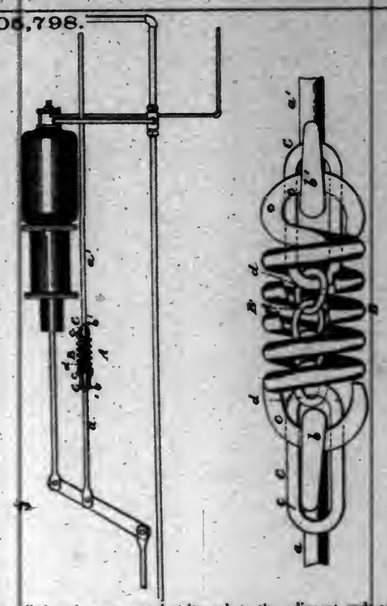
3. The combination of the smoother having forwardly-extending arms D', provided with eyes E', the hopper having the seed-stirring mechanism and provided with depending arms G', having inturned ends engaging the eyes E', the bar K', bolted between plates H', extending rearwardly from the hopper, the trailing wheel journaled in said bar, and mechanism for transmitting motion from said trailing wheel to the seed mechanism, substantially as set forth.

4. The combination of the harrow, the smoother connected to the rear end of the same and having plates D', provided with eyes E', the hopper having downwardly-extending arms provided with inturned ends engaging the eyes E', and a bar extending rearwardly from the hopper, and the trailing wheel journaled to said bar, substantially as and for the purpose set forth.

5. The combination of the smoother having the arms D', with eyes E', the hopper having the seed-stirring mechanism and the depending arms G', provided with hooks at their lower ends, the bar K', extending rearward from the hopper, the supporting-wheel journaled in said bar, and the gears and devices, substantially as set forth, connecting said wheels to the seed-stirring mechanism, the harrow arranged in advance of the smoother, and the hooked rods connecting the latter with the rear harrow-beam, substantially as described.

6. The hopper having the discharge-openings and the cut-off plate with openings X' and arm W', in combination with a cam B', forming a stop for said arm, and devices to secure the cam at any desired adjustment, substantially as described.

7. The hopper having the discharge-openings and the cut-off plate with openings X' and arm W', in combination with the cam or eccentric forming a stop for the said arm and provided with the hand or pointer, and the graduated scale, substantially as described.

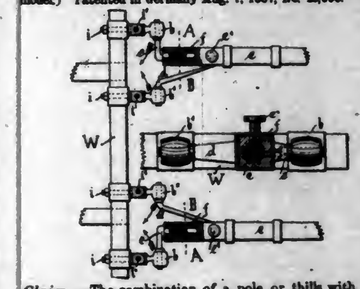


8. The smoother-sections composed of a pair of boards V, arranged at an obtuse angle, and transverse cleats bolted on the said boards and serving to hold them together, as set forth.

9. The smoother composed of sections U, having their inner meeting ends rabbeted, and thereby caused to overlap, and the links X, connecting these sections at the point where they overlap, as set forth.

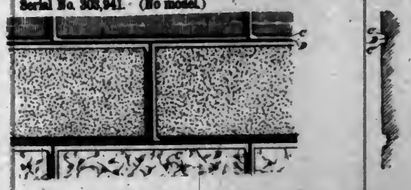
405,798. ATTACHMENT FOR BRAKE-RODS. NOAH C. PRICE, Pocatello, Idaho. Filed Apr. 4, 1888. Serial No. 305,974. (No model.)

Claim.—1. The combination, with the two parts of the rod, of



405,798.

the coiled spring connected at its ends to the adjacent ends of said two parts, and the safety-chain arranged within the spring independent of and disconnected from said spring and having at each end elongated loops loosely held in the hooks of the two parts of the rod, substantially as shown and described.



2. The combination, with the two parts of the rod having hooked ends, and the coiled spring connecting the same, and the normally-inactive safety-chain and links independent of the rod and spring and arranged within the coils of said spring and disconnected therefrom, with the end links loosely engaging the hooks of the rods, substantially as shown and described, and for the purpose specified.

405,799. MECHANISM FOR DETACHING THILLS. ALBERT RAMMOSER, Berlin, Germany. Filed Mar. 22, 1889. Serial No. 304,429. (No model.) Patented in Germany Aug. 7, 1887, No. 42,666.

Claim.—The combination of a pole or thills with two lateral pivots *c* and *d*, one of which *c* has a rotary motion in its place in the thills, which pivots are inserted into two sockets *b b'*, attached by means of swivel-shanks to the front beam of the vehicle and revolving at the same time on a vertical axle, substantially as and for the purpose herein shown and described.

405,800. FINISHING CONCRETE AND ARTIFICIAL-STONE SURFACES. ERNEST L. RAMSOME, San Francisco, Cal. Filed Mar. 19, 1889. Serial No. 303,941. (No model.)

Claim.—1. A concrete or artificial-stone surface having a superficial joint line or border, and having the intermediate surface cut or broken, substantially as herein described.

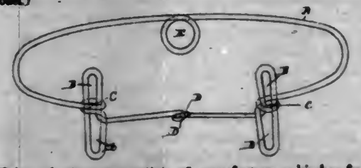
2. The improvement in artificial-stone walls or surfaces consisting of the superficial joint or border formed by projections in the mold and the intermediate faces of the subdivisions subsequently broken or dressed by a tool, substantially as herein described.

3. A concrete or artificial-stone surface having superficial finished joint lines or borders, with the intermediate surface cut or broken, substantially as described.

405,801. MERCHANDISE-BOX. GEORGE E. RAYMOND, Chicago, Ill. Filed Feb. 9, 1889. Serial No. 299,283. (No model.)

Claim.—1. The packing or merchandise box or case having the sliding spout or chute, combined with the pivoted or hinged flap or cover, the same being connected by a spring, substantially as specified.

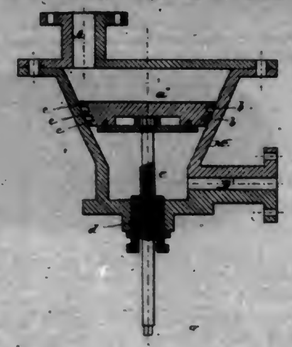
2. The packing or merchandise box or case having the sliding or movable chute or spout, combined with a flap or cover hinged or pivoted to the box or case and connected to the spout or chute through the medium of a spring-wire, and a slide arranged upon the inside of the box or case and having connection with said spout or chute by a stud passed through a slot in the casing or box, substantially as specified.



405,802. SAD-IRON. AUGUST REINER, Cleveland, Ohio. Filed July 9, 1888. Serial No. 279,366. (No model.)

Claim.—1. A sad-iron provided with an imperforated hood covering the iron and rising gradually in respect to the base of the iron from the point to the wheel and having an extension, as *b*, at its rear, in combination with a shoe within the hood closed down upon the base at its sides and provided with perforations about its inner end, and a gas-conveying tube extending within the shoe and perforated at its bottom, substantially as set forth.

2. In a sad-iron, a hood over the iron substantially convex in cross-section and closed against the escape of heat except at the heel of the iron, a shoe set in the hood apart from the same to leave an air-draft between said parts, said shoe having perforations at its inner end opening into said air-space, and openings at its rear for the admission of air, in combination with a gas-tube extending into the said shoe and supported thereby, said tube having perforations on its bottom, substantially as set forth.

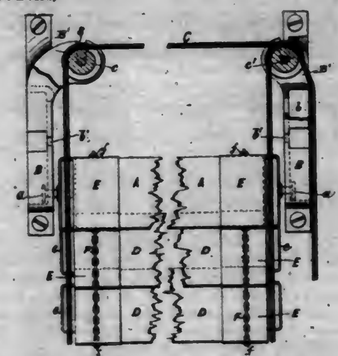


405,803. BINDER FOR CORN-FODDER. SAMUEL T. RENNEKAR, New Cumberland, Ohio. Filed Dec. 18, 1888. Serial No. 294,019. (No model.)

Claim.—1. As a new article of manufacture, a binder for corn-fodder, the same being made of wire bent at its ends to form hooks adapted to engage with each other, and intermediate its ends to form hand-holds consisting of lateral loops projecting at substantially right angles from the wire, substantially as described.

2. As a new article of manufacture, a wire binder provided at its ends with hooks and at a suitable distance from each end bent to form loops B, projecting in opposite directions and at right angles to the wire, and also bent to form the rings C, encircling said loops, substantially as described.

405,804. STEAM-TRAP. CHARLES RICHARD, Paris, France. Filed Nov. 26, 1888. Serial No. 291,946. (No model.) Patented in France Feb. 13, 1885, No. 167,914; in England Sept. 8, 1885, No. 10,630, and Feb. 17, 1887, No. 2,500, and in Belgium Jan. 11, 1888, No. 71,571.



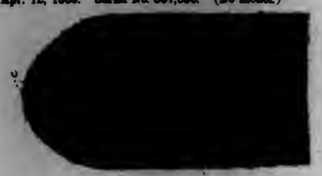
Claim.—1. In a self-acting steam-trap, the combination, with a conical or tapered casing, of a series of connected plates or disks situated at different points in said casing, of correspondingly-different diameters, and adapted to form, in conjunction with the casing, successive discharge-openings for the steam, substantially as set forth.

2. In a self-acting steam-trap, the combination, with a conical or tapered casing, of a series of connected plates or disks of a material more extensible by heat than is the material of the casing, situated at different points in said casing, of correspondingly-different diameters, and adapted to form, in conjunction with the casing, successive discharge-openings for the steam, substantially as set forth.

3. In a self-acting steam-trap, the combination, with a conical or tapered casing, of a series of connected plates or disks situated at different points in said casing, of correspondingly-different diameters, and adapted to form, in conjunction with the casing, successive discharge-openings for the steam, and a chamber in which the steam expands before acting upon said disks, substantially as set forth.

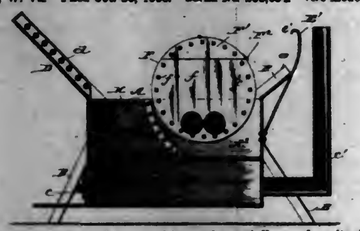
4. The combination, with the tapered casing, of the series of connected disks or plates having the edges *c* adapted to fit the casing and form successive discharge-openings for the steam, as described, bushing *d*, threaded externally and internally, and the threaded stem *e*, connected with the disks and engaging the bushing, substantially as set forth.

405,805. VENETIAN BLIND. ANDREW SMITH, East Dulwich, County of Surrey, England. Filed Jan. 16, 1889. Serial No. 296,532. (No model.)



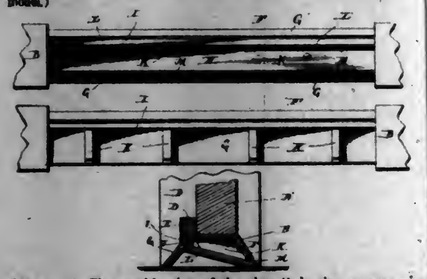
Claim.—1. The combination, with a Venetian blind, of brackets disposed at opposite sides of the window-casing, both of said brackets being provided with elongated vertical slots in which the gudgeons of the top slat of said blind are vertically movable, and with bearings above said slots, pulleys supported in said bearings, and lifting-cords passing over said pulleys and connected with said blind at opposite ends of the slats thereof, whereby the blind may be vertically adjusted bodily.

2. The combination, with a Venetian blind, of brackets disposed at opposite sides of the window-casing, both of said brackets being provided with elongated vertical slots in which the gudgeons of the



top slat of said blind are vertically movable, and with slotted bearings above said slots, detachable pulleys supported in said slotted bearings, and lifting-cords passing over said pulleys and connected with said blind at opposite ends of the slats thereof, whereby the blind may be vertically adjusted bodily.

405,806. BATHING-MITTEN. JUDSON S. SNYDER, Brooklyn, N. Y. Filed Apr. 12, 1889. Serial No. 307,090. (No model.)



Claim.—A bathing-mitten formed of an unsplit and seamless luffa-fruit having its core and pulp removed, and having one of its ends drawn together, substantially as specified.

405,807. WASHING-MACHINE. ROBERT P. STARBUCK, Harrisville, W. Va. Filed Oct. 20, 1888. Serial No. 288,654. (No model.)

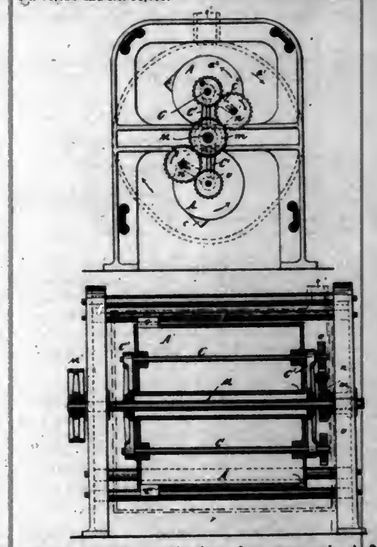
Claim.—In a washing-machine, substantially as described, the combination, with the suds-box having a cylinder-compartment and an open compartment, and an upright E', having a hook *e'*, and arranged at the end of such suds-box opposite the open compartment, of the cylinder operating in the cylinder-compartment and having a door-section arranged when open to be supported by upright E' and be engaged by the hook *e'* thereof, whereby the cylinder will be held from turning forward toward the open compartment by the dragging of clothes out of such cylinder into such open compartment, substantially as set forth.

405,808. WEATHER-STRIP AND DOOR-SILL COMBINED. HENRY W. STELLER, Easton, Pa. Filed Oct. 31, 1888. Serial No. 289,584. (No model.)

Claim.—1. The combination of the plate G, having an upper inclined surface, a strip I, secured on the upper side of the said plate G, and the plate H removably secured upon the plate G on a level with the strip I, and having its upper inner edge arranged a slight distance from the strip I and its lower outer edge arranged a slight distance above the upper side of the plate G, as set forth.

2. The combination of the plate G, having an upper inclined side, and the lugs K on said side, the strip I, secured upon the plate G, and the plate H, removably supported above the plate G on a level with the strip I and resting upon the lugs K, and having its lower outer edge terminating above the plate G and its inner upper edge arranged a slight distance from the strip I, as set forth.

3. As an improvement in weather-strips, the combination of the plate G, having an upper inclined side and provided with the lugs K, the vertical strip I, secured to the plate G, thereby forming the shoulder J, the flexible strip secured to the door and fitting against the shoulder J, and the plate H, resting on the lugs K and having its lower outer edge arranged a slight distance above the plate G and its upper inner edge arranged a slight distance from the strip I, as specified.

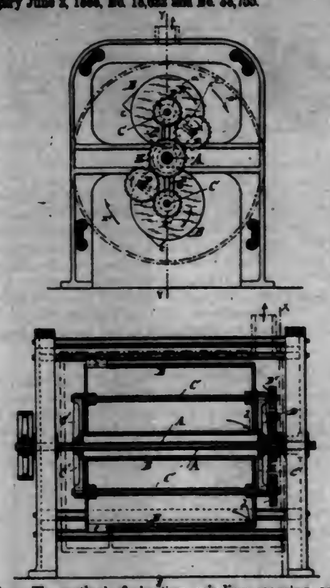


405,809. INSCRIPTION AND MOTTO PLATE. CHARLES M. UNDERWOOD, Hamilton, Ontario, Canada. Filed Mar. 7, 1889. Serial No. 302,254. (No model.)

Claim.—1. An inscription or motto plate consisting of a main frame having a depressed panel-plate between two perpendicular slits, a letter-case to fit in said panel, having its side walls bent upward and inward for the reception of letter-blocks, and having bent prongs at each end, and letter-blocks and blank-blocks to place in said letter-case, all substantially as set forth.

2. A letter-case adapted to be inserted within a frame having its side walls bent upward and inward, forming grooves or channels to hold blocks with letters or designs on their face-surface, also having a bent prong at each end for the purpose of fastening itself to a plate or frame, substantially as set forth.

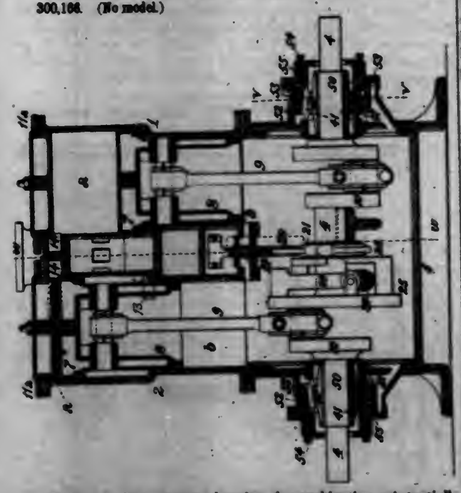
405,810. HULLING OR GRINDING MACHINE. FRIEDRICH WEGMANN, Zurich, Switzerland. Filed Aug. 18, 1887. Serial No. 247,359. (No model.) Patented in Germany July 20, 1887, No. 44,396; in France July 25, 1887, No. 184,981; in Belgium July 26, 1887, No. 78,347; in England July 27, 1887, No. 10,456; in Italy Sept. 20, 1887, No. 22,105; in Spain Nov. 20, 1887, No. 11,744, and in Austria-Hungary June 2, 1888, No. 18,622 and No. 38,755.



Claim.—1. The combination of a rotary main shaft, a drum or drums mounted eccentrically to said shaft, so as to revolve around the same, and transmitting mechanism between the main shaft and the drum or drums, whereby the drum or drums are rotated on their own axes in a direction opposite to their revolving motion around the main shaft, substantially as set forth.

2. The combination of a rotary main shaft, a drum or drums mounted eccentrically to said shaft, so as to revolve around the same, and planetary gearing for rotating the drum or drums axially in opposite direction to their revolving motion around the main shaft, substantially as herein shown and described.

3. The combination of a supporting-frame, a rotary main shaft journaled in the same, a drum or drums mounted eccentrically to said shaft, so as to revolve around the same, a stationary gear-wheel mounted on the frame, and planetary gear-wheels meshing with said stationary gear-wheel for imparting rotary motion to the drum or drums axially in a direction opposite to their revolving motion around the main shaft, substantially as herein shown and described.



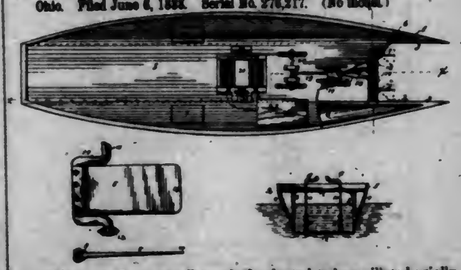
4. The combination, with a supporting-frame, of a rotary main shaft journaled in the same, arms fixed on said shaft, drums journaled on the arms, a stationary gear-wheel mounted on the frame, a cog-wheel on each drum-shaft, and intermediate cog-wheels journaled in the arms and meshing with the stationary gear-wheel and the cog-wheels on the drum-shafts, substantially as herein shown and described.

405,811. METHOD OF GRINDING AND SCOURING GRAIN. FRIEDRICH WEGMANN, Zurich, Switzerland. Filed May 26, 1888. Serial No. 275,316. (No model.) Patented in Germany July 20, 1887, No. 44,396; in France July 25, 1887, No. 184,981; in Belgium July 26, 1887, No. 78,347; in England July 27, 1887, No. 10,456; in Italy Sept. 20, 1887, No. 22,105; in Spain Nov. 20, 1887, No. 11,744, and in Austria-Hungary June 2, 1888, No. 18,622 and No. 38,755.

Claim.—The method of cleaning, grinding, scouring, or decorticating grain or similar material, which consists in subjecting a mass of such material while in contact with an abrading-surface simultaneously to the action of two centrifugal forces generated in opposite directions from different centers, whereby said mass is held in contact with the abrading-surface and the particles thereof shifted relatively to each other, substantially as set forth.

405,812. COMPOUND ENGINE. GEORGE WESTINGHOUSE, Jr., and FRANCIS M. RITER, Pittsburg, Pa. Filed Feb. 16, 1889. Serial No. 300,166. (No model.)

Claim.—1. In a compound engine, the combination, substantially as set forth, of two cylinders each bored out to a larger and a smaller diameter in the upper and lower portions, respectively, of its length, trunk-pistons fitting said cylinders, a crank-shaft journaled in bearings below the cylinders and provided with oppositely-set cranks, connecting-rods coupling the pistons to the pins of said cranks, and two distribution-valves which are reciprocated in respectively opposite directions by connections from the crank-shaft, each of said valves controlling the supply and exhaust ports of one of the cylinders.



2. In a compound engine, the combination, substantially as set forth, of two cylinders each bored out to a larger and a smaller diameter in the upper and lower portions, respectively, of its length, trunk-pistons fitting said cylinders, a crank-shaft journaled in bearings below the cylinders and provided with oppositely-set cranks, connecting-rods coupling the pistons to the pins of said cranks, two distribution-valves each controlling the supply and exhaust ports of one of the cylinders, and a single automatic cut-off mechanism coupled to and actuating said distribution-valves.

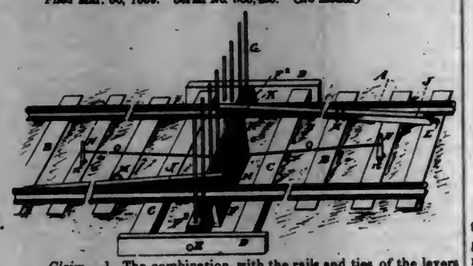
3. In a compound engine, the combination, substantially as set forth, of two cylinders, each bored out to a larger and a smaller diameter in the upper and lower portions, respectively, of its length, trunk-pistons fitting said cylinders, a crank-shaft journaled in bearings below the cylinders and provided with oppositely-set cranks, connecting-rods coupling the pistons to the pins of said cranks, two distribution-valves each controlling the supply and exhaust ports of one of the cylinders, a centrifugal governor or regulator fixed upon the crank, an adjustable eccentric which is coupled to and varied in position by the governor, and an oscillating rocker having its arms coupled to the strap of said eccentric and to the stems of the distribution-valves.

4. In a compound engine, the combination, substantially as set forth, of two cylinders, each bored out to a larger and a smaller diameter in the upper and lower portions, respectively, of its length, trunk-pistons fitting said cylinders, a crank-shaft journaled in bearings below the cylinders and provided with oppositely-set cranks, connecting-rods coupling the pistons to the pins of said cranks, two distribution-valves which are reciprocated in respectively opposite directions by connections from the crank-shaft, each controlling the supply and exhaust ports of one of the cylinders, and an inertia balance composed of two pistons each working in a cylinder containing expansive fluid, said pistons being coupled one to the other and to the stems of the distribution-valves, so as to be reciprocated coincidently with said valves and to effect alternate expansion and compression of the fluid in the cylinders.

5. In a compound engine, the combination, substantially as set forth, of two cylinders each bored out to a larger and a smaller diameter in the upper and lower portions, respectively, of its length, trunk-pistons fitting said cylinders, a crank-shaft journaled in bearings below the cylinders and provided with oppositely-set cranks, connecting-rods coupling the pistons to the pins of said cranks, two valve-chests communicating by ports one with the other and with a common supply-pipe and communicating independently with a common exhaust-pipe, ports leading from each valve-chest into one of the cylinders adjacent to opposite ends of its larger bore, and a pair of distribution-valves reciprocating in the valve-chests, each of said valves having a tubular body, a pair of end pistons, and a series of ports interposed between the body and the end pistons, said valves being adapted to supply steam to the lower cylinder-ports from the spaces around their bodies to transfer steam through their ports and bodies from the lower to the upper cylinder-ports and to exhaust steam from the upper cylinder-ports by their upper end pistons.

405,813. VIBRATING PROPELLER. FRANK D. WHIPP, Cleveland, Ohio. Filed June 6, 1888. Serial No. 276,217. (No model.)

Claim.—1. In a propeller, a shaft adapted to be oscillated axially and having a crank formed therein, with a flexible propeller-blade attached to the crank, substantially as set forth.



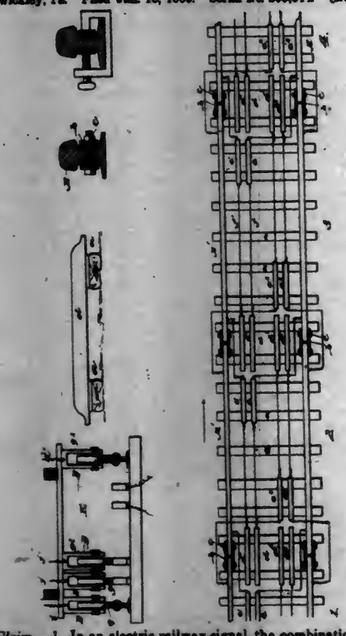
2. In a propeller, a shaft to operate the blade, having a crank formed to extend forward of the axis of the shaft, and a blade rigidly attached to said crank, substantially as set forth.

3. The combination of two floats having straight inner sides opposite each other, with a propelling-blade between the floats, and a

shaft for operating the blade, having a crank to which the blade is attached, substantially as set forth.

4. The combination of two floats, a shaft set vertically between the floats, and a flexible blade attached rigidly to a crank on said shaft, which extends forward of the axis of the shaft, substantially as set forth.

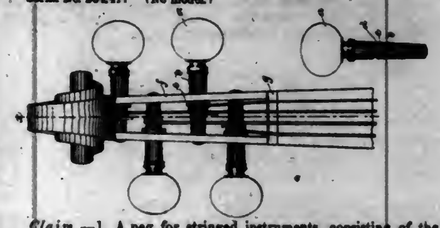
405,814. RAILWAY-GATE. ISAAC WESHAM, Stover's Shops, Va. Filed Mar. 30, 1889. Serial No. 305,425. (No model.)



Claim.—1. The combination, with the rails and ties, of the levers J J, pivoted at one end to the ties, the gate pivoted, as described, and the rollers journaled on the gate with the free ends of the levers resting thereon, substantially as shown and described.

2. The combination, with the rails and ties, of the levers J J, pivoted at one end to the ties, the gate pivoted, as described, the rollers journaled on the gate with the free ends of the levers resting thereon, and the wire guides for the levers secured to the ties, substantially as described.

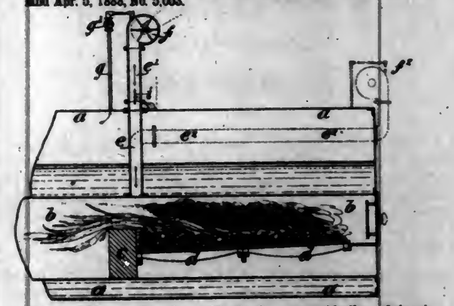
3. The combination, with the rails, ties, and transverse gate pivoted, as described, of the rollers journaled on said gate, the guides M on the ties, and the levers J J, pivoted at one end and enlarged at the other with the enlarged ends bearing on the said rollers, substantially as shown and described, and for the purpose specified.



405,815. ELECTRICAL RAILWAY-SIGNAL. JAMES C. WHITE, Sewickley, Pa. Filed Jan. 10, 1889. Serial No. 296,914. (No model.)

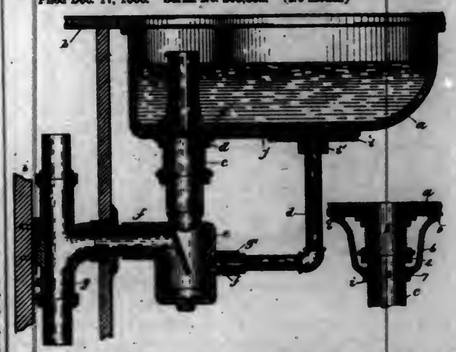
Claim.—1. In an electric railway-signal, the combination, with a railroad-track divided into sections insulated from each other, of four contact-rails arranged in pairs in each section and connected together and to the track-rails of the next section, one pair of the contact-rails being opposite the joints of the sections, hangers suspended from the locomotive, contact-wheels journaled in the hangers, a bell and battery on the locomotive, and wires extending from the said hangers to the bell and battery, substantially as herein shown and described.

2. In an electric railway-signal, the combination of the track-rails A A', contact-rails $d d' c c'$, the hangers D, contact-wheels $g f g^3 g^4$, battery F, electric bell G, and the electric connections, substantially as specified.



405,816. PEG FOR VIOLINS. MAURICE W. WHITE, Boston, Mass., assignor of one-half to George W. Ross, same place. Filed Sept. 3, 1888. Serial No. 284,411. (No model.)

Claim.—1. A peg for stringed instruments, consisting of the thumb-piece *a* and shank *b*, having the string-receiving hole *c* and the groove *d*, substantially in line with and to partially include the string-receiving hole, substantially as and for the purposes specified.

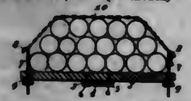


2. A peg for stringed instruments, comprising the thumb-piece *a* and tapering shank *b*, combined with the independent washer *e*, mounted loosely on the shank, one side of which bears against the inner wall of the cheek-piece *f* and the opposite side of which is acted upon by the string, substantially as and for the purposes specified.

405,817. PROMOTING COMBUSTION IN FURNACES. WILLIAM P. WHITE, Manchester, and ROBERT WALLBANK, Bolton-le-Moors, County of Lancaster, assignors to James Henry Heap, Accrington, England. Filed Dec. 20, 1888. Serial No. 294,221. (No model.) Patented in England Apr. 5, 1888, No. 5,053.

Claim.—The combination, with the furnace and boiler, of the air-pipe leading through the boiler and delivering into the furnace-flue, as described, the fan *f* and its casing situated at the outer end of said pipe, and the steam-pipe *g*, extending from the boiler and delivering a steam-jet for actuating said fan, substantially as described.

405,818. SET BOWL OR BASIN. JAMES BARRETT, Boston, Mass. Filed Dec. 17, 1888. Serial No. 293,532. (No model.)



Claim.—1. A set bowl or basin adapted to be applied to and beneath a slab, combined with waste fixtures, substantially such as set forth, and an interposed nut bearing against the bottom of the bowl or basin and adjustable relatively thereto to force the bowl or basin into intimate contact with the slab and hold it in such position, substantially as shown and described.

2. A set bowl or basin adapted to be applied to and beneath a slab, the waste-pipe, and a trap in said waste-pipe, combined with a brace connected to said trap, and a nut arranged on the upper end of said brace and in intimate contact with the bottom of the bowl or basin and adjustable on said brace and relatively to the bowl or basin to force the bowl or basin into contact with the slab and hold it in such position, substantially as shown and described.

3. A set bowl or basin adapted to be applied to and beneath a slab, the waste-pipe, and a trap in said waste-pipe provided with a screw-threaded boss, combined with a brace coupled to said boss, and a nut arranged on the upper end of said brace and in intimate contact with the bottom of the bowl or basin and adjustable on said brace and relatively to the bowl or basin to force the bowl or basin into contact with the slab and hold it in such position, substantially as shown and described.

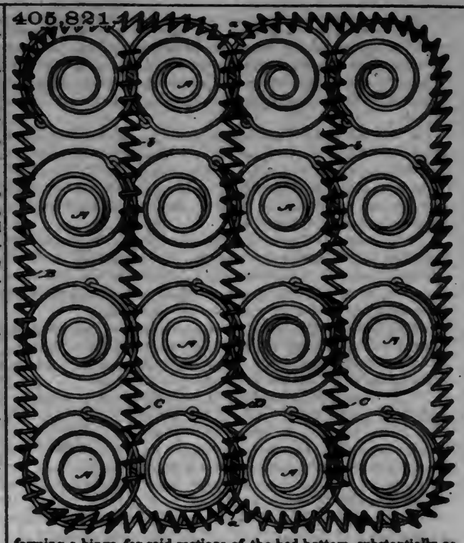
4. A set bowl or basin adapted to be applied to and beneath a slab and provided with a flat seat *j* on its under side, combined with a waste-pipe, a trap therein, a brace connected to the said trap, and a nut arranged upon said brace and adjustable thereupon and fitted to or against the said flat seat of the bowl or basin to force the said bowl or basin into intimate contact with the superposed slab, substantially as shown and described.

405,819. WAGON-GEAR. GEORGE S. BILLINGS, Lyons, Colo. Filed July 17, 1888. Serial No. 280,227. (No model.)

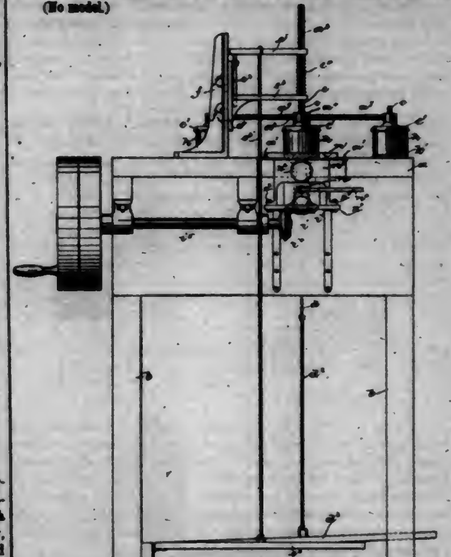
Claim.—1. The combination, with the running-gear of a wagon and the ordinary bolsters thereof, of an additional or intermediate or binding bolster provided with hooked and threaded standards, substantially as set forth.

2. An additional or intermediate or binding bolster for use with a wagon-gear, consisting of a bolster or bar 5 and standards 7 7, each of the latter having a hook 8, a threaded portion, and a nut 9, substantially as set forth.

405,820. CASH-FARE TICKET. ALLEN I. BLANCHARD, Chicago, Ill. Filed June 18, 1887. Serial No. 241,701. (No model.)



Claim.—A cash-fare ticket provided with a division-line of perforations, having on one side of said line words or characters indicating dollars, dimes, and cents, and on the other side of said line a complete set of numerals opposite each of said designations, whereby, when any of said figures are punched out and the ticket separated on the perforated line, the punched figures will adhere to one part and all of the rest of the figures to the other part of the ticket, substantially as and for the purpose set forth.



405,821. BED-SPRING. ELLIOTT M. ROSSELL and JOHN S. LARIMER, Corry, Pa. Filed Jan. 10, 1888. Serial No. 260,978. (No model.)

Claim.—1. A bed-bottom consisting of helical or other springs, a spiral marginal wire wrapped loosely around the outer portion of the top and bottom whirls of each spring, intermediate spiral parallel wires C, uniting the adjacent portions of the top and bottom whirls, and a similar spiral wire on but one side of the bed-bottom, serving the twofold function of connecting the sections of the springs and forming a hinge for said sections of the bed-bottom, substantially as specified.

2. A spring bed-bottom formed in sections and having the top whirls of springs at the adjacent ends of the sections united by a spiral wire wound loosely around them, so as to allow the sections to fold and yet afford a yielding connection, substantially as specified.

405,822. MACHINE FOR SOLDERING END PIECES ON CANS. JAMES A. BOOTH, Boston, Mass. Filed Dec. 10, 1888. Serial No. 293,033. (No model.)

Claim.—1. In a machine for securing end pieces to cans, the recessed can-holder to receive and hold one end of the can-body, combined with the live and dead spindles separated and independent of each other, to receive between them the said can-holder and the can held by it, with the bottom of the can resting on the top of said live-spindle, substantially as described.

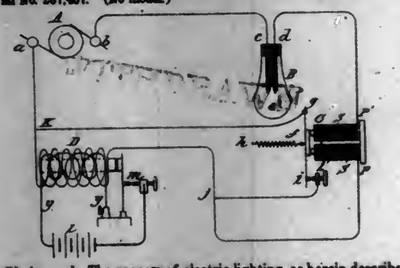
2. In a machine for securing end pieces to cans, the recessed can-holder and the bearing in which it freely turns, combined with the live and dead spindles, one of which is movable in the direction of its length, whereby the said can-holder and can held by it may be received between the spindles and rotated, substantially as described.

3. In a machine for securing end pieces to cans, the recessed rotatable independent and removable can-holder, combined with the live-spindle, the normally-raised dead-spindle and its spring, the arm carrying it, and means, substantially as described, for lowering said dead-spindle against the action of said spring, substantially as described.

4. In a machine for securing end pieces to cans, the independent rotatable vertically-movable can-holder and the live-spindle, combined with the dead-spindle, the arm carrying it, and the vertically-movable frame for said dead-spindle, whereby said dead-spindle may be pressed upon the said can-holder to retain the can between it and the live-spindle, substantially as described.

5. In a machine for securing end pieces to cans, the independent removable and rotatable can-holder and the dead-spindle, combined with the live-spindle, independent thereof and having the disk *i* upon its upper end, in which the can-body is placed, and the rotatable shaft for revolving said live-spindle, substantially as described.

6. In a machine for securing end pieces to cans, the independent recessed and rotatable can-holder and live and dead spindles, combined with the heated solder-plate *n*, placed adjacent to and partially surrounding one of the spindles, substantially as described.



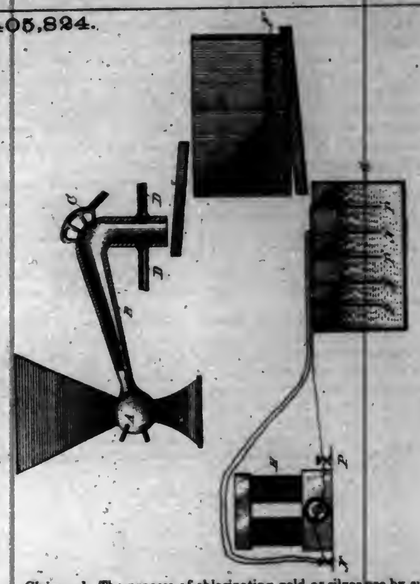
7. In a machine for securing end pieces to cans, the recessed can-holder and spindles by which it and the can held by it are rotated when placed between the same, combined with the solder-plate *n*, having the semicircular can-receiving recess, the annular groove therein, and the solder-delivery recess leading from the top of the plate *n* to the can-receiving recess just above the annular groove therein, substantially as described.

8. In a machine for securing end pieces to cans, the horizontally-movable block a^3, the upright rod, the hub a^4 on said rod, and a plurality of arms radiating therefrom, combined with a rotatable can-holder carried by each arm, and the plate *n*, having a curved recess therein, substantially as described.

9. In a machine for securing end pieces to cans, the block a^3, the rod a^2 and hub a^4 thereon, and a plurality of arms radiating from said hub, combined with recessed disks *c'*, having shanks *c*, which serve as can-holders, and the plate *n*, having a curved recess therein, substantially as described.

10. In a machine for securing end pieces to cans, the horizontally-movable block a^3, rod a^2, hub a^4 thereon, and a plurality of arms radiating from said hub, combined with the can-holders carried by said arms and the spindles between which the can-holders successively enter, and the plate *n*, having a curved recess concentric with and partly surrounding one of said spindles, substantially as described.

405,828. ELECTRIC CANDLE. TURNER D. BOTTOME, Hoosick, N. Y., assignor to John B. Tibbits, same place. Filed Oct. 6, 1888. Serial No. 287,407. (No model.)



Claim.—1. The process of electric lighting, as herein described, which consists in electrically connecting the terminals of an electric candle with two sources of electric energy, one of high electro-motive force, the other of low electro-motive force, the latter comprising the working-circuit, whereby the resistance caused by the separation of the carbons or electrodes is overcome by the first-named current, thus forming a path or circuit by which the low electro-motive-force current can follow and produce the light.

2. The process of electric lighting, consisting in subjecting the terminals of an electric candle to the action of a high electro-motive-force current while in circuit with a low electro-motive-force current, which follows the path formed by the first-named current, it having caused the resistance to be overcome, as herein described.

3. The process of forming an electric arc, which consists in causing a low-voltage, large-quantity current to pass between the terminals of an electric candle by first causing the resistance between such terminals to be lowered by the sparking action of a high electro-motive-force current, substantially as described.

405,824. PROCESS OF CHLORIDIZING GOLD ORES. TURNER D. BOTTOME, Hoosick, N. Y., assignor to John B. Tibbits, same place. Filed Dec. 28, 1888. Serial No. 294,853. (No specimens.)

Claim.—1. The process of chlorinating gold or silver ore by submitting the comminuted and dissociated ore to the action of dampened chlorine gas, dissolving the chlorides formed thereby in a solution of sodium thiosulphate, and reducing the metallic thiosulphates by electrolysis, substantially as described.

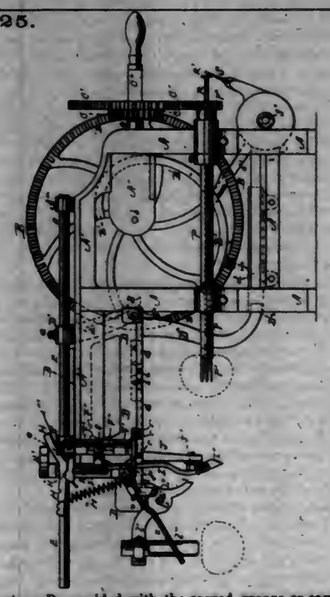
2. The process of recovering precious metals from their ores, consisting in pulverizing the ores to an impalpable powder with superheated steam, treating the warm disseminated floating ore with sprays of dampened chlorine, wetting the chlorinated ore with a solution of a thiosulphate, and subjecting the filtered liquor to the action of electrolysis, substantially as described.

3. The process of effecting a thorough and continuous chlorination of gold and silver bearing ores by submitting the finely-pulverized floating disseminated ore to the action of dampened chlorine gas, substantially for the purpose as herein described.

4. The process of treating ores of the precious metals, consisting in pulverizing the ores to an impalpable powder by superheated steam, forcing the powdered ore through a spacious chamber while subjecting the disseminated ore to the action of dampened chlorine, which is forced into the said chamber by means of atomizers, dissolving out the metallic chlorides formed thereby by submitting the powdered chlorinated ore to a bath of a strong thiosulphate-liquor, filtering the resulting metallic thiosulphate solution and subjecting it to electrolysis, substantially as herein described.

405,825. APPLE PARER, CORER, AND SLICER. WILLIAM H BOUTELL, Antrim, N. H., assignor to Charles W. Kalmes, same place. Filed Mar. 31, 1888. Serial No. 269,058. (Model.)

Claim.—1. The combination of the rod I with the paring device, lever H, spring H", arm *f*, rod F", supported in a suitable bracket, and adjustable rest 7, adapted to be moved vertically on said rod, substantially as and for the purpose described.



2. The combination of the rod I with the paring device, lever H, pivotally supported by a suitable bracket, said bracket being rigidly secured to a sliding carriage, and the bar K, provided with the horizontal projection K', secured to the frame of the machine, substantially as and for the purpose set forth.

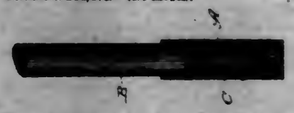
3. The combination of the frame A with the rack-bar G, having teeth 6, and the carriage D, provided with the bracket F F' and rod F", to which is rigidly secured the bifurcated arm *f* and slotted arm *f'*, said slotted arm being provided with the sprockets 5, the lever H, spring H", rod I, and the paring device, substantially as and for the purpose described.

4. The combination, with the frame or stationary portion of the machine, to which is rigidly secured the stud or pin N, of the carriage D, provided with the bracket 9, and the support L, pivotally secured to said bracket for engagement with said stud, the arms *l l*, adapted to slide under the rack G, and the arm *l'*, to which is secured the corer, substantially as and for the purpose described.

5. The combination of the frame A A', the gear-wheel B, provided with the stud B", the cam B', rigid with said gear-wheel, the

405,825.

sliding carriage D, provided with the curved groove or cam-groove *d'*, the leg D", and the stud 2, rigidly secured to said carriage, substantially as and for the purpose set forth.

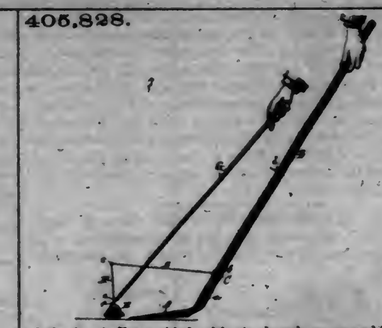


405,826. ROAD-CART. JOHN W. BROWN, Rock Falls, Ill. Filed Mar. 30, 1888. Renewed Apr. 19, 1889. Serial No. 307,571. (No model.)

Claim.—1. The combination of the axle B, shaft D, rigidly seated thereon, body A, torsional springs E, box 5, and flexible link 7, substantially as shown, and for the purpose described.

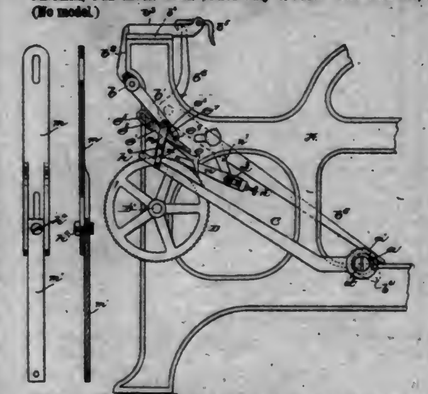
2. In a two-wheeled vehicle, the springs E, composed of three parts 1, 2, and 3, the part 2 being substantially perpendicular to the parts 1 and 3 and integral therewith, the parts 1 being rigidly attached to the bottom of the box A, the part 2 being journaled in the box 5, attached to the bottom of said box A, and the downward and outwardly extending part 3 furnished at its extremities with hook 6, adapted to be engaged and supported by link 7, suitably suspended from the shaft D or other suitable part of the frame, substantially as shown, and for the purpose described.

405,827. PROCESS OF TEMPERING TOOLS. GUSTUS A. BOTTOM, Austin, assignor of one-half to M. R. Campbell, Moreland, Ill. Filed July 30, 1888. Serial No. 281,471. (No model.)



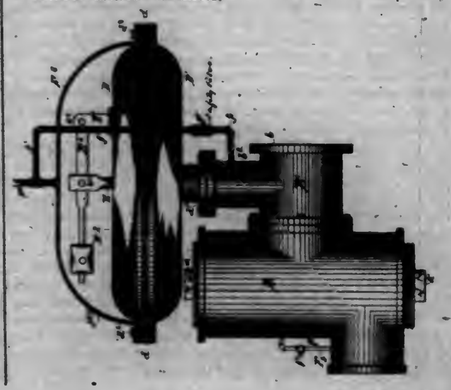
Claim.—The process of tempering tools, which consists in covering the working parts thereof, then heating and finally cooling the same while still covered, so as to prevent direct contact with cooling fluid, substantially as described.

405,828. CARPET-SWEEPER. EDWARD CARD, Pawtucket, R. I. Filed July 5, 1888. Serial No. 278,066. (No model.)



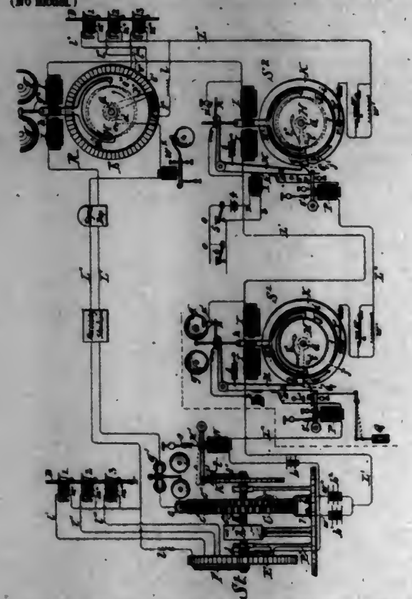
Claim.—The combination, with the dust-pan A and its handle B,

405,828.



of the brush E, provided with the loosely-connected handle G and with the arms F F and the pivoted links D D, which serve to connect the arms F F with the handle B for operation, substantially as described.

405,829. TAKE-UP MECHANISM FOR LOOMS. DANIEL CUSHMAN, Fall River, Mass. Filed July 3, 1887. Serial No. 243,736. (No model.)



Claim.—The ratchet-wheel, a pawl to move it, means to move the pawl, a detent consisting of the parts *e e'*, the part *e* being slotted and pivoted to the loom side, the two parts being adjustably connected by the screw e^3, a disengaging device for the pawl and detent, the two-part link *m m'*, adjustable by the screw A^4, to connect the pawl with the said disengaging device, the pawl and detent being moved simultaneously and automatically from engagement with the said ratchet-wheel, combined with a measuring-pawl, the said measuring-pawl being provided with an adjusting device n^4 to determine the extent of retrograde or backward movement of the ratchet-wheel, substantially as described.

405,830. AUTOMATIC CUT-OFF AND GAS-REGULATOR. CHAS. A. DAILY and HARRY K. RICHARDSON, Pittsburg, Pa. Filed Oct. 8, 1888. Serial No. 287,577. (No model.)

Claim.—In an automatic pressure-regulator and cut-off, the combination of the isolated high and low pressure chambers, a vertically-movable valve-stem operating in the low-pressure chamber and having the valves c c^2, adapted to open and close the ports between said chambers, an outlet-chamber communicating with the low-pressure chamber, a diaphragm-chamber communicating with the exit-chamber, a diaphragm, connections intermediate of the valve-rod and diaphragm, a hood F^2, fixed to the diaphragm-chamber, an escape-pipe F', leading from said hood, and a pipe f, communicating with the outlet-chamber and the escape-pipe and having an automatic valve F, substantially as described.

405,831. **ELECTRIC SIGNALING SYSTEM.** MARK W. DEWEY, Syracuse, N. Y., assignor, by direct and mesne assignments, to the Dewey Corporation, same place. Filed Mar. 15, 1889. Serial No. 303,401. (No model.)

Claim.—1. An electric signal-transmitting instrument composed of a rotatable shaft, a wheel mounted on said shaft and having circuit making and breaking points in its periphery, an electric contact bearing on said periphery, a stop-disk connected to the aforesaid shaft, and a detent adapted to engage and release said stop-disk, all in one and the same circuit, and a motor in another circuit rotating the aforesaid wheel and disk, as set forth.

2. In an electric signaling system, the combination of a plurality of transmitting-stations in circuit, each adapted to transmit a predetermined signal, one or more receiving-stations also in circuit, a suitable electric generator, a pulsator in said circuit therewith, a motor operating said pulsator, a motor at a receiving-station propelled by the pulsating currents in the circuit, an annulus of contacts, a trailing finger in another circuit rotated by the latter motor and traversing successively said contacts, a suitable annunciator at the receiving-station in circuit and having independent magnetic devices in branches of the circuit connected with the contacts on the annulus, a motor at the transmitting-station operated by the pulsating currents, and means at each of the transmitting-stations for sending an electric impulse at a predetermined moment operated by said motor.

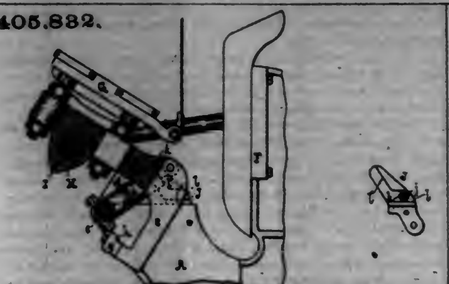
3. In an electric signaling system, the combination of a plurality of transmitting-stations and one or more receiving-stations in a line-circuit, a suitable source of electricity and pulsator therefor in said circuit, a motor operating said pulsator, a motor at the receiving-station operated by the pulsating current, an annulus of contacts at said station, a trailing finger in circuit rotated by the latter motor and traversing successively said contacts, a suitable annunciator at the receiving-station having independent electro-magnetic devices in branches of a circuit connected with the contacts on the said annulus, and a magnet in the latter circuit to operate the detent for releasing and stopping the said pulsator and controlled by the circuit makers and breakers at the transmitting-stations, and means at each of the transmitting-stations for transmitting an electric impulse at a predetermined moment to actuate the said annunciator.

4. In an electric signaling system, the combination of a plurality of transmitting-stations and a plurality of receiving-stations in a line-circuit, a suitable source of electricity, a pulsator therefor at a station in said circuit, a motor operating said pulsator, a motor at each of the receiving-stations actuated synchronously by the pulsating current, an annulus of insulated contacts at each of said stations, and trailing fingers in circuit traversing successively the said contacts and rotated by the motors thereat, a suitable annunciator at each receiving-station operated by electro-magnets in branches of a circuit connected with the contacts on the annulus, a magnet in the circuit to operate a detent for releasing and stopping the said pulsator and controlled at the respective transmitting-stations, and means at each of the latter stations for transmitting an electric impulse at a predetermined time during the movement of the trailing fingers to actuate a particular magnet of the annunciator.

5. An electric signaling system consisting of two line-circuits, a pulsator in the first of said circuits, a motor operating the pulsator, circuit-controlling wheels at the respective transmitting-stations in the second of said circuits, electric contacts in said second circuit bearing on the aforesaid wheels, an annulus of electric contacts at the receiving-station in the same circuit, a trailing finger also in said circuit traversing the annulus, an annunciator operated by magnets in branches of said circuit connected with the respective contacts of the annulus, motors at the respective transmitting-stations in the pulsator-circuit and operating the circuit-controlling wheels at said stations, a motor at the receiving-station in the pulsator-circuit and operating the trailing finger, and means for locking and unlocking the circuit-controlling wheels at the transmitting-stations.

6. In an electric signaling system, the combination of two line-circuits, a pulsator in the first of said circuits, a motor operating the pulsator, circuit-controlling wheels at the respective transmitting-stations and in the second of said circuits, electric contacts in the latter circuit bearing on said wheels, stop-disks rotating, respectively, with said wheels and in circuit therewith, detents adapted to engage and release the stop-disks, motors in the first circuit operating the aforesaid stop-disks and circuit-controlling wheels, shunts around said motors controlled by the aforesaid detents, an annulus of electric contacts at the receiving-station in the second circuit, a metallic trailing finger traversing the contacts of the annulus and in circuit therewith, an annunciator operated by magnets in branches of said circuit connected with the respective contacts of the annulus, and a motor in the first circuit operating the trailing finger, substantially as set forth.

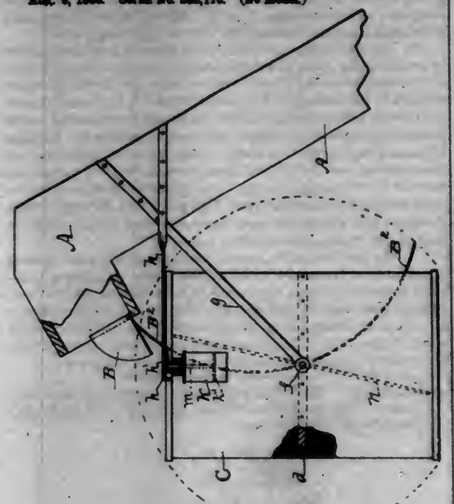
7. In an electric signaling system, the combination of two line-circuits, a pulsator in the first circuit, a motor operating said pulsator, circuit-controlling wheels at the respective transmitting-stations and in the second circuit, electric contacts in the latter circuit bearing on said wheels, stop-disks rotating, respectively, with said wheels and in circuit therewith, detents adapted to engage and release the stop-disks, motors in the first circuit at the transmitting-stations for operating the stop-disks and circuit-controlling wheels, levers adapted to lock the detents in their engagement with the stop-disks, springs drawing the levers into their locking positions, a stop-disk attached to the pulsator-shaft, a detent adapted to engage the latter stop-disk, a spring holding said detent out of engagement, and magnets in the second circuit, and when energized moving the latter detent and aforesaid levers in opposition to their respective springs, substantially as set forth and shown.



8. In combination with rotary circuit making and breaking wheel and stop-disk rotating therewith, and the detent adapted to engage and release said stop-disk, a lever adapted to lock the detent in its engagement, a spring holding the detent in its locking position, an electro-magnet in circuit adapted when energized to throw the lever out of its locking position, and a dash-pot connected with the lever to retard its action under the influence of the magnet, as set forth.

9. In combination with rotary stop-disk and circuit making and breaking wheel rotating with said disk and in one and the same circuit, a motor in another circuit operating said disk and wheel, and a detent adapted to engage and release the stop-disk and in circuit with the latter, an armature attached to the detent, an electro-magnet in a local electric circuit opposed to said armature, and operating-keys in said local circuit, as and for the purpose set forth.

405,832. **PRINTING-PRESS.** JOHN P. W. DORMAN, Baltimore, Md. Filed Oct. 20, 1887. Serial No. 253,696. (No model.)

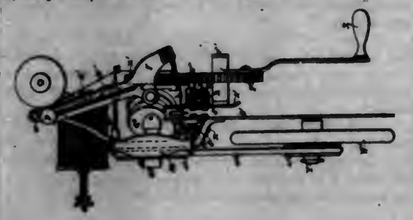


Claim.—1. In a printing-press, the frame thereof having lugs provided on their inner sides with grooves and inclined straight faces leading therefrom, as shown, combined with the bridge having rockers which rest on the said frame, and pins carrying rollers which rest in the said lugs, and, as the bridge carrying the platen is drawn toward the bed of the press, follow the said inclined straight faces to the said grooves, which they enter, and thereby bring the bridge and platen into a vertical position and hold them in said position while the impression is being made, substantially as and for the purpose specified.

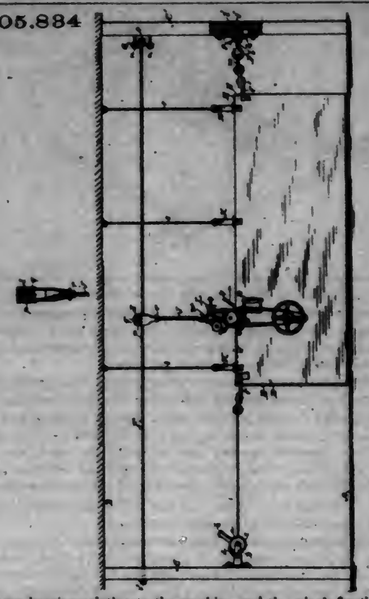
405,832.

2. The bridge H, having the extensions c, provided with the removable cap-pieces g, having the lips h, substantially as and for the purpose specified.

405,833. **GRAIN-METER.** LEE ELLIOTT, Stuart, Iowa. Filed Aug. 6, 1888. Serial No. 282,116. (No model.)



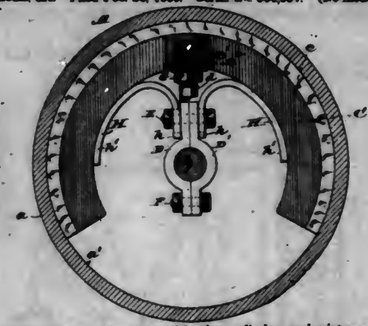
Claim.—1. The pockets K, fixed to the measure C, the movable bottoms k', having fixed rods m, extended through fixed guides m', and the springs m'', in combination with the fixed bar A and spring-latch k', substantially as shown and described, for the purposes stated.



2. The open-ended measure C, having a fixed partition or diaphragm d, a fixed shaft f, fixed pockets K, and fixed guides m', the rods m, having fixed bottoms k', the springs m'', the arms n and g, and the conveyer A, having a hinged chute B, provided with a curved arm B^2, arranged and combined to operate in the manner set forth, for the purposes stated.

405,834. **APPARATUS FOR SEWING INGRAIN CARPETS.** HENRY S. FLINT, Providence, R. I. Filed Mar. 9, 1887. Serial No. 230,300. (No model.)

Claim.—1. In combination, the elevated track, the pendulous support adapted for movement along the elevated track, the hand-operated carpet-sewing machine connected to the pendulous support and having an intermittent feed mechanism adapted to act upon the carpet, the pendulous clamps for supporting the edge of the carpet in



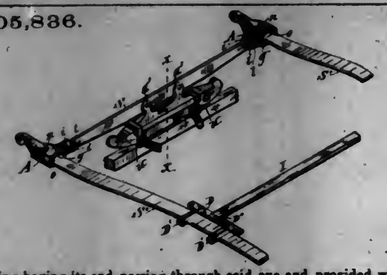
405,834

proper bearing relation to the machine, and the winch for tightening the juxtaposed edges of the carpet, substantially as described.

2. The combination of an elevated track, the depending support adapted to move along said track, the manually-operated carpet-sewing machine carried by the depending support and having feed mechanism adapted to act upon the carpet, the swinging clamps for supporting the edge of the carpet in suitable relation to the sewing-machine, and means for tightening the contiguous edges of the carpet, substantially as described.

405,835. **LUBRICATOR FOR CYLINDERS.** JAMES G. GRAGEY, St. Louis, Mo. Filed Feb. 20, 1888. Serial No. 300,567. (No model.)

Claim.—In combination with the cylinder and piston-rod, the herein-described lubricating device, consisting of the lubricator, the clamp; and the arms, said clamp having a threaded extension and nut, said arms being slotted, and said lubricator having a perforation to receive said extension, as set forth.



405,836. **SPRING-VEHICLE.** JOHN R. HADDEN and DAVID HARRY, Tyberg, N. Y. Filed Apr. 4, 1888. Serial No. 305,915. (No model.)

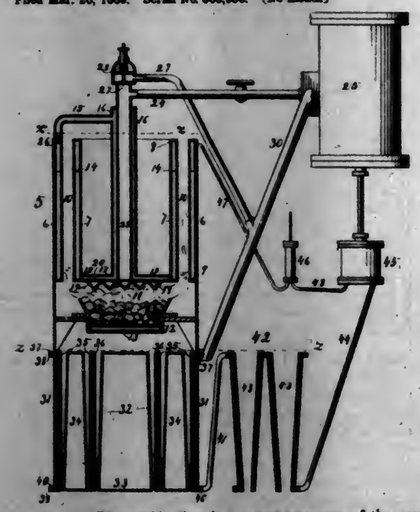
Claim.—1. The combination of the cross-spring, placed edgewise vertically and provided with eyes transversely through its ends, and the side springs having their ends passing through said eyes and secured therein, as set forth.

2. The combination of the cross-spring, placed edgewise vertically and provided with eyes transversely through its ends, the side springs having their ends passing through said eyes, shoes embracing the ends of said springs, and bolts or rivets passing vertically through the shoes and through the ends of the side springs protruding through the cross-spring, substantially as described and shown.

3. The combination of the cross-spring, placed edgewise vertically and formed with an eye transversely through its end, the side

405,836.

spring having its end passing through said eye and provided with a vertical perforation in the protruding end of the side spring, a shoe embracing the ends of the two springs, a bolt or rivet passing vertically through the shoe and aforesaid perforation of the side spring, and a shoulder on the side spring abutting against the receiving end of the shoe, substantially as described and shown.



4. In combination with the cross-spring, formed with an eye transversely through its end, and the side spring having its end passing through the said eye and provided with a vertical perforation in its protruding end, a shoe embracing said ends of the two springs and formed with laterally-projecting ears embracing the cross-spring, a bolt or rivet passing vertically through the shoe and aforesaid perforation of the side spring, and a bolt or rivet passing transversely through the aforesaid ears of the shoe and intervening portion of the cross-spring, substantially as described and shown.

5. The combination of the saddle *a*, formed with the horns *a' a'*, slotted in a direction lengthwise of the saddle and perforated transversely, and the cross-spring S, placed edgewise in the slots of the said horns and secured thereto by bolts or rivets passing through the perforations of the horns and through the spring, substantially as described and shown.

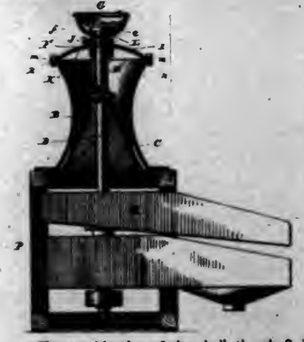
6. In combination with the head-block and the cross-spring, disposed edgewise vertically over the head-block, the saddle *a*, riding on the head-block and provided with the downward-projecting abutting lip *p*, and formed with the horns *a' a'*, slotted to receive the central portion of said cross-spring, and bolts or rivets passing through said horns and spring, substantially as described and shown.

7. In combination with the axle, head-block, and king-bolt having its fastening-nut on top of the head-block, the saddle *a*, rigidly secured to the head-block and provided with the square or polygonal socket *t* for holding the nut of the king-bolt, substantially as described and shown.

405,837. STEAM-GENERATOR. ALFRED HASBROUCK, Ithaca, N. Y. Filed Mar. 20, 1889. Serial No. 303,956. (No model.)

Claim.—1. The combination, in a steam-generator, of the annular vertical boiler 5, provided with the flues 10, the steam-pipes 15 and 16, and the check-valve 26 in the steam-pipe, the furnace 11, the superheater 19, located directly over the furnace, and the annular steam-compartment 17, located on the top of the superheater and communicating between the latter and the central pipe 23, substantially as shown and described.

2. The combination of an annular steam-boiler, a furnace located beneath its central opening, and a superheater located directly over the furnace and connected with the boiler by a pipe or pipes, and provided with a discharge-pipe, substantially as shown and described.



3. The combination of a vertical annular steam-boiler provided with flues passing through its annular portion, a furnace located beneath its central opening and communicating remotely with the said flues, a superheater located directly over the said furnace and beneath the said central opening of the boiler, a vertical pipe passing centrally down the said opening, and a steam-pipe between the boiler and the said vertical pipe, a check-valve in the last-named pipe, and another vertical pipe passing from the center of the superheater through the first-named vertical pipe, and a steam-pipe adapted to connect the latter vertical pipe with an engine, substantially as shown and described.

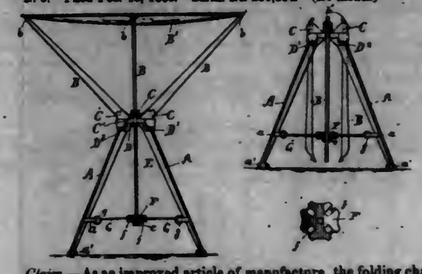
4. The combination of a vertical steam-boiler, a furnace below it, a steam-condenser directly below the furnace and provided with passages for air through it to the furnace, a steam-pipe between the boiler and the superheater, a steam-pipe adapted to lead from the superheater to an engine-cylinder, a safety-valve in the last-named conductor, and a steam-pipe from the outlet of the said safety-valve to the said condenser, substantially as shown and described.

5. The combination of a vertical steam-boiler, a furnace beneath it, a superheater directly over the furnace, an engine-cylinder, steam-conductors between the boiler and superheater, and between the superheater and the steam-ports of the said cylinder, a condenser beneath the furnace having openings or flues through which the draft to the furnace is admitted, an exhaust-pump and a force-pump, and pipes connecting the exhaust-ports of the cylinder and the condenser between the condenser and the exhaust-pump, between the two pumps, and between the force-pump and the boiler, whereby suction may be exerted on the exhaust-ports of the cylinder through the intermediate condenser, and whereby the water condensed from the exhaust-steam may be continually returned to the boiler.

6. The combination, in a steam-generator, of a furnace, a series of coils of pipe located one within another above the furnace, a partition across each pipe, a series of apertures communicating between adjacent pipes near the said partition, whereby a continuous passage for steam is obtained from the circumference to the center of the series of pipes, and an inlet near the circumference thereof and an outlet near the center, substantially as shown and described.

405,838. CORN-SHELLER. CHARLES L. HEISLER, Dunkirk, N. Y., assignor of one-half to Edward Nichols, same place. Filed Jan. 21, 1889. Serial No. 297,027. (No model.)

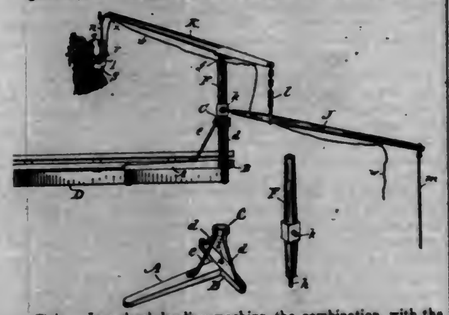
Claim.—1. The combination of the shell, the shaft in two sections, and the cone turning with and sliding on the lower section and adjustable vertically with the upper section, substantially as set forth.



2. The combination, with the shell and the cone, of the shaft in two sections, the upper section suspending the cone, and a stationary adjustable bearing for the upper section of the shaft in which it turns, substantially as set forth.

3. The combination of the shell, the shaft in two sections, the cone turning with and sliding on the lower section and adjustable with the upper section, the yoke K, and an adjusting-screw for the upper section of the shaft mounted in the said yoke, substantially as set forth.

4. The combination, with the cone and the shell, of the shaft in two sections, the upper section E being headed and supporting the cone, the stationary adjustable bearing provided with a sleeve in which the section E of the shaft turns, and above the upper face of which the head of the said section bears, substantially as set forth.

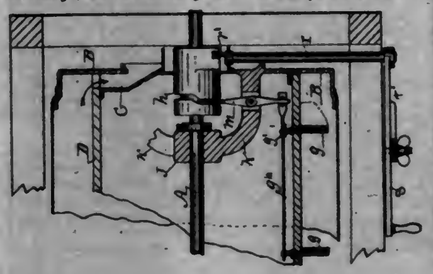


5. The combination of the driving-shaft, the shelling-cone mounted thereon and provided with a socket or aperture at its upper end, the walls of which socket or aperture are cut, a shaft fitting into the said socket or aperture, and a clamping-bolt for securing the shaft in the socket or aperture, substantially as set forth.

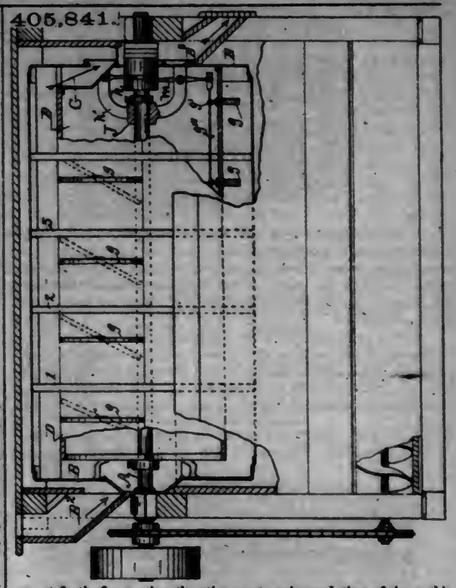
405,839. FOLDING CHAIR. KELLOGG T. HUELBERT, Lakewood, N. J. Filed Feb. 13, 1888. Serial No. 299,804. (No model.)

Claim.—As an improved article of manufacture, the folding chair herein described, consisting of the octagonal central plate C', whose upper face has four slotted blocks C, provided with cross-bars *c c' c²*, and from whose lower surface project four blocks D' in different vertical directions from the blocks C, provided with perforations D^2, the legs A, whose upper ends abut in said plate C', the rods G, maintaining the legs in position, the rods E, wherefrom said rods radiate, the annulus F, whereto said rods are attached, the rods B, whose lower termini abut in the blocks C, and the seat B', the whole co-operating as herein shown and described.

405,840. SHOCK-LOADING MACHINE. WILLIAM J. JACOBS, Bargersville, Ind. Filed Feb. 4, 1889. Serial No. 298,662. (No model.)



Claim.—In a shock-loading machine, the combination, with the mast and the lifting-levers mounted thereon, of the trip-hook consisting of the bar suspended from the free end of the lifting-lever, the disk pivoted to the bar and having notches *t* and *u*, the pawl pivoted to the bar and arranged to engage one of said notches, and the trip-cord attached to said pawl, all arranged to co-operate substantially as and for the purpose specified.

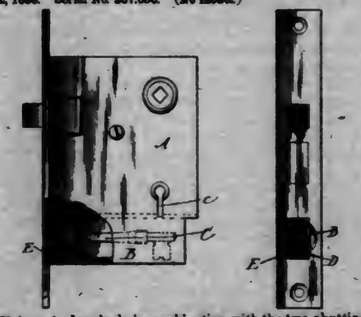


405,841. ADJUSTABLE AUTOMATIC CONVEYER AND BOLTING-REEL. GEORGE I. JARRETT, Des Moines, Iowa. Filed Oct. 30, 1888. Serial No. 289,530. (No model.)

Claim.—1. The stirrers *g*, having arms on the ends of their shafts, in combination with the cylinder D and reciprocating rods *g''*, for the purpose stated.

2. The combination of the grooved cam *h*, the shaft A, the levers *m*, the rods *g''*, and the stirrers *g*, and a reel to operate in the manner set forth, for the purposes stated.

405,841.



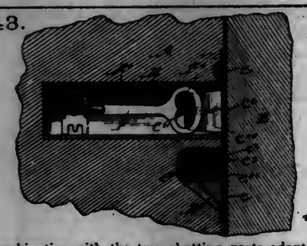
ner set forth, for moving the stirrers at each revolution of the reel in the manner set forth, for the purposes stated.

3. The shaft *r*, having a crank-pin *r'*, in combination with the grooved cam *h*, for the purpose of operating the cam on the shaft A in the manner set forth, for the purposes stated.

4. A reel having integral open-ended pockets on one of its ends, a cylinder fixed in the reel and provided with series of pivoted deflectors *g* on its surface, arms on the ends of the deflector-shafts, and reciprocating rods connected with said arms and with a cam-wheel on the reel-shaft, arranged and combined with a case to operate in the manner set forth, for the purposes stated

405,842. LOCK. THOMAS R. JEFFERY, Ravenswood, Ill. Filed Mar. 12, 1888. Serial No. 267,050. (No model.)

Claim.—1. In a lock, in combination with the two abutting parts, which are secured together by it, the lock-case having a key-receptacle formed within it, such receptacle having its entrance at the plane of the abutting edges of the locked parts, substantially as set forth.

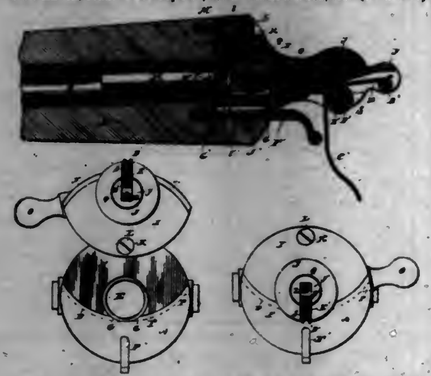


2 In combination with the case containing a key-receptacle, a spring located in such receptacle and operating upon the key to retain it therein, substantially as set forth.

405,843. KEY-RECEPTACLE. THOMAS R. JEFFERY, Ravenswood, Ill. Filed Nov. 23, 1888. Serial No. 292,084. (No model.)

Claim.—1. In combination with the two abutting parts adapted to be locked together, a key-receptacle in one of said parts having its entrance at the plane of their abutting edges, and a cover adapted to close said entrance, substantially as set forth.

2. In combination with the two abutting parts adapted to be locked together, a key-receptacle in one of said parts having its entrance at the plane of their abutting edges, and a spring-actuated cover pivoted to such part and adapted to close said entrance, substantially as set forth.



405,843.

3. In combination with the two abutting parts adapted to be locked together, a key-receptacle in one of said parts having its entrance at the plane of their abutting edges, and a key-withdrawing device jointed to the abutting part which contains said receptacle, and entering said receptacle and adapted to engage the key, substantially as set forth.

4. In a key-receptacle, in combination with a face-plate having an opening which serves as the entrance to said receptacle, a lever pivoted to the face-plate and adapted to close said opening, and having a projection adapted to engage the key and enter the opening when the lever is rocked toward the plate, substantially as set forth.

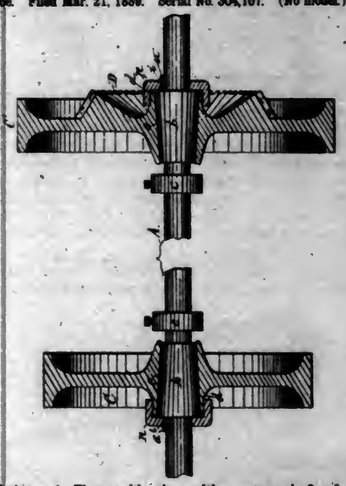
405,844. BREECH-LOADING ORDNANCE. JOSEPH P. LAVIGNE, New Haven, Conn. Filed Sept. 10, 1888. Serial No. 285,020. (No model.)

Claim.—1. A cannon having a transverse mortise in its breech, and a breech-piece combining a breech-block and a breech-knob and pivoted in such mortise on a pivot located in the vertical line through the axis of the bore of the gun, whereby the said breech-piece is virtually balanced in the mortise, substantially as set forth.

2. A cannon having in its breech a transverse mortise provided with a low outer wall and with a curved floor extending at its lowest point just below the bore of the gun and rising at its ends, and a breech-piece combining the breech-piece and breech-knob and pivoted in such mortise in the vertical line through the axis of the bore of the gun, the block having its lower edge cut away to form a wide shoulder adapted to fit between such low wall and the inner wall of the mortise, substantially as set forth.

3. A cannon having in its breech a transverse mortise provided with a low outer wall and with a curved floor extending at its lowest point just below the bore of the gun and rising at its ends, and a breech-piece combining the breech-block and breech-knob and pivoted in such mortise in the vertical line through the axis of the bore of the gun, the block having its lower edge cut away to form a wide shoulder to fit between such low wall and the inner wall of the mortise, and the adjacent faces of the said low wall and the shoulder being undercut to form a dovetail joint, substantially as set forth.

4. A cannon having a breech-block and a breech-knob and a firing-hammer combined with such block and knob and adapted to be operated directly in its effective stroke, substantially as set forth.



5. A cannon having a breech-block and a breech-knob, a firing-hammer mounted in such block and knob so as to move endwise therein, a lanyard attached to the rear end of the hammer and passed over a point of purchase located in front of the point of its attachment to the hammer, and a rebounding spring located in front of the hammer, the lanyard constituting the sole means of giving the hammer its effective stroke, substantially as set forth.

6. A cannon having a breech-piece combining a breech-block and a breech-knob provided with a longitudinal chamber, and with a slot located in the central lower edge of the knob and intersecting such chamber, a firing-hammer located in such chamber and having its lower face slotted, an anti-friction roll located in the slot in the knob and extending upward into the slot in the hammer, and a lanyard secured to the rear end of the hammer and passing forward over the said roll, substantially as set forth.

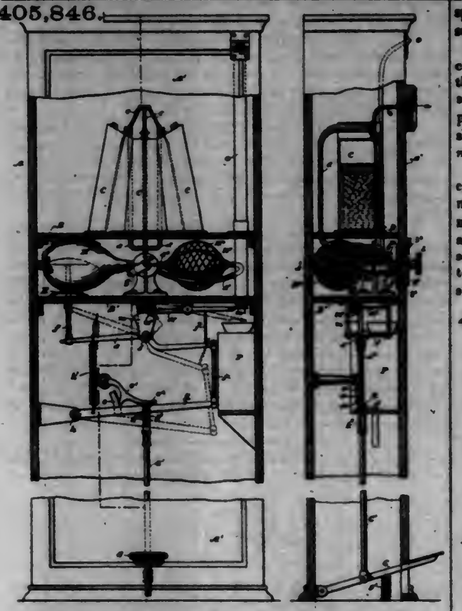
7. A cannon having a breech-knob, a firing-hammer having a slot, the forward end whereof forms a stop, and a movable stop mounted in the knob and extending into the slot in the hammer for coupling the same with the knob, substantially as set forth.

8. A cannon having a slotted breech-knob, a firing-hammer having a slot, the forward end whereof is curved to form a stop, an anti-friction roll mounted in the slot in the knob on a removable pin and extending up into the slot of the hammer, which it holds in place by the engagement of the said stop thereof with it, substantially as set forth.

405,845. AUTOMATIC SAFETY-CLUTCH. GEORGE LE CLAIR, Oswego, N. Y., assignor to the Le Clair Manufacturing Company, same place. Filed Mar. 21, 1888. Serial No. 304,107. (No model.)

Claim.—1. The combination, with a rotary shaft, of a conical bearing rigidly secured to said shaft, a wheel mounted movably longitudinally on said bearing and provided with screw-threads on the exterior of the hub over the large end of the conical bearing, and a binding-nut sliding longitudinally on the shaft and confined circumferentially thereon and adapted to engage and release the aforesaid screw-threaded hub, the screw-threads running from the wheel in opposite direction from the rotation of said wheel, substantially as and for the purpose shown and set forth.

2. The combination, with the shaft A, of the rigid conical bearing *b*, spline *a* at one end of said bearing, collar *c*, near the opposite end thereof, the wheel C, provided with the conical eye *e* and with the screw-threaded hub portion *d*, and the nut *n*, sliding on the shaft and provided with the slot *i* and adapted to engage and release the aforesaid screw-threaded hub, substantially as described and shown, for the purpose set forth.



405,846. APPARATUS FOR DISPENSING LIQUIDS. JOSEPH C. MATERNOFER, New York, N. Y., assignor, by direct and mesne assignments, to the American Automatic Spray Perfume Company, of New York. Filed Oct. 23, 1888. Serial No. 288,910. (No model.)

Claim.—1. The vending apparatus comprising the receptacles C, atomizer-tips *c*, tubes *d*, connected to the tips and to the casing D, the air-compressor E, flexible reservoir E', the hollow cock D', having openings *e*, to which the reservoir is connected, the levers J K, the treadle G, and a locking counterbalanced pawl N for locking the levers, and the tube O to receive the coin, substantially as described.

2. The vending apparatus comprising the chute O, to receive a coin or token, in combination with the locking counterbalanced pawl N, lever J, provided with the locking-segment, the air-compressor, the cock, the tubes *d*, and the receptacles C and atomizer-tips, and means for operating the lever J, substantially as described.

3. The vending apparatus comprising the lever J, having a locking-segment, the lever K, and the treadle and connecting-rod G G', in combination with the counterbalanced pawl N, plate H', and bulb E, one or more liquid receptacles, atomizer-tips attached thereto, and tubes connecting the atomizer-tips with the bulb E, substantially as described.

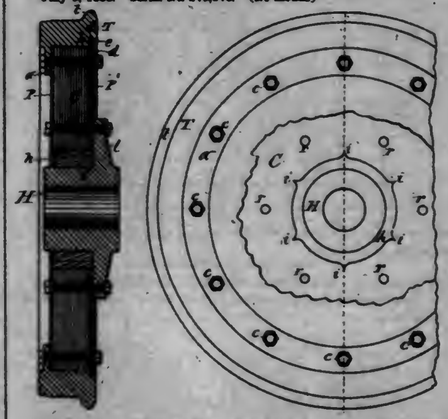
405,846.

4. In a vending apparatus, the combination of a lever J, having a locking-segment and a pawl-stop, a counterbalanced pawl, a coin-plate attached to the pawl, and a coin-tube, substantially as shown and described.

5. In an apparatus for vending liquids, in combination with a liquid-receptacle, an atomizer-tip connected with the receptacle, and an air-compressor connected with the atomizer-tip, a device for operating the air-compressor, consisting of a plate bearing against the air-compressor, a pivoted lever having one end connected with the plate in any suitable way, a dog to engage with the lever, a treadle, a treadle-rod having a sliding connection with the lever, and a spring to raise the treadle, whereby the treadle-rod, after sliding upon the lever, will disengage the dog from the lever and permit the lever to return to its initial position, substantially as shown and described.

6. In an apparatus for vending liquids, in combination with a liquid-receptacle, an atomizer-tip connected with the receptacle, and an air-compressor connected with the atomizer-tip, a device for operating the air-compressor, consisting of a plate bearing against the air-compressor, a rod attached to said plate, a pivoted lever connected at one end with the rod and provided with a notched segment and a pawl-stop, a counterbalanced pawl to engage with the notched segment and lock the lever, a plate on the end of the pawl, a coin-tube, a second pivoted lever attached by suitable means to the other end of the first lever, a dog to engage with the second lever, a treadle, a treadle-rod having a sliding connection with the second lever, and a spring to raise the treadle, whereby the treadle-rod, after sliding upon the second lever, will disengage the dog from that lever and permit the lever to return to its initial position, substantially as shown and described.

7. In an apparatus for vending liquids, in combination with a liquid-receptacle, an atomizer-tip connected with the receptacle, and an air-compressor connected with the atomizer-tip, a device for operating the air-compressor, consisting of a plate bearing against the air-compressor, a rod attached to said plate, a pivoted lever connected at one end with the rod, a treadle connected with the other end of the pivoted lever, a shoulder on the pivoted lever, a counterbalanced pawl engaging with said shoulder, a pawl-stop on the lever, a coin-tube, and a plate below the end of the coin-tube and connected with the pawl, onto which the coin drops, thereby raising the pawl and unlocking the pivoted lever, substantially as shown and described.



8. In an apparatus for vending liquids, in connection with an air-compressor, a device for operating the air-compressor, consisting of the plate H, the rod *j'*, the pivoted lever J, provided with the notched segment *m*, the rod *j*^{3}, the lever K, the treadle G, the rod G', connecting the treadle and the lever K, and the spring *g'*, substantially as shown and described.

9. The lever K, having segment *o*, in combination with the pawl *o'*, having projection *o*^{3}, and the connecting-rod G', treadle G, and spring *g'*, the connecting-rod being attached to the lever K by slot *k*^{3}, substantially as described.

10. In a device for vending liquids, in combination with an air-compressor, a device for operating the air-compressor, consisting of the plate H, the rod *j'*, the pivoted lever J, provided with the notched segment *m*, the rod *j*^{3}, the lever K, the spring *k'*, the segment *o*, the pawl *o'*, having projection *o*^{3}, the pin *k*^{3}, the rod G', provided with the slot *k*^{3}, the treadle G, the spring *g'*, the pawl N, the pawl-stop *j*^{3}, plate *m*^{3}, and the coin-tube O, substantially as shown and described.

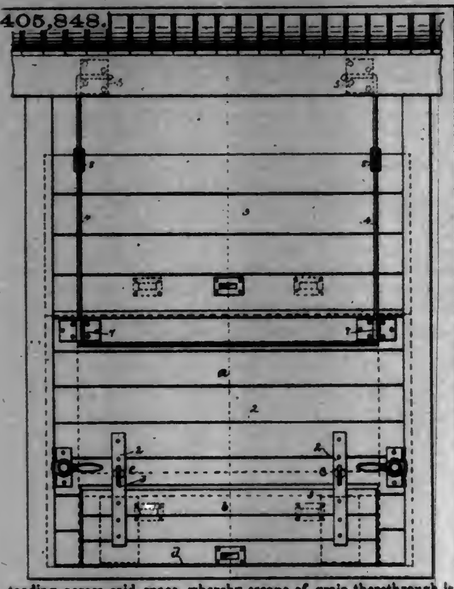
11. A vending apparatus comprising receptacles C, atomizer-tips *c*, tubes *d*, casing D, hollow cock D', having apertures *e*, knob *b*, connected with the cock, disk *b*^{3}, pointer *b*^{4}, reservoir E', tubes *d'* and *d*^{3}, netting E^3, air compressor E, connected with the reservoir-plates H and H', rod *j'*, lever J, notched segment *m*, rod *j*^{3}, lever K, spring *k'*, segment *o*, pawl *o'*, having projection *o*^{3}, pin *k*^{3}, rod G', having slot *k*^{3}, treadle G, spring *g'*, pawl N, pawl-stop *j*^{3}, plate *m*^{3}, and coin-tube O, substantially as shown and described.

405,847. CAR-WHEEL. EDGAR PECKHAM, New York, N. Y. Filed July 9, 1888. Serial No. 278,378. (No model.)

Claim.—1. In combination with the hub and the non-metallic core C, the bushing *h*, formed on its outer peripheral face with projections embedded in the sides of the aperture of the core, and the web-plate P', provided with a central eye of the same shape and diameter as the exterior of the bushing and receiving the end of the latter through it, substantially as described and shown.

2. The combination, with the tire formed at one side of its inner peripheral face with the inward-projecting flange *a*, and provided at the opposite side with the circumferential groove *b*, of the wheel-body composed of the non-metallic core C and web-plates P P', all extending to the periphery of said body and seated on the tire at the inner side of the aforesaid flange, the retaining-ring *d*, applied to the plate P', and formed with the flange *d'*, entering the groove *b*, and bolts or rivets *e*, uniting said parts, substantially as described and shown.

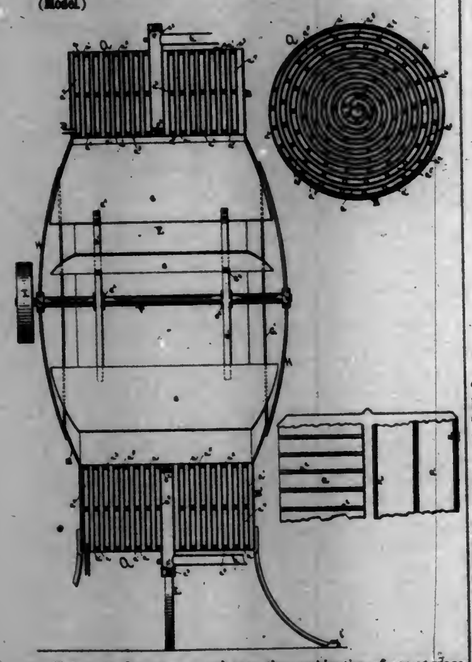
3. The combination, with the tire formed at one side of its inner peripheral face with the flange *a*, and provided at the opposite side with the rabbet *c* and groove *b* in said rabbet, the wheel-body composed of the core C, and web-plates P P' at opposite sides of said core, and all extending to the periphery of the body and seated on the tire, with the face of the plate P' flush with the rabbet *c*, the retaining-ring *d*, applied to the latter plate and projecting into the said rabbet and formed with the flange *d'*, entering the groove *b*, and bolts or rivets *e*, uniting said parts, substantially as described and shown.



405,848. FREIGHT-CAR DOOR. JOSEPH S. PORTER, Sandusky, Ohio, assignor of two-thirds to Frank G. Scofield and John L. Moore, same place. Filed Dec. 10, 1888. Serial No. 293,114. (No model.)

Claim.—1. A car-door having an opening in its lower portion and an outwardly-swinging auxiliary door hinged thereto, said auxiliary door having an independent vertical movement, as set forth.

2. A car-door having an opening in its lower portion and an outwardly-swinging auxiliary door hinged thereto, said auxiliary door having an independent vertical movement, combined with a fixed stop for the lower edge of the auxiliary door, as set forth.



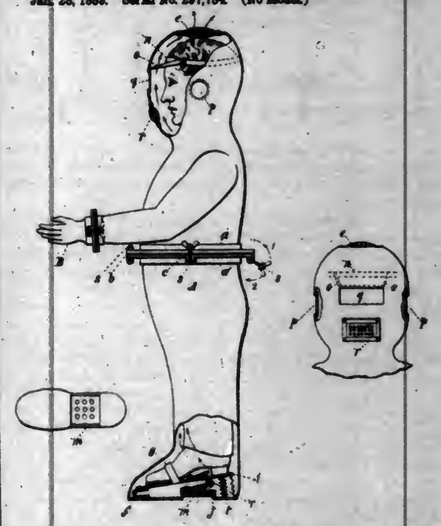
3. A car-door having an opening in its lower portion, an auxiliary door hinged, as described, thereto and fitted in said opening, but made narrower than the height thereof, whereby, when the auxiliary door is in place, a space is formed between its upper edge and the upper edge of said opening, said space permitting a limited independent upward movement of the auxiliary door, and a cleat or strip ex-

405,848.

teading across said space, whereby escape of grain therethrough is prevented, as set forth.

405,849. CONDENSER FOR EXHAUST-STEAM. BENTLEY L. RINEHART, Camden, N. J. Filed Jan. 16, 1889. Serial No. 296,548. (Model.)

Claim.—1. In a steam-condenser, the combination of one or more coiled steam-passages connected with a steam-supply pipe, provided with a water-outlet and encircled by transverse cold-air flues receiving air from a suitable fan, as and for the purpose set forth.



2. In a steam-condenser, the combination of two stripe of sheet metal in concentric coils and secured at their inner ends to a steam-supply pipe, having in the alternate spaces between their convolutions transverse and longitudinal partitions forming cold-air flues and steam-passages, the latter being provided with a water-outlet with a suitable fan, as and for the purpose set forth.

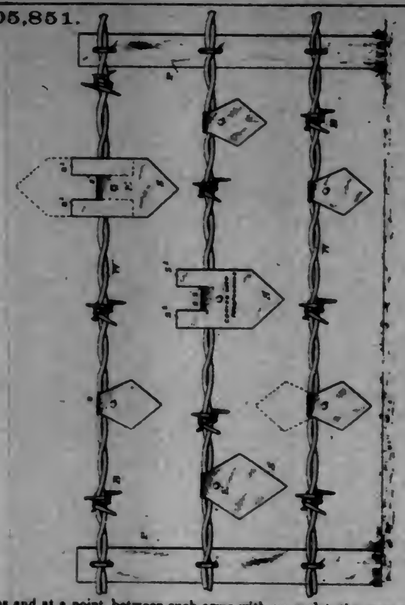
3. In a steam-condenser, the combination of two or more steam-coils encircled by transverse cold-air flues and provided with steam-inlets and water-outlets, the casings of said coils being secured to the casing of a single rotary fan, said fan supplying cold air to the flues of all the coils, as and for the purpose set forth.

4. In a steam-condenser, the combination of coils A A', composed of stripe *a a'*, and having the longitudinal and transverse steam and air spaces a^3 and a^2, formed by the wire sections a^4 and a^5, all contained within the casings B B', said steam-spaces being connected with steam-supply pipe C, valves c' and c^2, and provided with water-outlet D, as set forth.

5. In a steam-condenser, the combination, with coils A A' composed of stripe *a a'*, having longitudinal and transverse steam and air spaces a^3 a^2, formed by wire sections a^4 a^5, said steam-spaces being provided with steam-inlet pipe C, valves c' c^2, and water-outlet D, of a fan G supported on a shaft F, and having the arms e' on collars e^2 encircling said shaft, said arms having offsets e^3, in which rest the blades *e*, and screws e^4 for securing said blades thereto, shaft F being journaled in bosses *h* on spider-legs H, secured to casing G by screws *g*, and provided with pulley I, receiving motion through belt *i*, fan-casing G, having openings G', coils A and A' being connected to arms *k* of the exhaust-pipe K, and casing A' being provided with legs L, secured thereto by screws *l*, as and for the purpose set forth.

405,850. ASEPTIC SUIT. JARROT L. ROLLINS, Greenfield, Ill. Filed Jan. 28, 1889. Serial No. 297,734. (No model.)

Claim.—1. An aseptic suit or dress consisting, chiefly, of rubber or other air-proof material adapted to entirely cover the wearer and provided with germ-proof inlets and outlets for atmospheric air, all constructed and adapted to operate substantially as and for the purpose set forth.



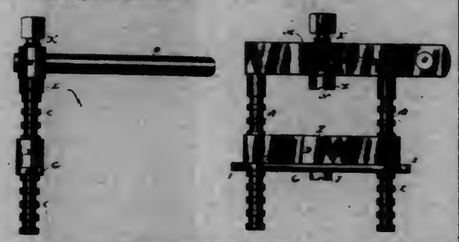
2. The combination, with an aseptic suit or dress consisting, chiefly, of air-proof material adapted to entirely cover the wearer and provided with germ-proof inlets and outlets for atmospheric air, of bellows adapted to be actuated by the feet of the wearer for the purpose of supplying the interior of the dress or suit with a current of filtered air drawn through the germ-proof inlet in the foot part thereof, and to expel it as it becomes vitiated through the germ-proof disks in the crown and in front of the head part of the dress, all constructed and adapted to operate substantially as and for the purpose set forth.

3. The combination, with an aseptic suit or dress adapted to entirely cover the wearer, of germ-proof disks located in close proximity to the ears and adapted to admit the use of the stethoscope, said disks being constructed substantially as and for the purpose set forth.

405,851. FENCE-SIGNAL. JOHN SCHLYER, Hays City, Kans. Filed May 1, 1888. Serial No. 272,515. (No model.)

Claim.—As an article of manufacture, a fence-signal formed of a single strip provided at its upper corners with upwardly-projecting

405,851.

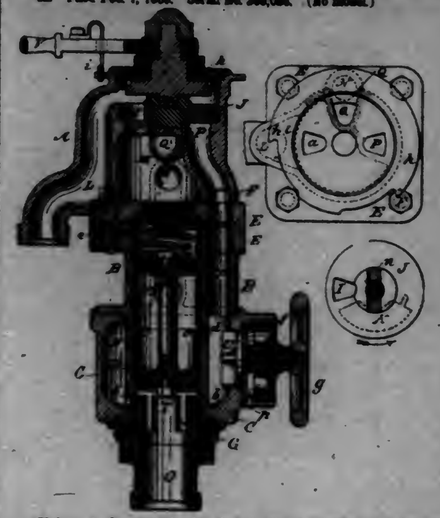


arms and at a point between such arms with an eyelet, the arms extending a short distance above the wire, as set forth.

405,852. PROCESS OF REFINING COTTON-SEED OIL. GEORGE W. SCOLLAY, New York, N. Y. Filed Jan. 12, 1889. Serial No. 296,170. (No specimens.)

Claim.—In the manufacture of refined cotton-seed and other analogous oils, the process, substantially as described, of treating crude oil with suitable alkali—such as caustic-soda lye or caustic-potassa lye—until the grosser impurities are removed and the oil only partially brought to the condition of yellow oil of commerce, and of subsequently treating said partially-refined oil with ocher or fuller's-earth to complete the refining.

405,853. LATHE-DOG. THOMAS C. SMITH, Bridgeport, assignor to Reuben H. Brown & Co., New Haven, Conn. Filed Apr. 7, 1888. Serial No. 269,914. (No model.)



Claim.—1. A lathe dog having two parallel arms, each provided with corresponding retaining-points, a cross-bar adapted to slide freely over such arms, and a locking-button carried by the said cross-bar and adapted to engage with the arms to lock the said bar thereto, substantially as set forth.

2. A lathe-dog having two parallel arms, each provided with corresponding retaining-points, a bar adapted to slide freely over such arms, a locking-button carried by such bar and adapted to engage with the arms to lock the said cross-bar thereto, and a clamping-screw mounted in the main frame-piece of the tool and midway between the two arms, substantially as set forth.

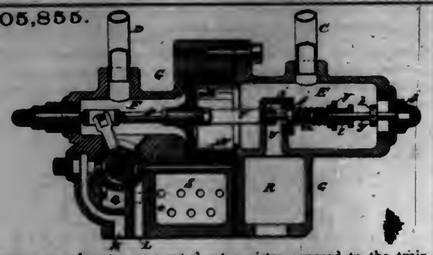
3. A lathe-dog having two parallel arms, each having its surface divided into corresponding retaining-points formed by alternate spaces and collars, a bar adapted to slide freely upon such arms, and a locking-button carried by the said bar and adapted to be engaged with the arms to lock the bar thereto, substantially as set forth.

4. A lathe-dog having two parallel arms, each provided with corresponding retaining-points, a cross-bar adapted to slide freely over such arms, and a locking-button pivoted to the said bar and having its opposite ends slotted from their opposite edges to adapt it to engage with the arms for locking the bar thereto, substantially as set forth.

405,854. AIR-BRAKE OPERATING AND REDUCING VALVE. REINALDO SOLARI, Brooklyn, N. Y., assignor of three-fourths to John W. Howard and David R. Morse, same place, and Lucius G. Fisher, Chicago, Ill. Filed Feb. 7, 1889. Serial No. 299,088. (No model.)

Claim.—1. In an air-brake, the combination, with a supply-pipe, a train-pipe, and an operating-valve intercepting the same, of a double-piston pressure-reducing valve, ports communicating between the operating-valve and train-pipe through the piston-valve cylinder at points intermediate to the pistons, whereby such communication is controlled by the reciprocative movement of the pistons, the one exterior surface of the pistons receiving pressure from the train-pipe and the opposite exterior surface thereof being free from pressure, and a resisting-spring for opposing the movement of the pistons caused by the train-pipe pressure, so as to normally maintain the opening of the said ports communicating between the operating-valve and the train-pipe.

2. In an air-brake, the combination, with the charging and exhaust ports of an operating-valve, of a reducing-valve-containing cylinder, the intermediate portion whereof communicates with the said charging-port, an annular chamber terminal to the said exhaust-port surrounding a portion of the cylinder and permanently communicating through ports adjacent the end of the same with the train-pipe to which said end connects, double pistons embracing the portion of the interior of the cylinder communicating with the charging-port, and ports extending from such portion into the said annular chamber, being subject to control by the reciprocative movements of one of said pistons over them, and a resisting-spring acting upon the pistons in opposition to the pressure received thereon from the train-pipe, as specified.



3. In an air-brake, the combination, with a main reservoir, a train-pipe, and an engineer's operating-valve controlling the admission of fluid at will from said reservoir to said train-pipe, of a pressure-reducing valve, arranged between the engineer's valve and the train-pipe, automatically controlling the pressure of the fluid admitted by said operating-valve to the train-pipe, substantially as described.

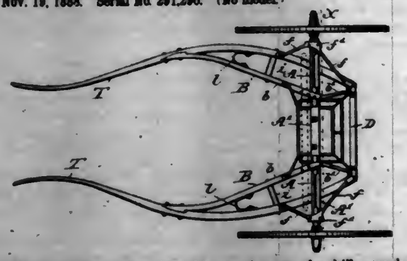
405,855. AUTOMATIC AIR-BRAKE. REINALDO SOLARI, Brooklyn, N. Y., assignor of three-fourths to John W. Howard and David R. Morse, same place, and Lucius G. Fisher, Chicago, Ill. Filed Feb. 7, 1889. Serial No. 299,089. (No model.)

Claim.—1. In an air-brake, the combination of a double-acting brake-cylinder, a brake-cylinder valve for connecting opposite sides of the brake-cylinder alternately with pressure or exhaust, a connected valve-piston or its equivalent permanently exposed to the train-pipe and auxiliary-reservoir pressures on opposite sides thereof, an expanding chamber connective by means of the said brake-cylinder valve with the releasing side of the brake-cylinder, and a normally-closed relief-valve controlling communication between the expanding chamber and the train-pipe, said relief-valve being opened by the valve-piston when communication between the expanding chamber and the brake-cylinder is closed, for the purposes set forth.

2. The combination, with a double-acting brake-cylinder, of a valve capable of connecting opposite sides of the brake-cylinder with

405,855.

pressure or exhaust, a connected valve-piston exposed to the train-pipe and auxiliary-reservoir pressures on opposite sides thereof, an expanding chamber connective with the releasing side of the brake-cylinder through said valve, a puppet-valve operative in line with the valve-piston to open toward the train-pipe pressure and control communication of the expanding chamber therewith, a shouldered stem provided to said puppet-valve, and a yoke upon the valve-piston that engages with said shouldered stem to trip the puppet-valve to an open position when the brake-cylinder valve is moved to a position to disconnect the expanding chamber with the brake-cylinder.



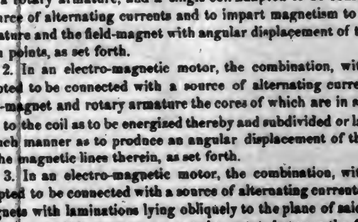
3. The combination, with the brake-cylinder valve capable of closing all the cylinder-ports at a mid-position, the connected piston or its equivalent, the puppet relief-valve in line therewith, the retarding-spring upon the stem thereof adapted to retard the return movement of the valve-piston at mid-stroke, as described, and a piston-yoke straddling the puppet-valve seat and traversing the spring-bearing stem to afford an abutment of the piston upon said spring, and the shouldered sliding collar, as *l*, whereby the spring and valve-stem shoulder are kept in proper relation with one another and with the said yoke.

4. In an air-brake, the combination of a brake-cylinder, valve controlling the passage of air to and from the cylinder, a valve-operating piston or its equivalent movable between two chambers, one E in communication with the train-pipe and the other F with the reservoir, an expanding chamber communicating with the chamber E through a port closed by a relief-valve, and connections between the relief-valve and valve-piston arranged to open the relief-valve when the communication between the expanding chamber and brake-cylinder is closed, substantially as set forth.

5. The combination, with the valve controlling the flow of air between the brake-cylinder, reservoir, and external air, and a valve controlling the flow of exhaust-air from the train-pipe to a receiving-chamber, of a single valve-operating piston connected to operate both valves, substantially as set forth.

6. The combination, with the relief-valve and its operating-piston, of a spring bearing on the valve and a bearing V, carried with the piston and having a limited movement between the end of the spring and a stop *k* on the valve-rod, substantially as and for the purpose set forth.

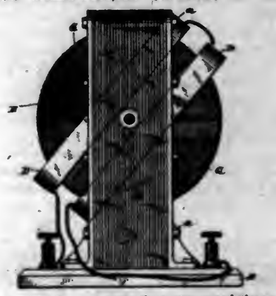
405,856. SULKY. STEPHEN P. SOUTHARD, Geneva, N. Y., assignor to C. C. Post, same place, and Hannah Southard, Waterloo, N. Y. Filed Nov. 19, 1888. Serial No. 291,290. (No model.)



Claim.—1. In combination with an axle-truss, the thills attached directly thereto and extending rearward therefrom, a cross-bar uniting the rear ends of the thills, braces attached to the axle-truss and having their front ends extending from each other and along the inner sides of the thills and secured with their front ends to the thills and at the rear ends with the aforesaid cross-bar, and stirrups secured to the inner sides of the thills and outer sides of the aforesaid braces, substantially as described and shown.

2. In combination with the axle-truss, the thills mounted thereon and extending rearward therefrom, the cross-bar D, uniting the rear ends of the thills, and the braces B B, each composed of the wooden rail *b*, secured at its front end to the inner side of one of the thills and abutting with its rear end against the axle-truss, and the metallic extension *b'*, secured to the axle-truss and having its front end lapping onto and rigidly attached to the aforesaid wooden rail, and the rear end of said metallic extension secured to the cross-bar D, substantially as described and shown.

3. In combination with the axle-truss, the thills mounted thereon and extending rearward therefrom, the cross-bar D, uniting the rear ends of the thills, the metallic axle A, provided with the mortise *a*, and the brace B, having the metallic extension *b'*, provided with the mortise *c* and seated with the mortised portion in the mortise *a* and firmly secured to the axle-truss, substantially as set forth and shown.



405,857. SPRING-VEHICLE. JOSEPH H. TALMADGE, Cortland, N. Y. Filed Dec. 13, 1888. Serial No. 293,501. (No model.)

Claim.—1. In combination with the two running-gears and side bars D D, the plates *a a*, fastened to the under side of the side bars between the front and rear running-gears and formed with the inner projections *a' a'*, the side springs C C, secured at their central portions to the aforesaid projections and having their end portions vibratory vertically, and the body B, carried between the springs and by the end portions thereof, substantially as described and shown.

2. In combination with the front and rear running-gears and side bars D D, the side springs C C, supported at their central portions on said side bars and having their front end portions deflected downward and forward and the rear ends curved upward and forward, and the body carried on the ends of said springs, substantially as described and shown.

405,858. ELECTRO-MAGNETIC MOTOR. NIKOLA TESLA, New York, N. Y., assignor to the Tesla Electric Company, same place. Filed Jan. 8, 1889. Serial No. 296,745. (No model.)

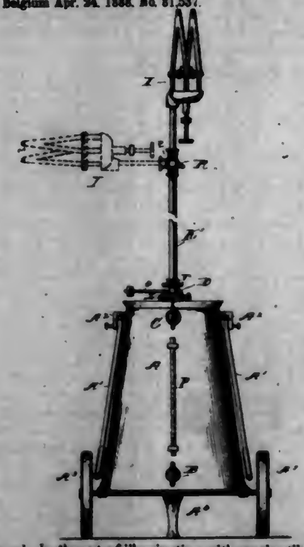
Claim.—1. An electro-magnetic motor consisting of a field-magnet, a rotary armature, and a single coil adapted to be connected to a source of alternating currents and to impart magnetism to both the armature and the field-magnet with angular displacement of the maximum points, as set forth.

2. In an electro-magnetic motor, the combination, with a coil adapted to be connected with a source of alternating currents, of a field-magnet and rotary armature the cores of which are in such relation to the coil as to be energized thereby and subdivided or laminated in such manner as to produce an angular displacement of their poles or the magnetic lines therein, as set forth.

3. In an electro-magnetic motor, the combination, with a coil adapted to be connected with a source of alternating currents, of field-magnets with laminations lying obliquely to the plane of said coil and a circular or disk armature mounted to rotate between the field-magnets, both field and armature being under the magnetizing influence of the coil, as set forth.

4. In an electro-magnetic motor, the combination, with a coil adapted to be connected with a source of alternating currents, of field-magnets with laminations lying obliquely to the plane of the coil and a circular or disk armature with spiral or concentric laminations mounted between the field-magnets, both field and armature being under the magnetizing influence of the coil, as set forth.

5. In an electro-magnetic motor, the combination, with a coil adapted to be connected to a source of alternating currents, of a field-magnet and a rotary armature with closed coils thereon, both the field and the armature being under the magnetizing influence of said coil and laminated to produce an angular displacement of the poles of the two cores.

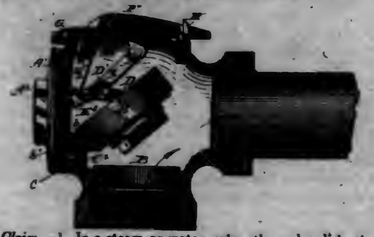


405,859. METHOD OF ELECTRICAL POWER TRANSMISSION. NIKOLA TESLA, New York, N. Y., assignor to the Tesla Electric Company, same place. Filed Mar. 14, 1888. Serial No. 302,251. (No model.)

Claim.—1. The method of operating synchronizing motors herein described, which consists in electrically connecting intermediate points of the inducing-circuit of the generator and the energizing-circuit of the motor until the motor has reached a desired speed and then interrupting such connection, as set forth.

2. The method herein described of starting or operating synchronizing motors, which consists in electrically connecting intermediate points of the inducing-circuit of the generator and the energizing-circuit of the motor to earth until the motor has reached the desired speed and then interrupting either or both of the ground-connections, as set forth.

405,860. APPARATUS FOR SUPPLYING COMBUSTIBLE LIQUIDS TO BURNERS. ROUSDEDGE WALLWORK and ARTHUR C. WELLS, Manchester, County of Lancaster, England. Filed Sept. 14, 1888. Serial No. 285,381. (No model.) Patented in England Mar. 8, 1887, No. 3,543, and in Belgium Apr. 24, 1888, No. 81,537.

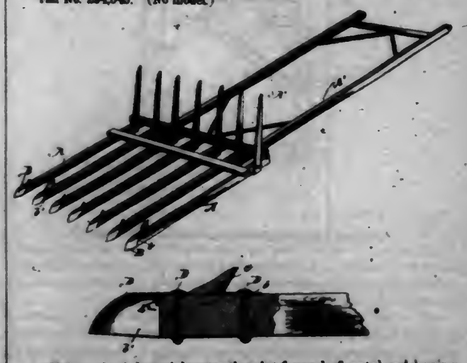


Claim.—1. In the art of illuminating with combustible liquids, a portable reservoir, a fluid-delivery pipe having its inlet near the bottom of said reservoir, a burner or burners connected with the supply-pipe, and a force-pump having its suction or inlet open to the atmosphere and its discharge in proximity to the bottom of the reservoir, said parts constituting a portable illuminating apparatus, substantially as described.

2. In the art of illuminating with combustible liquids, a reservoir mounted on wheels, a fluid-delivery pipe having its inlet near the bottom of said reservoir, a burner or burners connected with the supply-pipe, and a force-pump having its suction or inlet open to the atmosphere and its discharge in proximity to the bottom of the reservoir, said parts constituting a portable illuminating apparatus, substantially as described.

3. In the art of illuminating with combustible liquids, a portable reservoir, a fluid-supply pipe having its inlet near the bottom of the reservoir, a burner or burners connected with said pipe, a pressure-regulating valve interposed in the supply-pipe between the burner and reservoir, and a pressure-indicator for said reservoir, in combination with a force-pump having its suction-port open to the atmosphere and its discharge-port in proximity to the bottom of the reservoir, said parts constituting a portable illuminating apparatus, substantially as described.

405,861. RADIATOR-VALVE. WILLIAM E. WOOD, Utica, N. Y. Filed Feb. 2, 1889. Serial No. 298,441. (No model.)



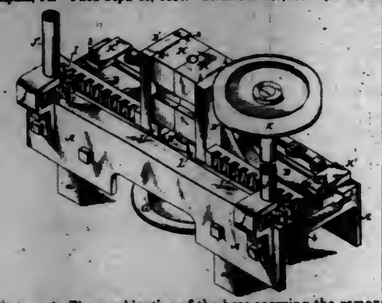
Claim.—1. In a steam or water valve, the valve-disk, the operating toggle-lever connected therewith, a rocking arm or foot-piece connected with the toggle-lever for forcing the valve open, a spring to act on the foot-piece to force the valve to its seat, and means for automatically engaging said rocking arm or foot-piece to hold the valve open to its full capacity, substantially as described.

2. In a steam or water valve, the combination of the valve-disk, the rocking arm or foot-piece, the toggle-levers connected to the valve, and the rocking arm or lever connected to the toggle-lever through a link-connection, substantially as described.

3. In a steam or water valve, the combination of the valve-disk, a toggle-lever connected to the valve-disk and to the casing to operate within the valve-body, and a spring for acting on the toggle-lever located outside the body or casing, substantially as described.

4. In a steam and water valve, the combination of the valve-disk, a toggle-lever connected to the valve-disk, a rock-shaft having a rocking arm connected thereto within the valve-body, a link connecting the rocking arm with the toggle-lever, and a spring located outside the valve-body to act on the rock-shaft to force the valve-disk to its seat, substantially as described.

405,862. METAL POINT FOR THE TEETH OF HAY-RICKERS, &c. HORACE A. ALDEN and JOHN R. KIRK, Peoria, Ill., assignors to the Acme Hay Harvester Company, same place. Filed Dec. 24, 1888. Serial No. 294,545. (No model.)

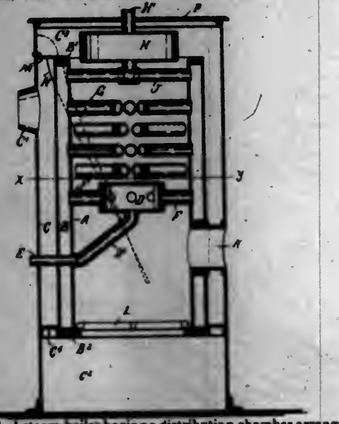


Claim.—1. A hay-ricker-tooth point formed of metal and having its forward end inclined and beveled, and having projecting above its upper face and at a distance from its forward end an inclined nook or extension C, substantially as described.

2. The combination, with a tooth having a blunt end, of a metal point rigidly affixed thereto and having a socket the interior of which is provided with a suitable stop or rib for the end of the tooth, and having one side extending backward, whereby the point may be bolted to the tooth, substantially as described.

3. A tooth-point having its rear portion formed with suitable sides *b* and *b'* and with one side open, and having a socket to receive the squared end of the tooth, the interior of said socket being provided with a suitable stop or rib against which the end of the tooth will abut, substantially as described.

405,868. MOLD FOR GLASSWARE. RICHARD M. ATWATER and EMIL HERCHNER, Millville, N. J., assignors to Whitall, Tatum & Co., Philadelphia, Pa. Filed Sept. 10, 1887. Serial No. 249,344. (No model.)



Claim.—1. The combination of the base carrying the removable lower die with sliding frames carrying removable side dies, said frames being movable from and toward each other in a straight line, substantially as described.

2. The combination of the base and two frames adapted to slide thereon with racks on each frame, and shafts J', carrying pinions controlling the racks and having a handle within convenient reach of the attendant, substantially as specified.

3. The combination of the sliding frames having die-supporting brackets L secured thereto, with dies H, resting upon said brackets, and securing devices by which the dies are attached to the sliding frames, substantially as described.

4. The combination of the sliding frames carrying dies, each frame being provided with pins *k*, with adjustable stops K' on the base, against which the pins strike when the dies are at the limit of their inward movement, substantially as set forth.

405,864. STEAM-BOILER. MIFFLIN W. BAILY, Pottstown, Pa. Filed Mar. 11, 1889. Serial No. 302,909. (No model.)

Claim.—1. A steam-boiler having a distributing-chamber arranged above the fire-box, said chamber being connected by tubes with the water-space of the boiler and also with a water-supply tube passing through said water-space, substantially as set forth.

2. A cylindrical steam-boiler having a distributing-chamber arranged above the fire-box, said chamber being connected by tubes with the water-space of the boiler and having a water-supply tube extending below said chamber and connecting with an inlet-tube passing through the annular water-space of the boiler, substantially as set forth.

3. A cylindrical steam-boiler having a distributing-chamber arranged above the fire-box, said chamber being connected by tubes with the water-space of the boiler and having a water-supply tube extending below the chamber and connected with said water-space, the lower end of said supply-tube inclosing the end of a tube secured to the outer shell of the boiler and passing through said water-space, substantially as set forth.

4. The combination, with a cylindrical steam-boiler having an interior fire-box, of a casing forming an annular smoke-circulating chamber surrounding the outer boiler-shell and communicating with the fire-box, said chamber being provided with a smoke-outlet, a check-plate above said outlet, and partitions extending from said check-plate toward the lower end of the chamber, all arranged substantially as and for the purpose set forth.

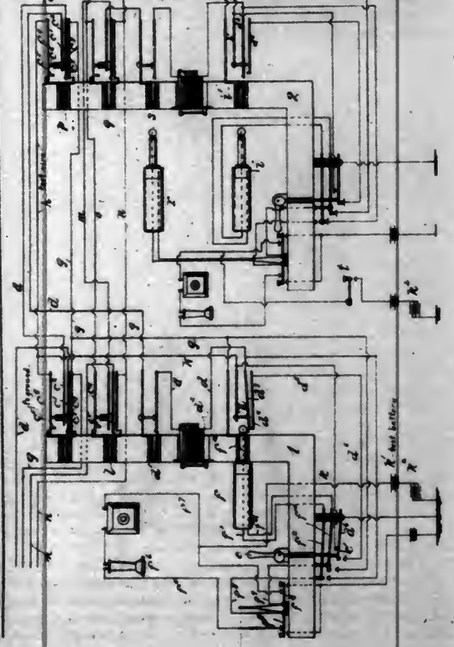
5. A cylindrical boiler having an interior fire-box, an annular water-space, an annular smoke-circulating chamber, a water-distributing chamber connected with said water-space and also with a supply-tube passing through said water-space and smoke-chamber, and water-tubes and steam-drum arranged above said distributing-chamber, all substantially as set forth.

405,865. ARTIFICIAL FUEL. ISIDORE C. BANDMAN, Atlanta, Ga. Filed Aug. 30, 1888. Serial No. 284,191. (No specimens.)

Claim.—As a new article of manufacture, a hardened cake of fuel composed of a core or interior of one or more large lumps of coal and a surrounding igniting composition consisting, essentially, of a mixture of rosin, sawdust, pine-needles, and powdered coal, the pine-needles and rosin firmly uniting the composition surrounding the coal and preventing the cake from crumbling and breaking, the surrounding composition first igniting and generating sufficient heat to ignite the lump coal.

405,866. FLUX-CARRIER. JAMES C. BAYLES, East Orange, N. J. Filed May 22, 1889. Serial No. 311,689. (No model.)

a [redacted]



Claim.—1. The combination of the welding-flux with a fibrous material adapted to hold the flux in the joint to be united, substantially as herein set forth.

2. The combination, with the welding-flux, of fine wire net, as and for the purpose set forth.

3. Iron wire-gauze coated with melted borax, as and for the purpose set forth.

4. A continuous ribbon of iron wire-gauze coated with fluxing material, as and for the purpose set forth.

405,867. TELEPHONE-EXCHANGE APPARATUS. FRANKLIN G. BEACH, Chicago, Ill. Filed Dec. 3, 1887. Serial No. 257,309. (No model.)

Claim.—1. A spring-jack switch consisting in the combination, with the tube, of two springs, which are interchangeably connected and disconnected therefrom upon the insertion and withdrawal of the plug, and the line-terminal spring and its normal contact, substantially as described.

2. The combination, with the tube or test-piece of a spring-jack switch, of the line-spring resting upon its contact and two springs on opposite sides of said line-spring, and insulating material on opposite sides of said line-spring, separating said line-spring from said other springs, respectively, and a loop-plug, which, on being inserted, separates the line-spring from its normal contact, at the same time permitting one of the two outer springs to fall away from its connection with the tube while the other outer spring is closed thereto, substantially as described.

3. The combination, with the tube *a'*, of the insulated springs c', c^2, and c^4, the contact-point c^3, against which spring c' normally rests, the loose pin between springs c' and c^4, the ground-connection c^5 for spring c^4, the spring c^2 being insulated from spring c' and adjusted to move therewith, and a plug which on being inserted separates spring c' from its normal contact and permits spring c^4 to separate from the tube and close upon its ground-contact c^5, while at the same time spring c^2 is forced into connection with said tube.

4. A strip of spring-jacks, each consisting of a socket with which two different springs are alternately connected and disconnected on the insertion of a plug, the portion of the strip containing said sockets being removable, substantially as described.

5. The socket *a'*, provided with contact-points a^3 and a^4, said contacts being extended to inclose springs on opposite sides of a spring-jack, in combination with said springs, and means for alternately connecting and disconnecting said springs from said contacts.

6. A spring-jack switch provided with a line-terminal, the normal contact of said line-terminal, a test-spring insulated from said line-terminal, and a connection for the return portion of a circuit, in combination with the loop-plug inserted in said switch, whereby the line-spring is separated from its normal contact and closed to the tip of the plug, while at the same time the return-connection of the switch is closed to the sleeve of the plug.

7. A ground spring-jack switch consisting of the lever d^3, permanently insulated from the connection *k'* of said switch, a ground-connection d^4, and the insulated socket or frame, in combination with a loop-plug, which on being inserted separates ground-connection d^4 from connection *k'* and closes connection d^3 to said ground-connection d^4 while connection is made between the tip of the plug and spring d^3, and at the same time the sleeve of the loop-plug connected with the socket, substantially as described.

8. The loop-plug *f* and its terminals connected with springs f^3 f^{10}, respectively, said springs including in their circuit a telephone and a branch ground-connection *k*, including a test-battery, substantially as described.

9. Two metallic-circuit telephone-lines, each connected through different spring-jack switches on two or more multiple switch-boards and each provided with a loop-plug terminal and test-circuits, one for each line, each of said test-circuits being normally open, in combination with independent ground-connections for each of said test-circuits, with which ground-connections said test-circuits are closed automatically on the insertion of the loop-plug terminal of one line into a spring-jack switch of the other line.

10. A telephone-line connected through the line-terminal and contact of two or more switches on different switch-boards and thence through an annunciator, and thence normally through a grounding-switch to ground, in combination with a return-wire connected with a spring of each of the spring-jack switches of said line, and with the grounding-switch, an independent test-wire for said line connected with another spring of each of the spring-jack switches of the line and with a contact of the grounding-switch, and direct ground-connections, one for the test-wire spring of each of the spring-jack switches and one for the grounding-switch, whereby a signal may be sent over the line to throw down the annunciator and a test-circuit provided, the circuit of which is provided with a direct ground-connection when the telephone-line is connected with another line.

11. The combination, with two telephone-lines connected together, of separate local test-wires, one for each of said lines, said telephone-lines being each connected with spring-jack switches on different multiple switch-boards, and the test-wires being connected with each of the spring-jack switches of their lines, respectively, and a direct ground-connection c^5 for each of the spring-jack switches, whereby each of said test-wires is provided with a different direct ground-connection independent of any portion of said telephone-lines when the two lines are connected, substantially as described.

12. In a multiple-switch-board system, a test-wire normally connected with a test-piece of each of the switches of a telephone-line, in combination with a special direct ground-contact on each of the spring-jack switches, whereby on making connection with said line at either switch said test-wire is disconnected from said test-piece and closed to the special direct ground-contact of the spring-jack switch at which the connection is made.

13. In a multiple-switch-board system of telephone-exchange, two telephone-line circuits provided with spring-jack switches, a separate spring-jack switch being provided for each line on each board, in combination with the test-circuits, a separate test-circuit being provided for each telephone-line, the test-circuit of each line being connected with a special test piece or spring of each of the switches of its line and a direct ground-connection near each special test-connection, said direct ground-connections being independent of any portion of the telephone-lines, and plugs at the different switch-boards, whereby on inserting a plug in any switch the special test-connection of the switch will be closed directly to ground without closing or connecting the test-wire with the main-circuit line.

405,868. TOY. ALFRED L. BERNARDIN, Evansville, Ind. Filed Feb. 15, 1889. Serial No. 300,082. (No model.)

Claim.—The toy consisting of the tubular whistle having its deflecting-piece at the air-outlet, the yoke having the pivot-bearings and reflected ends, and the bladed wheel circumferentially tangent to the barrel of the whistle and pivoted in the yoke, substantially as specified.

405,869. DUST-COLLECTOR. EUGENE BARTHEL, Indianapolis, Ind., assignor to the Cookie Separator Manufacturing Company, Milwaukee, Wis. Filed May 21, 1888. Serial No. 274,463. (No model.)

Claim.—1. In a dust-collector, the combination of the casing provided with an inlet, a dust-discharge opening, and an air-outlet, and formed with its interior contracted in size in the direction of said dust-discharge opening, and a deflector adjustable toward and from the discharge-opening, arranged within said casing below said inlet and above said dust-discharge opening, substantially as set forth.

2. The combination, in a dust-collector, of the cone-shaped casing B, the tubular guard C, and the vertically-adjustable deflector D, arranged below the air-inlet of said casing and above its dust-discharge opening, substantially as set forth.

405,870. STOCK-CAR. JOHN M. BURTON and CHARLES C. CREWSON, Wichita, Kans. Filed Oct. 29, 1888. Serial No. 289,457. (No model.)

Claim.—1. The combination, in a stock-car provided with the side posts P and the sheathing N, extending down at the car sides a distance from the top and forming the outer wall of the hay-receptacle, and the slats G, secured to the inner sides of said posts, extending up a distance from the car-floor, and forming the lower portion of the side walls of the car, of the troughs C, pivotally secured to the inner sides of said posts above said slatting G by means of their connected bearings, adapting them to turn between said posts, the folding racks R, hinged to said posts at their lower part and forming the inner wall of said hay-receptacle, the side sections B, having the arms *a a'*, hinged to the side of said posts at the base of said sheathing, wherein arms *a* are arranged, extending into the car adjacent said

racks, the links L, connecting the lower portion of sections B with troughs C, and the mechanism consisting of rods J J', crank-arms $z' z''$, shaft S, and lever z, connected with arms a of said side sections through the medium of said rods, whereby the said side sections and troughs can be turned and the racks unfolded into position for use, substantially as specified.

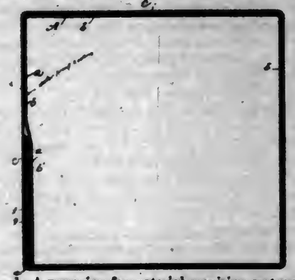
2. The combination, in a stock-car provided with the side posts P and the sheathing N, secured to the outer upper part of said posts and forming the outer wall of the hay-receptacle, and the slats G, secured to the lower inner portion of said posts and forming the lower portion of the side walls of the car, of the troughs C, pivotally secured to the inner side of said posts above said slatting by means of their connected bearings adapting them to turn between said posts, sections B, having arms $a a'$, hinged to the side of said posts at the base of said sheathing, which arms a are arranged extending into the car within said sheathing, the links L, connecting the lower portion of said sections B with said troughs, and the mechanism consisting of rods J J', cranks $z' z''$, shaft S, and lever z, connected with arms a of said sections through the medium of said rods, whereby the said side sections and troughs can be turned into or out of position for use, substantially as set forth.

3. The combination, in the stock-car described, provided with the side posts P and the sheathing N, secured to the outer upper part of said posts and forming the outer wall of the hay-receptacle, of the racks R, hinged to the upper inner part of said posts at their lower portion and forming the inner wall of the hay-receptacle, the side wall-sections B, having arms a, hinged to the side of said posts at the base of the hay-receptacle and extending upward into the said receptacle adjacent said racks, and the mechanism consisting of the rods J J', cranks $z' z''$, shaft S, and lever z, connected with arms a of said sections through the medium of said rods, whereby the said sections are turned and the said racks are unfolded into position for use, substantially as specified.

4. The combination, in the stock-car described, provided with the side posts P and the sheathing N, secured to the outer upper part of said posts and forming the outer wall of the hay-receptacle, of the folding racks R, hinged at their lower portion to the inner upper part of said posts and forming the inner wall of the hay-receptacle, the spring-arms F, or their equivalent, arranged to bear against said racks to yieldingly hold them folded, the side wall-sections B, having the arms a, hinged to the side of said posts at the base of said hay-receptacle and extending upward into said receptacle adjacent said racks, and the mechanism consisting of the rods J J', cranks $z' z''$, shaft S, and lever z, connecting said arms a by means of said rods, whereby the said wall-sections are turned and the racks unfolded into position for use and the racks automatically folded when hay in the receptacle is consumed or removed, substantially as specified.

5. The combination, in a stock-car provided with hay-receptacles in the upper part of its side walls, of the racks R, hinged at their lower part and forming the inner wall of said receptacle, the spring-arms F, or their equivalent, arranged to bear against said racks to yieldingly hold them folded, and the mechanism consisting of arms a of the side wall-sections B, shaft S, boxed longitudinally in the upper part of the car, lever z, and cranks $z' z''$, secured on said shaft, and rods J J', connecting said cranks with said arms, whereby said arms are operated to unfold said racks into position for use, substantially as specified.

6. The combination, in a stock-car provided with the side posts P and the sheathing N, secured to the outer upper part of said posts and forming the outer wall of the hay-receptacle, of the folding racks R, hinged at their lower part to the inner upper part of said posts and forming the inner wall of the hay-receptacle, the side wall-sections B, having the arms a, hinged to said posts at the base of said receptacle and extending into said receptacle adjacent said racks, the canvas ends or folds e, arranged to protect said arms from contact with hay in the receptacle, and the mechanism consisting of shaft S, cranks $z' z''$, and lever z, secured thereon, and rods J J', connecting said cranks with said arms, whereby the said sections and arms are turned and said racks unfolded into position for use, substantially as specified.



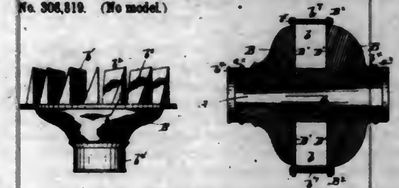
7. The combination, in a stock-car provided with the side posts P, of the troughs C, arranged between and pivotally secured to the inner side of said posts by means of their connected bearings g, the side wall-sections B, having arms a, hinged to the side of said posts and extending into the car, links L, connecting the lower portion of said sections with said troughs, and the shaft S, longitudinally arranged in the upper part of the car, the lever z, secured on said shaft and arranged extending through a slot in the car-roof, catches $v v'$, for holding said lever, the cranks $z' z''$, secured on said shaft, and the rods J J', connecting said cranks with said arms a, whereby the said side-wall sections and troughs are turned into or out of position for use by means of said lever from the car-roof, substantially as specified.

8. The combination, in a stock-car, of the pivoted side sections B, having arms $a a'$, rods B', connecting-rods J J', crank-arms $z' z''$, shaft S, and lever z, substantially as and for the purpose set forth.

9. The combination, in a stock-car, of the pivoted side sections B, having arms $a a'$, rods B', pivoting said sections, links L, pivoted watering-troughs C, folding hay-racks R, connecting-rods J J', crank-arms $z' z''$, shaft S, and lever z, substantially as and for the purpose set forth.

10. The combination, in a stock-car, of the pivoted side sections B, having arms $a a'$, rods B', pivoting said sections, watering-troughs C, pivotally arranged below said sections, links L, for connecting said sections and troughs, connecting-rods J J', crank-arms $z' z''$, shaft S, and lever z, and catches for holding said lever, substantially as and for the purpose specified.

405,871. WATER-PROOF PACKAGE. MELVIN R. CHASE, Grand Rapids, Mich. Filed Dec. 31, 1887. Serial No. 259,456. (No model.)

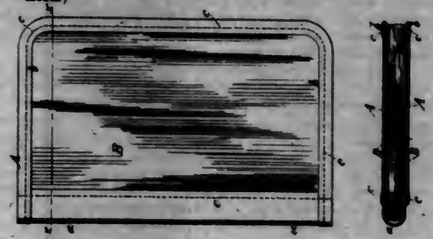


Claim.—1. A wrapping for material requiring water-proof packing, consisting of an inner wrapper having a water-proof interior, a non-drying adhesive and water-proof material between its folds to hold them together, an outer non-water-proof wrapper inclosing the inner, one lap of said outer package being secured to the inner package, and the other or over lap being pasted over the first or under lap, the ends of said inner and outer package being folded down and secured by adhesive material, substantially as described.

2. A wrapping for material requiring water-proof packing, consisting of an inner wrapper having a water-proof interior, a non-drying adhesive and water-proof material between its folds, an outer non-water-proof wrapper inclosing the inner, one lap of said outer package being secured to the inner package at its joint and covering the same, and the other or over lap being pasted over the first or under lap, substantially as described.

3. A wrapping for material requiring to be packed water-proof, consisting of an inner wrapper having a waterproofed surface, a non-drying adhesive material between its folds, and an outer non-water-proofed wrapper having its folds secured by ordinary paste, substantially as described.

405,872. HUB FOR VEHICLE-WHEELS. EDWARD D. CLARK and SIMMON C. CLARK, Evergreen, Tex. Filed Apr. 27, 1889. Serial No. 308,819. (No model.)



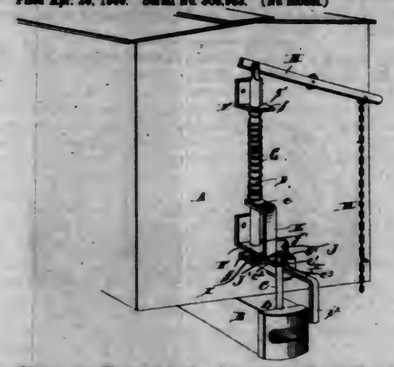
Claim.—A hub consisting of a cylindrical box having a central collar or enlargement and enlongated depressions in the ends, the body portions having the wedge-shaped lugs upon their faces, and the extended flanges for receiving the holding bolts and the screws in the diminished ends thereof, as set forth.

405,873. ICE-CREEPER. FREDERICK W. COE, Vergennes, Vt. Filed Mar. 20, 1889. Serial No. 304,000. (No model.)

Claim.—The ice-creeper consisting of the heel-plate having the rear clamp-lugs and the corrugated middle channel, the slotted adjustable serrated bar, its fastening-screw, and the cam-lever catch connected to the front end of said bar, substantially as specified.

405,874. CELLULOID OR ANALOGOUS BINDING. KATE J. COLLIER, New York, N. Y. Filed May 12, 1888. Serial No. 273,696. (No model.)

Claim.—1. The combination of a sheet of celluloid, a sheet of leather or like material, and a sewed seam uniting the two sheets, substantially as herein set forth.



2. The combination, with a sheet of celluloid, of layers of leather or like material placed on opposite sides of its edges, and a sewed seam passing through both of said layers and the celluloid between them, substantially as and for the purpose herein set forth.

3. The combination of a sheet of paper with the sheet of celluloid, the layers of leather or like material placed on opposite sides of the edge of the celluloid sheet, and a sewed seam passing through said layers, paper, and celluloid sheet, substantially as and for the purpose herein set forth.

4. The combination, with the back B of a book or volume, of sheets of celluloid, layers of leather or like material placed on opposite sides of the edges of said celluloid sheets and connected with the back B, and a sewed seam passing through both of the said layers and the celluloid between them, substantially as and for the purpose herein set forth.

5. The combination, with the back B, of sheets of celluloid, layers of leather or like material placed on opposite sides of the edges of said celluloid sheets, paper placed upon the inner surfaces of said celluloid sheets and extended under the adjacent layer of leather or like material, and sewed seams passing through said layers, paper, and celluloid sheet, substantially as and for the purpose herein set forth.

405,875. CAR-COUPLING. WILEY G. COLLIER, Shamrock, Va. Filed Apr. 20, 1889. Serial No. 308,263. (No model.)

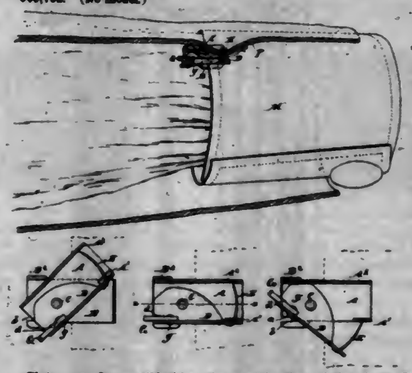
Claim.—1. The combination, in a car-coupling, with a draw-head, of a coupling-pin, a rod sliding in suitable brackets and provided with an arm connected to said pin, and a spring to hold the rod normally depressed, substantially as specified.

2. The combination, in a car-coupling, with a draw-head, of a coupling-pin, the rod pivoted with an arm extending forward and downward and connected to said pin, the brackets provided with aligned openings in which said rod works, and a spring interposed between said arm and one of the brackets, substantially as specified.

3. The combination, in a coupling, with a draw-head, of a coupling-pin, the rod sliding in suitable brackets and provided with an arm connected to said pin, and a spring-actuated sliding support having its front end extending forward and downward in front of the draw-head, substantially as described.

4. The combination, in a car-coupling, with a draw-head, of the coupling-pin, the rod sliding in suitable brackets and provided with an arm connected to the coupling-pin, the frame secured to the front of the car and provided with a recess, and the spring-actuated sliding support in said recess and having its front end extending down in front of the draw-head, substantially as described.

405,876. CORSET-CLASP. WILLIAM O. CORNISH, Bridgeport, Conn., assignor of one-half to Solon Bryant, Worcester, Mass. Filed Apr. 6, 1889. Serial No. 306,320. (No model.)

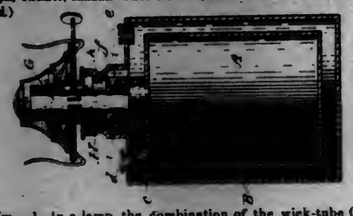


Claim.—1. A corset-clasp consisting of the eye C, fixed to one busk, and the corresponding stud D, secured to the other busk, the combination therewith of a pair of spring-arms $e f$, secured by one end to the busk, their free ends extending toward the rear edge of the busk and terminating in bearings g, a disk-cap i, having a shank l projecting therefrom, the said projection constructed with trunnions $m m$, corresponding to the said bearings g in the said spring-arms, and so as to work therein, the projection extending beyond the pivots to form a cam n to work upon a corresponding surface, substantially as described.

2. The combination of the plate a, slit to form spring-arms $e f$, and an intermediate tongue d, with an opening through it corresponding to the shank of the clasp-stud, the said arms $e f$ terminating at their outer ends in bearings g, combined with a disk i, constructed with a shank l projecting radially therefrom, the said shank constructed with trunnions $m m$, corresponding to the said bearings g, and so as to rest therein, the said shank extending beyond the pivots to form a cam n adapted to work upon the surface under the busk, substantially as and for the purpose described.

3. The combination of the plate a, slit from one end to form spring-arms $e f$, and an intermediate tongue d, the said intermediate tongue d adapted to receive the stud by which the said plate may be secured to the busk, a concavo-convex disk i, constructed with a shank l, the said shank constructed with trunnions $m m$, resting in the said bearings $g g$, and so as to work therein, the said projection extending beyond the pivots to form a cam n, the said concave surface of the disk toward the plate when in the closed position, substantially as and for the purpose described.

405,877. CUFF-HOLDER. NATHAN D. DARGIL, New York, and JOSEPH L. FOLLETT, Brooklyn, N. Y. Filed Apr. 2, 1889. Serial No. 305,762. (No model.)

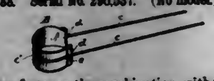


Claim.—1. In a cuff-holder, the combination of the clamp B for engaging the device with the cuff, the body A, having eyes $A' A^2$, and a pin E, carried by lever D, arranged to be moved endwise through the eyes and to engage a portion of a garment P depressed in the space between the eyes, as herein specified.

2. In a cuff-holder, the body A, having eyes $A' A^2$, and means, as the spring-clamp B, for engaging with the cuff M, in combination with the lever D, turning on a pivot C and extending each side thereof, and with a pin E, carried by said lever and playing through said eyes, as herein specified.

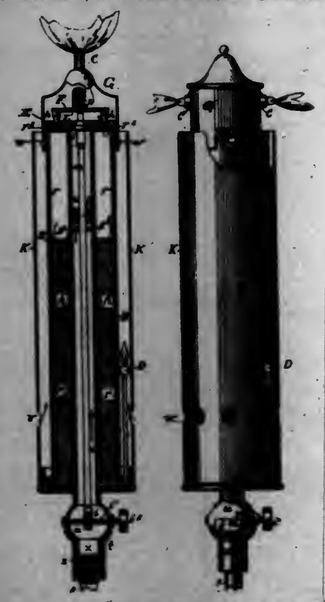
3. In a cuff-holder, the body A, clamp B, and lever and pin D E, in combination with each other and with a dog G, adapted to secure the parts in a locked position and to be engaged and released by

pressure imparted through the flexible material of a garment, as herein specified.



405,878. SAFETY-LAMP. JOHN DAVIDSON and JOHN TAYLOR, Guelph, Ontario, Canada. Filed Nov. 19, 1887. Serial No. 255,569. (No model.)

Claim.—1. In a lamp, the combination of the wick-tube G, the jacket surrounding the same and open at the top, the vessel A, connected to the lower end of the wick-tube, and the vessel B, surrounding the vessel A and connected to the jacket above the former, the said jacket being provided between the exterior of the vessel A and the interior of the vessel B with openings *i*, as shown.



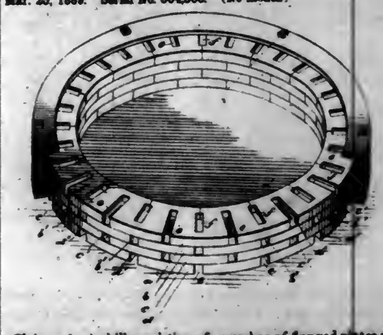
2. In a lamp, the vessel B, having the contracted top opening, the vessel A, located therein and provided with the neck, in combination with the wick-tube, the jacket surrounding the same and open at its top, said jacket having the projecting surface A, formed to fit the opening in the vessel B, the neck *f*, constructed to fit within the neck on the vessel A, and the perforations *i* between the vessels.

405,879. VINE-FASTENER. SAMUEL J. DICKSON, Chicago, Ill. Filed Nov. 12, 1888. Serial No. 290,537. (No model.)

Claim.—In a vine-fastener, the combination, with the open circular band or collar B, provided near its ends with openings *d*, and having its end portions bent or doubled on a line with said openings, of a fastening-wire c, composed of a single length of wire encircling said band and secured thereto by passing its ends through the openings *d* of the band, substantially as set forth.

405,880. CARBURETING-LAMP. LEO DOMS, Vienna, Austria-Hungary. Filed Oct. 2, 1888. Serial No. 286,969. (No model.)

Claim.—1. In a carbureting-lamp, the combination of a receptacle for naphthaline or other hydrocarbon, a gas-burner supported by said receptacle, a gas-pipe extended centrally through the naphthaline-receptacle and supporting the same, said gas-pipe being provided with perforations leading into said receptacle, a plate located at the upper end of the naphthaline-receptacle and provided with openings communicating with said receptacle and with the gas-pipe, a gas-burner adapted for heating the naphthaline-receptacle, a vertically-movable rod supported centrally in the gas-pipe, a perforated piston-valve carried by said rod to control the passage of gas into the naphthaline-receptacle, and valves carried by the upper portion of said rod and adapted to control the passage of gas and mixed gas and vapor through the perforated plate to the burner, substantially as described.



2. In a carbureting-lamp, the combination of a receptacle for naphthaline or other hydrocarbon, an illuminating-gas burner supported by said receptacle, a gas-pipe extended centrally through the naphthaline-receptacle and provided with perforations leading into said receptacle, a gas-burner adapted for heating the naphthaline-receptacle, a jacket surrounding said heating-burner, a plate located at the upper end of the naphthaline-receptacle and provided with openings through which the said receptacle and gas-pipe communicate with the illuminating-burner, a vertically-movable rod supported centrally in the gas-pipe, a perforated piston-valve carried by said rod and adapted to control the passage of gas into the naphthaline-receptacle, and valves carried by the upper portion of said rod to control the passage of gas and mixed vapor and gas to the illuminating-burner, substantially as described.

405,881. LIQUID-FUEL BURNER. WILLIAM R. EASTMAN, Boston, Mass., assignor to the Eastman Freight Car Heater Company, Portland, Me. Filed Dec. 5, 1888. Serial No. 292,738. (No model.)

Claim.—The liquid-fuel burner consisting of three concentric cylinders, the intermediate cylinder being slightly smaller in diameter than the outer cylinder, whereby an annular chamber is formed, the latter cylinder provided near the bottom with an inlet-passage for oil and communicating with said annular passage, and near the top provided externally with an annular fuel-pan, in combination with the air-deflector consisting of three concentric deflector-plates forming annular air-passages, the inner plate supporting the outer plate, and provided with a collar or tube secured within the inner cylinder, and the deflecting-plate secured to the upper margin of the intermediate cylinder and located below the middle plate, whereby a series of concentric air-passages are formed for the discharge of air to the fuel-pan, substantially as described.

405,882. CHILL. WILLIAM FAWCETT, Rochester, N. Y. Filed Mar. 26, 1889. Serial No. 304,580. (No model.)

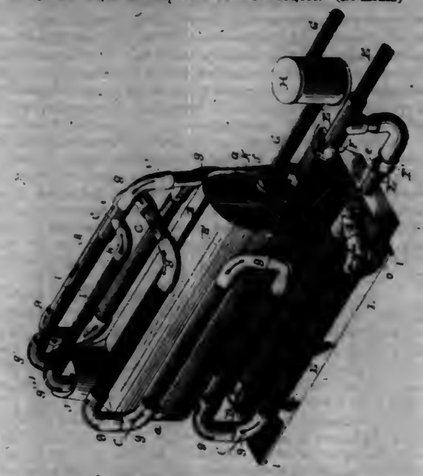
Claim.—1. A chill consisting of a number of flanged plates resting one upon another, and each provided with slots to connect the air-spaces between the several plates, substantially as described.

2. A chill consisting of a number of plates provided on each edge with a flange, and having openings *f* between the flanges, slots *e* extending through the outer flange, and kerfs or slits extending through the inner flanges to the openings *f*, substantially as described.

3. A chill consisting of a number of superposed plates having flanges effecting air-spaces between them, and a ring embracing the periphery of the assembled plates, substantially as described.

4. A chill for wheels, consisting of a number of plates secured together, each provided in its inner edge with slits arranged to break joints with those of the adjoining plate, substantially as described.

5. A chill for wheels, consisting of a number of superposed plates having air-spaces between them, and each provided with slits in its inner edge arranged to break joints with those of the adjoining plate, substantially as described.



405,883. INHALER. WILLIAM R. GARR, Meriden, Conn. Filed Mar. 20, 1889. Serial No. 303,903. (No model.)

Claim.—1. A pan for administering face vapor-baths, provided with holes in the sides for the admission of atmospheric air, and hoods secured to the outside over said holes, whereby the pan is provided with handles and the escape of vapor from the pan is retarded, as set forth.

2. A pan for administering face vapor-baths, having holes in the sides for the admission of air and provided with flexible tubes for connecting said holes with the nostrils of the patient, as set forth.

405,884. HYDROCARBON-BURNER. THOMAS R. HALL, Kansas City, Mo. Filed Mar. 30, 1889. Serial No. 304,008. (No model.)

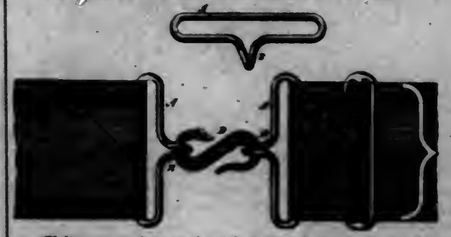
Claim.—1. In a retort vaporizer and burner, the combination, with the independent retorts for water and hydrocarbons and a burner arranged thereunder, of a single continuous superheating-pipe connected to both retorts and to the burner and doubled on itself back and forth on opposite sides of the retorts and over the burner, whereby it is heated by the combustion at the said burner, substantially as specified.

2. In a retort vaporizer and burner, the combination, with a horizontal oil-pan having a burner located therein, of their dependent retorts provided with water and hydrocarbon-supply pipes and located centrally over said pan, and the single continuous superheating-pipe connected at one end to both retorts and at the other end to the burner and doubled back and forth parallel with and on opposite sides of the retorts and above the oil-pan, whereby said pipe is heated by the combustion in the pan, substantially as specified, for the purpose set forth.

3. In a retort vaporizer and burner, the combination of an oil-pan provided at opposite sides with horizontal plates having flanges, and also provided with a central longitudinal burner, the two independent retorts arranged side by side over the center of the oil-pan, and the single continuous superheating-pipe, connecting both retorts with the burner, extending back and forth in a zigzag direction at opposite sides of the retorts and bearing on and supported in said position by the flanged side plates of the oil-pan, substantially as specified.

405,885. LUBRICATOR. THOMAS J. HART, Buffalo, N. Y., assignor to Pelthousen & Sherwood, same place. Filed Oct. 20, 1888. Serial No. 288,641. (No model.)

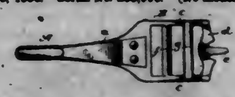
Claim.—1. In a lubricator, the combination, with the oil-chamber provided with a central discharge-passage c' in its bottom, and a lateral discharge-passage c^2, forming a communication between the oil-chamber and the central discharge-passage, of a regulating-valve arranged in the central discharge-passage and provided with a valve-stem extending through the top of the oil-chamber, whereby the flow of oil from the lateral discharge-passage into the central discharge-passage is regulated, and a cut-off valve arranged in the lateral discharge-passage and provided with a valve-stem extending through the top of the oil-chamber on one side of the stem of the regulating-valve, whereby the communication between the central discharge-passage and the oil-chamber can be closed without disturbing the position of the regulating-valve, substantially as set forth.



2. The combination, in a lubricator provided with a discharge-passage c', and a lateral passage c^2, communicating with said discharge-passage, of an upright tube d, arranged within the lubricator above the passage c', and provided with an internal screw-thread, a regulating-valve e', arranged within said tube and provided with an external screw-thread, and a cut-off valve arranged within the lubricator, controlling the lateral passage c^2, and having a stem extending through the cap of the lubricator, substantially as set forth.

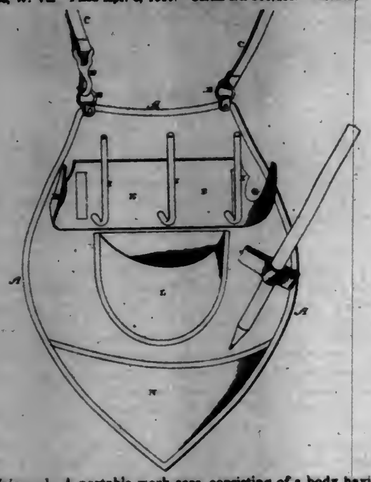
3. The combination, with the oil-chamber of the lubricator provided with a discharge-passage c', and a lateral passage c^2, communicating with the same, of a regulating-valve arranged in said discharge-passage, a cut-off valve arranged in the lateral passage c^2, and provided with a stem extending through the top of the oil-chamber, a spring whereby said valve is depressed, an incline arranged at the top of the lubricator, and a pin or projection arranged on said valve-stem and adapted to bear against said incline, substantially as set forth.

4. The combination, in a lubricator provided in its top with a feed-opening l, of a laterally-swinging arm M, pivoted to the top of the lubricator and provided on its under side with a recess arranged above the opening l, and a cap n', arranged above said recess, a valve n, arranged in said recess and inclosed by the arm M, and a spiral spring n^3, inclosed by said cap and bearing upon the valve, whereby the latter is depressed in its seat, substantially as set forth.



5. The combination, with the cylinder A and the cap B, provided with a depending sleeve h^3, having notches h', of the head B', and the tube d, provided with pins h, engaging in said notches, whereby the cap is held against turning on the cylinder A, substantially as set forth.

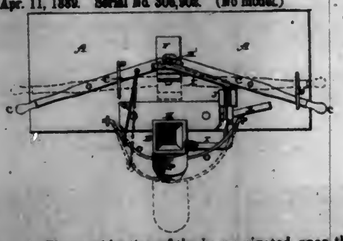
405,886. WAIST-BELT LOOP. FRANK J. HERRICK, New Britain, Conn. Filed Dec. 20, 1888. Serial No. 294,195. (No model.)



Claim.—As an improved article of manufacture, a waist-belt loop comprising an elongated oval loop with the eye B formed on a side bar thereof and disposed spirally with relation thereto, leaving a substantially U-shaped opening in the portion of the eye which intersects the elongated opening of the loop, all the parts of the device being of comparatively uniform size throughout.

405,887. COMBINED SNAP-HOOK AND LOOP. LESLIE HEWITT, Buffalo, N. Y., assignor of one-half to Pratt & Letchworth, same place. Filed Dec. 18, 1888. Serial No. 293,906. (No model.)

Claim.—As an improved article of manufacture, the combined snap-hook and loop herein described, consisting of the hook A and the loop B, having side bars c c, extending rearwardly from the shank of the hook, a rear cross-bar d, connecting the rear ends of the side bars, a curved tongue e, formed on the upper side of said cross-bar and projecting rearwardly therefrom, a front cross-bar f, and a raised cross-bar g, arranged between the front and rear cross-bars f and d, substantially as set forth.



405,888. PORTABLE WORK-CASE. JAMES H. JEFFERSON, Moundsville, W. Va. Filed Apr. 8, 1889. Serial No. 306,410. (Model.)

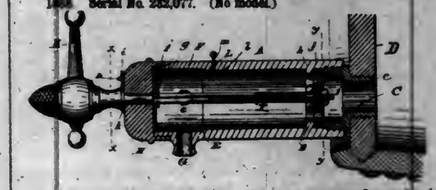
Claim.—1. A portable work-case consisting of a body having a supporting-band secured thereto, a plate secured thereto horizontally, having one end turned upward and sharpened to form a thread-cutter, and wires secured to the plate upon which the spools are placed, substantially as specified.

2. A portable work-case consisting of a body having a supporting-band connected thereto, a plate secured to the body horizontally, and having its ends turned outward from the body and formed into hooks, one of the hooks being sharpened, for the purpose substantially as specified.

405,889. CAR-COUPLING. ANDREW H. JOHNSON, Tryus, Miss. Filed Apr. 11, 1889. Serial No. 306,908. (No model.)

Claim.—1. The combination of the levers pivoted upon the end of the car having their ends loosely connected together, the lifter provided with a catch, and the partially-revolving spring-actuated support which has its upper end to engage with the catch on the lifter and its lower bent end to project beyond the front of the draw-head, substantially as shown.

2. The combination of the pivoted levers upon the end of the car, the slotted lifter provided with a catch, the partially-revolving spring-actuated support pivoted upon the end of the car and having its upper end to engage with the catch, while its lower end projects beyond the draw-head, the rod O, the guiding-plate P, secured thereto, and the chain Q, for connecting the rod to one of the levers, substantially as shown and described.



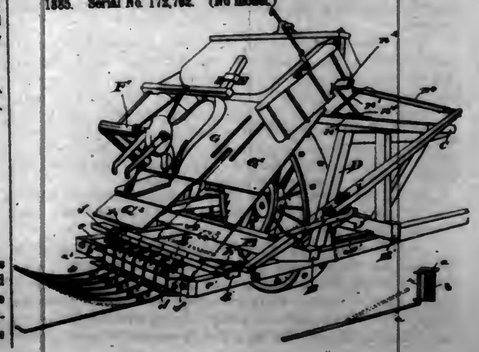
405,890. MACHINE FOR BUILDING WIRE-AND-PICKET FENCES. JESSE M. KEITH, Albany, Oreg. Filed Mar. 5, 1889. Serial No. 301,905. (No model.)

Claim.—1. In a fence-machine, the combination of the uprights carrying the twisters, the cups or sockets fitting on the upper and lower ends of the uprights, the plate or lug secured to the side of the uprights having an opening therein, an angular step having the vertical limb thereof fitting in the opening of the lug and having a series of perforations in said limb, and the screw passing through the lug and adapted to engage one of the perforations of the step, substantially as described.

2. In a fence-machine, the combination, with the uprights, of the lug or guide having a slot or opening therein, the angular step having a series of openings in the vertical limb thereof, and the screw in the guide adapted to engage one of the perforations of the step to adjust the same to different heights, substantially as described

405,891. MEASURING-FAUCET. JAMES H. KELL, Washington, D. C., assignor of one-half to Frank Aldrich, same place. Filed Aug. 6, 1888. Serial No. 282,077. (No model.)

Claim.—1. The combination, with a measuring-faucet having a perforated diaphragm near one end extending across its inner chamber, of a valve of the same size and form as the diaphragm, having openings registering with the perforations, said valve being adapted to turn to open and close the perforations, and a rod connected therewith and extending to the opposite end of the faucet and attached to a key-plug operating within the faucet and screw-cap for opening and closing an exit-port, as set forth.



2. The combination, with a diaphragm across one end of the chamber having holes or perforations around its center, of a valve of the same form as the diaphragm on a rod extending through the diaphragm, provided with openings registering with those in the diaphragm, and a hollow key-plug at the opposite end having a hole in its side secured to the rod and its inner surface smooth with the inner surface of the faucet, said rod being adapted to turn the valve on the diaphragm and the key-plug over an exit-opening in the shell of the faucet, as set forth.

3. The combination, with a measuring-faucet having means at one end of the shell for opening and closing its reservoir-orifices, and a recess in the inner opposite end of the shell, of a hollow key-plug within said recess having its inner wall flush with the surrounding inner wall of the shell, said plug having a hole in its side adapted to alternately register with an exit-port as the reservoir-orifice is opened and closed, as set forth.

4. The combination, with a measuring-faucet having a perforated diaphragm across its chamber at one end integral with the shell, a turning-valve on the side of the diaphragm, and a hollow key-plug in a recess on the inner wall of the shell at the opposite end, of a screw-cap on the end of the shell in contact with the head of the key-plug, and a rod journaled in the screw-cap and diaphragm and passing through and having secured thereto the valve and hollow key-plug, as set forth.

5. The combination, with a shell having a perforated diaphragm in one end, with a valve opening and closing the same, and a key-plug in a recess in the opposite end of the shell registering with an exit-port, of a screw-cap on the end of the shell having stop-lugs, and a rod journaled in the cap and diaphragm carrying the valve and key-plug and having an indicating-arm thereon working between the stop-lugs, as set forth.

405,892. SHEAF-CARRIER FOR SELF-BINDING HARVESTERS. BURR A. KENNEDY and JOHN P. STEWARD, Chicago, Ill. Filed July 27, 1885. Serial No. 172,762. (No model.)

Claim.—1. A sheaf-carrier composed of a series of fingers journaled in a supporting-bar upon journals or axes normally vertical, the bearings for the journals being constructed substantially as described, whereby, when the fingers are swung to the rear to discharge the load, by being turned on their vertical journals, said journals may assume an inclined position to drop the ends of the fingers to the ground.

2. In a sheaf-carrier, a series of sheaf-carrying fingers, each having at the inner end an upright pivot or journal rigid thereon, in combination with a sustaining-bar provided with journal-bearings elongated at one end in a fore and aft direction, substantially as shown, to permit the journals to assume an inclined position and lower the outer ends of the fingers when the latter are turned to the rear.

3. In a sheaf-carrier, the sustaining-bar with the bearings elongated at one end in a fore and aft direction, in combination with the fingers having the upright pivots or journals and the crank-arms, the connection between said crank-arms, and controlling mechanism extending to a point adjacent to the driver's seat, whereby the driver is enabled to control the horizontal motion of the fingers and thereby their vertical motion.

4. The combination, with a dumping sheaf-carrier, of mean for holding the same in position to hold the sheaves, and a trip-arm outreaching from the carrier and adapted to strike the sheaves deposited by the carrier on the preceding round of the machine, whereby the automatic dumping action of the carrier is secured.

5. In a sheaf-carrier, a series of outreaching sheaf-receiving fingers individually pivoted to swing rearward in dumping, one of said fingers extended stubbleward beyond the remainder to encounter the previously-deposited sheaves, in combination with the connection between the fingers to compel their movement in unison, whereby the extended finger or trip is caused to move the others on encountering the fallen sheaves.

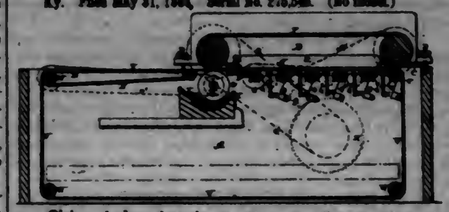
6. In combination with a dumping sheaf-carrier and means for locking the same in its receiving position, an elastic outreaching trip-finger adapted to encounter the previously-deposited sheaves, whereby the finger is enabled to automatically trip the carrier or to yield and pass the fallen sheaves when the carrier is prevented from moving.

405,893. HAND-CAR. ALBERT F. KUHL, Van Wert, Ohio. Filed Apr. 4, 1889. Serial No. 305,985. (No model.)

Claim.—1. In a car provided with hand propelling mechanism, substantially as shown, brake-levers B B', one located to one side of the propelling mechanism and the other to the rear thereof, the lower ends of said brake-levers being connected by a bar, and a link for connecting one of the levers to a crank-rod carrying brake-shoes, substantially as shown, and for the purpose set forth.

2. In a hand-car, a superstructure or housing therefor, consisting of a top connected to a frame for supporting and bracing the same, side strips D and F, having grooves *f f* for supporting side sections, substantially as shown, and for the purpose set forth.

3. In a car, a roof having front and rear portions which extend beyond the frame thereof, angular depending end pieces, the supporting corner-posts, and end doors hung to the corner-posts and provided with angular bottom plates, the parts being organized substantially as shown.



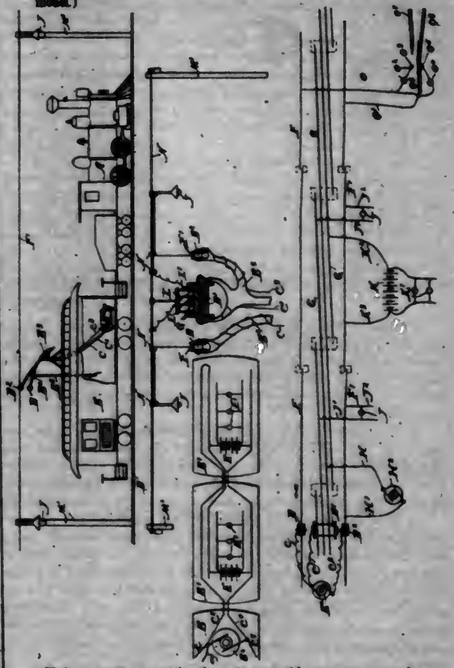
4. In a car, a removable superstructure supported upon corner-posts, said corner-posts being provided with eyebolts, and doors hinged thereto, said doors being adapted to meet in front of the car, substantially as shown.

5. In a car, end doors constructed substantially as shown and provided with angular extensions which, when the doors are closed, form a continuation of the floor-boards, for the purpose set forth.

6. In combination with a car, the end doors supported upon hinges and provided at their lower ends with inwardly-extended pieces, which are adapted to meet when the doors are closed, said doors having windows supported in angular frames, substantially as shown, and for the purpose set forth.

7. In combination with a housing for hand-cars, end doors hinged to the side frames so as to meet beyond the car-body, the doors being at an angle, as shown, with the sides of the car.

405,894. BRONZING-MACHINE. CHRISTIAN LANDOLT, Louisville, Ky. Filed May 31, 1888. Serial No. 275,549. (No model.)

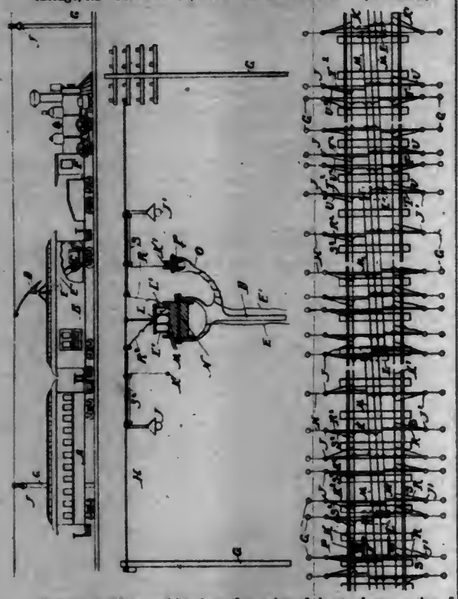


Claim.—1. In a bronzing-machine, an endless stencil provided with suitable perforations, in combination with the endless belt F, which serves to carry the printed matter through the machine, and mechanism for operating the stencil and the belt, substantially as shown.

2. The combination, with an endless stencil provided with perforations, of the bronzing-roller, the endless belt F, the rollers for brushing and cleaning the bronze through the openings in the stencil, and suitable operating mechanism for the endless belt, stencil, and rollers, substantially as described.

3. The combination of the upper frame, the pulleys placed therein, the endless belt which passes around the pulleys, and the boards placed inside of the frame for pressing the belt down upon the cleaning and polishing rollers, substantially as described.

405,895. COMBINED TRACK AND TRAIN LIGHTING. HARRY W. LEONARD, Chicago, Ill. Filed Feb. 7, 1889. Serial No. 299,012. (No model.)



Claim.—1. The combination of a movable generator, conductors, and translating devices connected thereto, energized therefrom, and moving therewith, a series of fixed conductors and translating devices connected therewith, and a movable connection from the generator to the fixed conductors to complete the circuit therethrough, and thus energize the fixed translating devices from the movable generator, some of such fixed translating devices being normally always energized.

2. The combination of a movable generator, conductors, and translating devices connected thereto, energized therefrom, and moving therewith, a series of fixed conductors and translating devices connected therewith, and a movable connection from the generator to the fixed conductors to complete the circuit therethrough, and thus energize the fixed translating devices from the movable generator, some of such fixed translating devices being normally always energized, said

fixed conductors overlapping, so as to be in contact with the movable connection in such manner as to keep one of them normally always in contact with such conductors.

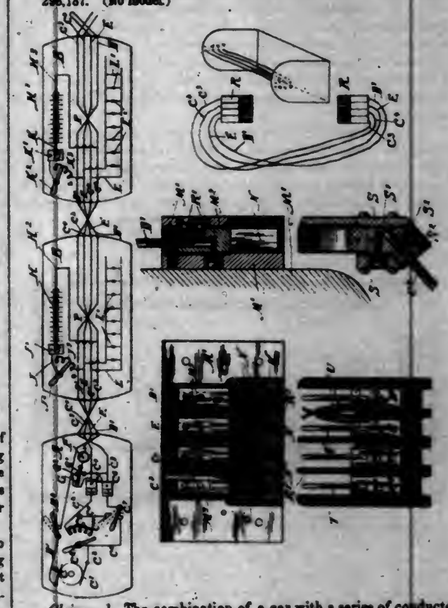
3. The combination of a movable generator, conductors, and translating devices connected thereto, energized therefrom, and moving therewith, a series of fixed conductors and translating devices connected therewith, and a movable connection from the generator to the fixed conductors to complete the circuit therethrough, and thus energize the fixed translating devices from the movable generator, some of such fixed translating devices being normally always energized, said local or fixed translating devices consisting in part of local systems containing converters, such as storage-batteries.

405,896. ELECTRIC-LIGHTING SYSTEM. HARRY W. LEONARD, Chicago, Ill. Filed Jan. 19, 1889. Serial No. 296,862. (No model.)

Claim.—1. The combination of a series of short wires, a series of long wires, a generator of electricity, a branched connector leading therefrom to the short wires and either one of the long wires, as the case may be, and series of lamps connected some with the short wires and one of the long wires and others with the short wires and another of the long wires.

2. The combination of a series of short overlapping wires, two long wires, two series of lamps connected one series from one long wire, the other series from the other long wire, and both to the short wires, and a generator movable along such wires and a branched connector leading therefrom to the short wires and one of the long wires.

3. The combination of a series of fixed conductors, a series of translating devices connected therewith, a generator movable along such conductors, a movable connector normally in contact with at least one of such conductors and one pole of the generator, and connectors between the other pole of the generator and some of such conductors, the circuit being thus completed through a translating device, so as to successively energize such translating devices from the moving generator and normally to keep some of them constantly energized.



4. The combination of a series of fixed conductors, a series of electric lamps connected therewith, a generator movable along such conductors, a movable connector normally in contact with at least one of such conductors and one pole of the generator, and connectors between the other pole of the generator and some of such conductors, the circuit being thus completed through a translating device, so as to successively energize such electric lamps from the moving generator and normally to keep some of them constantly energized.

5. The combination of a series of fixed overlapping conductors, a series of translating devices connected therewith, a generator movable along such conductors, a movable connector normally in contact with at least one of such conductors and one pole of the generator, and connectors between the other pole of the generator and some of such conductors, the circuit being thus completed through a translating device, so as to successively energize such translating devices from the moving generator and normally to keep some of them constantly energized.

6. The combination of a series of fixed conductors along a railroad-track, a series of translating devices connected therewith, a movable generator adapted to be carried along the track, a movable connector from one pole of the generator and normally in contact with at least one of such conductors, and connections from the other pole of the generator to some of such conductors, the circuit being thus completed through a translating device, so that the translating devices are successively energized from the generator moving on the track and some of them always energized when in operation.

7. The combination of a series of fixed conductors, a series of incandescent lamps connected therewith, a generator movable along such conductors, a movable connector normally in contact with at least one of such conductors and one pole of the generator, and connectors between the other pole of the generator and some of such conductors, the circuit being thus completed through a translating device, so as to successively energize such incandescent lamps from the moving generator and normally to keep some of them constantly energized.

405,897. SYSTEM OF ELECTRIC LIGHTING FOR RAILWAY-CARS. HARRY W. LEONARD and AUGUSTUS HANSON, Chicago, Ill.; said Hanson assignor to said Leonard. Filed Jan. 31, 1889. Serial No. 298,187. (No model.)

Claim.—1. The combination of a car with a series of conductors thereslong so arranged that the terminal of each is on opposite sides of each of the other terminals at the two ends of the car.

2. The combination of a car with a series of conductors thereslong, two of which together constitute, when in action, a return-loop, said conductors so arranged that the terminals of the two conductors forming the loop have opposite relative position with reference to the remaining conductor-terminals at each end of the car.

3. The combination of a series of cars with a series of conductors in each car and connectors between such conductors, said connectors containing wires so arranged that the conductor-terminals in one car are connected each with oppositely-located conductor-terminals on the adjacent car.

4. The combination of a series of cars with a series of conductors thereslong so arranged that the terminal of each is on opposite sides of each of the other terminals at the two ends of the car, and a connector provided with wires so arranged that the conductors of one car are connected each with the oppositely-arranged conductors on the adjacent car.

5. In a system of electric lighting for cars, a connector to couple adjacent cars, consisting of two similar coupling-pieces, having a series of terminals and crossed wires leading from one to the other, and coupling-blocks having each a series of terminals.

6. In an electric-lighting system for cars, the combination of cars and conductors with coupling-blocks at each end of each car containing two terminals normally in contact, so as with their conductors to make a return-loop closed at such coupling-block, and two terminals normally not in contact with a coupler adapted to open such loop and connect all the terminals with the terminals of the coupler.

7. In an electric-lighting system for cars, a coupler provided with two similar coupling-pieces and connecting-wires, each piece having two terminals normally in contact and two normally not in contact, in combination with a coupling-block containing the terminals of the car-conductors, said closed terminals on the coupler adapted to be opened and connected with terminals in the coupling-block when the two are brought together.

8. In an electric-lighting system for cars, a coupler provided with two similar coupling-pieces and connecting-wires, each piece having two terminals normally in contact and two normally not in contact, in combination with a coupling-block containing the terminals of the car-conductors, two of which are normally in contact, and contact-breaking plates on the block and the coupling-piece, so that when interlocked such connected terminals are separated.

9. In an electric-lighting system for cars, the combination of the cars, conductors, and coupling-blocks which contain the terminals of such conductors, two of said terminals normally in contact and two normally not in contact, with a coupler consisting of coupling-pieces and connecting-wires, said pieces containing the terminals of said wires, and two of such terminals normally in contact and two normally not in contact, and contact-breakers, one on the block and one on each coupling-piece, so that when the block and pieces are interlocked all of such closed terminals are opened and each car-conductor is connected with its respective coupler-wire.

10. In an electric-lighting system for cars, the combination cars and their conductors with coupling-blocks, one at each end of each car, containing the terminals of such conductors, two of such terminals normally in contact and two normally not in contact, with a coupler consisting of two coupling-pieces and connecting-wires, the terminals of such wires in such coupling-pieces, and two at each end normally in contact and two normally not in contact, and one contact-breaker on each block and each piece.

11. In an electric-lighting system for cars, the combination of a generator with a main conductor leading from one pole, a compound conductor leading from the other, storage-batteries, and lamps, as required for the cars, said batteries coupled between the main and one branch of the compound conductor, and the lamps between the main and the other branch of the compound conductor.

12. In an electric-lighting system for cars, the combination of a generator with a main conductor leading from one pole, a compound conductor leading from the other, storage-batteries having a variable resistance in series with each set, should more than one set be used, and lamps, as required for the cars, said batteries coupled between the main and one branch of the compound conductor, and the lamps between the main and the other branch of the compound conductor.

13. In an electric-lighting system for cars, the combination of a generator with a main conductor leading therefrom and a return-conductor connected therewith so as to form a loop, and a compound conductor leading from the other pole, the storage-batteries, and lamps, as required for the cars, said storage-batteries coupled between the return-conductor and one branch of the compound conductor, and said lamps between the return-conductor and the other branch of the compound conductor.

14. In an electric-lighting system for cars, the combination of a generator with a main conductor leading from one pole and a compound conductor leading from the other, consisting of two branch conductors, one of which contains a variable resistance, and a voltmeter and connections from the main conductor to either of the branch conductors, so as to test the difference of voltage between the main and either of the branch conductors.

15. In an electric-lighting system for cars, the combination of a generator with a main conductor leading from one pole and a compound conductor leading from the other, and consisting of two branch conductors, one of which contains a variable resistance, storage-batteries, and lamps, as required for the cars, the lights coupled between the main conductor and that branch of the compound conductor containing the variable resistance, and the storage-batteries between the main conductor and the other branch of the compound conductor.

16. In an electric-lighting system for cars, the combination of a generator with a main conductor leading therefrom, a return-wire connected with such main conductor so as to form a loop, a compound conductor leading from the other pole of the generator having two branches, and a voltmeter and connections, so that such return or main wire may be connected through such voltmeter with either branch of the compound conductor.

17. In an electric-lighting system for cars, the combination of a generator with a main conductor leading therefrom, a return-wire connected with such main conductor so as to form a loop, a compound conductor leading from the other pole of the generator having two branches, and a voltmeter and connections, so that such return or main wire may be connected through such voltmeter with either branch of the compound conductor, and an ampere-meter in each branch of said compound conductor.

18. In an electric-lighting system for cars, the combination of a generator with a main conductor leading therefrom, a return-wire connected with such main conductor so as to form a loop, a compound conductor leading from the other pole of the generator and having two branches, and an ampere-meter in each branch of said compound conductor.

19. In an electric-lighting system for cars, the combination of a generator with a main conductor leading therefrom, a compound conductor leading from the other pole of the generator having two branches, an ampere-meter in each of said branches, means for connecting the two branches when the generator is disconnected, and storage-batteries and lights coupled between the main and such branch conductors, respectively, so that when the generator is out of circuit and the branch conductors connected the two ampère-meters will be coupled in series with the batteries and lights.

20. In an electric-lighting system for cars, the combination of a generator with a main conductor leading therefrom, a return-wire connected with such main conductor so as to form a loop, a compound conductor leading from the other pole of the generator having two branches, and a voltmeter and connections, so that such return or main wire may be connected through such voltmeter with either branch of the compound conductor, and an ampere-meter in each branch of said compound conductor, and a variable resistance in one branch thereof.

21. In an electric-lighting system for cars, the combination of a generator with a main conductor leading therefrom, a return-wire connected with such main conductor so as to form a loop, a compound conductor leading from the other pole of the generator having two branches, and an ampere-meter in each branch of such conductor, and a variable resistance in one branch of such compound conductor.

22. In an electric-lighting system for cars, the combination of a generator with a main conductor leading therefrom, a compound conductor consisting of two branches leading from the other pole, and switches in the main conductor and both branches of the compound conductor.

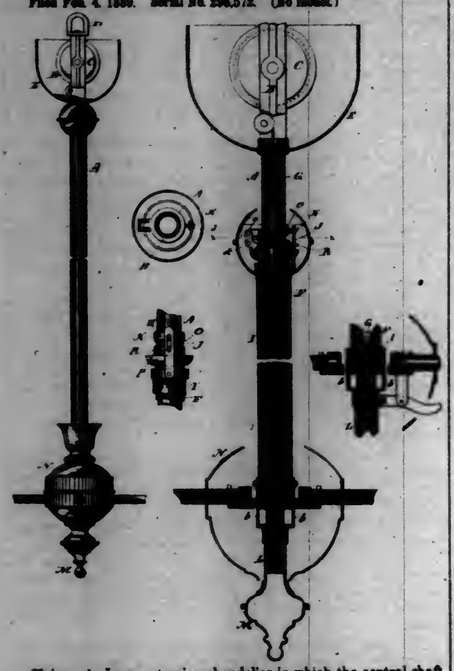
23. In an electric-lighting system for cars, the combination of the generator with a main conductor leading from one pole thereof, a compound conductor leading from the other pole thereof and composed of two conductors running through the train, a resistance in such compound conductor, so as to secure a difference of potential on the two wires of the compound conductor, and lamps coupled between the main conductor and one branch of the compound, and batteries between the main conductor and the other branch of the compound conductor.

24. In an electric-lighting system for cars, the combination of the cars with a series of car-conductors leading therealong and having their terminals at each end of each car so arranged as always to occupy the same relative positions to each other when considered as series, as from right to left in a horizontal line, from top to bottom in a vertical line, and the like, and viewed from without the car.

25. In an electric-lighting system for cars, the combination of a car with a series of conductors therealong, said conductors so arranged that the terminals of some of them have opposite relative positions with reference to the remaining conductor-terminals at each end of the car.

26. In an electric-lighting system for cars, the combination of a generator with a main conductor leading therefrom and a compound conductor leading from the other pole and consisting of two branches, each of which contains an ampere-meter.

27. The combination of a generator with conductors leading therefrom, two or more sets of storage-batteries, and also lamps in multiple arc across such conductors, each set of storage-batteries having each of its cells at all times in series with and therefore subjected to the same current as every other cell in that set, and each set of storage-batteries having a variable resistance in series with it.

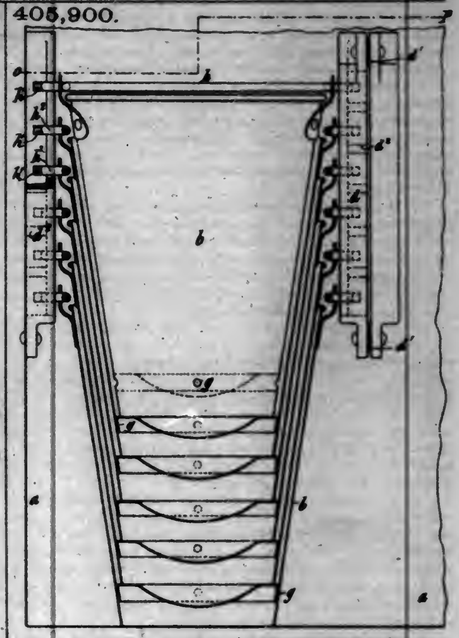


405,898. TOOL-HANDLE. NEWTON LEMLEY, Prospect, Ill. Filed Dec. 19, 1888. Serial No. 294,144. (No model.)

Claim.—The combination, with a handle having a cylindrical socket whose outer portion is of greater diameter than its inner portion, of a tool-shank equal in diameter to said outer portion, and having a prismatic end adapted to readily enter said outer portion, but requiring pressure to force it into said inner portion, substantially as set forth.

405,899. EXTENSION-CHANDELIER. CHARLES MASONEYER, Meriden, Conn., assignor to the Edward Miller & Company, same place.

Filed Feb. 4, 1889. Serial No. 298,572. (No model.)



Claim.—1. In an extension-chandelier in which the central shaft is composed of telescopic tubes, the one part being stationary from the ceiling, the other part vertically adjustable thereon and carrying the lamps, the combination therewith of an engaging device between the said tubes, a tube outside of and surrounding the adjustable tube as a jacket, the said jacket arranged for vertical movement independent of the tube it surrounds, its upper end in connection with the said engaging device, and the said jacket-tube extending downward with a connection from its lower end downward through the arm-supporting collar, with the tip of the chandelier below the said supporting-collar attached to said connection, so as to serve as the handle by which the said jacket-tube may be moved, substantially as described.

2. In an extension device substantially such as described, in which the central shaft is composed of telescopic tubes, the one part being stationary and the other vertically adjustable thereon and carrying the lamps, the combination therewith of two cramps H P, hung to the adjustable tube one above the other, both surrounding the stationary tube, the opening through the two cramps being of greater diameter than the diameter of the stationary tube, with a spring between the two, the tendency of which is to force the two cramps into oppositely-inclined positions, a tube I outside the adjustable tube, but movable vertically thereon, an arm extending from the said tube I into connection with the said two cramps, and so that the vertical movement of the said tube I in one direction will turn one of the cramps and in the opposite direction will turn the other cramp, the said tube I extending to a convenient point and terminating in means for imparting vertical movement thereto, substantially as described.

3. In an extension device substantially such as described, in which the central shaft is composed of telescopic tubes, the one part being stationary and the other vertically adjustable thereon and carrying the lamps, the combination therewith of two cramps H P, hung to the adjustable tube one above the other, both surrounding the stationary tube, the opening through the two cramps of greater diameter than the diameter of the stationary tube, with a spring between the two, the tendency of which is to force the two cramps into oppositely-inclined positions, and a connection extending from the said cramps and through which the said cramps may be operated, substantially as described.

405,900. APPARATUS FOR STORING PAILS WITH WATER OR OTHER LIQUIDS. FREDERICK A. MEEKEN and WALTER F. THORPE, London, England. Filed Apr. 2, 1889. Serial No. 305,730. (No model.) Patented in England June 23, 1886, No. 9,308.

Claim.—1. The combination of a fluid-containing tank and a series of pails telescoped one within the other and wholly submerged in the fluid in the tank and adapted to be individually removed filled with the fluid, substantially as described.

2. The combination of a fluid-containing tank and a series of tapering pails of gradually-reduced diameter arranged one within the other and all submerged in the fluid in the tank and capable of being successively removed filled with the fluid, substantially as described.

3. The combination of a fluid-containing tank having attached fittings *d*, provided with the stops d^3, and a series of submerged pails having swinging handles A, provided with trunnions A^3, having projections A' to engage the stops, substantially as described.

4. The combination of a fluid-containing tank having attached vertically-slotted fittings *d*, provided with lateral stops d^3, and a series of submerged pails telescoped one within the other and provided with swinging handles A, having trunnions A^3 extending through the slots of the fittings and provided with projections A', which engage the stops, substantially as described.

5. The combination of a fluid-containing tank, a series of pails telescoped one within the other and submerged in the tank, and means, substantially as described, for holding the pails in their telescoped position.

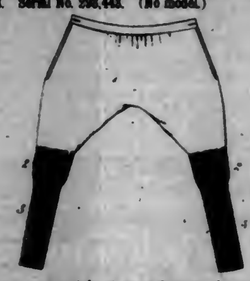
6. The combination of a fluid-containing tank, a series of submerged pails telescoped one within the other and provided with handles having projections A', and devices engaging the projections to hold the pails submerged, substantially as described.

405,901. HYDROCARBON-OIL BURNER. WILLIAM B. MYERS, Springfield, Ohio, assignor of one-half to John P. Bartley, same place.

Filed Apr. 7, 1888. Serial No. 269,967. (No model.)

Claim.—1. In an oil-burner, the combination, with a retort having a cylindrical extension, of burners in the vertical walls of the extension, an oil-supply tube leading into the retort, and a deflector below the extension having openings or spaces formed in its outer edge, substantially as described.

2. In an oil-burner, the combination, with a retort having a cylindrical extension and a valved oil-supply tube leading into the retort, of a curved diaphragm or spreader having serrated edges located within the retort, substantially as described.



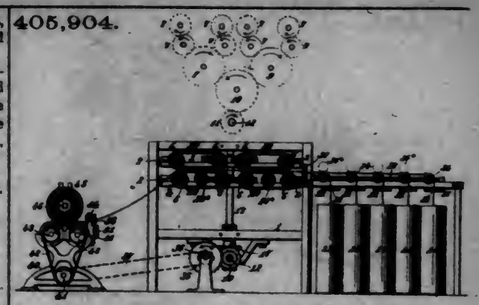
3. In an oil-burner, the combination, with a retort having a cylindrical extension from its under side and a burner at its upper side and burners in the walls of the extension, of an oil-tube leading into the retort through the extension, a diaphragm or spreader secured on the end of the tube within the retort, and a deflector below the extension, substantially as described.

405,902. JAR. EDWARD C. HAPGOOD, Philadelphia, Pa. Filed Apr. 11, 1889. Serial No. 306,890. (No model.)

Claim.—The combination, with a jar and its cover, of a bail or handle composed of a piece of wire bent to form a loop or handle, and having its ends passed through suitable openings upon opposite sides of the cap or cover, said ends being screw-threaded and provided with rubber washers *b* on the inside of the cover, substantially as described, and for the purpose specified.

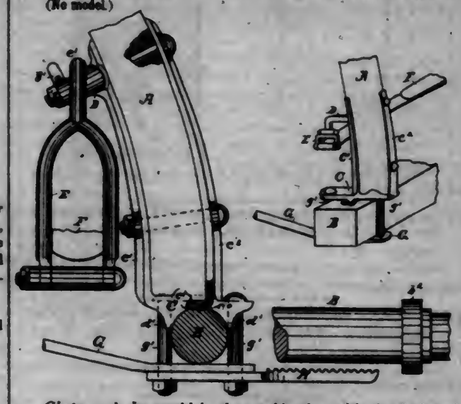
405,903. DRAWERS, &c. CHARLES F. NORTH, Cohoes, N. Y. Filed Dec. 13, 1888. Serial No. 293,443. (No model.)

Claim.—As a new article of manufacture, the pantalets herein described and shown, consisting of the upper portion 1, extending from above the knee to the waist, of the ordinary fullness and dimensions to render the same loose and easy around the waist, hips, seat, and thighs, the contracted knitted tuck-stitch knee-sections 2, to closely fit and form braces for the entire knees and stitched to the loosely-fitting upper portion, and the knitted calf and ankle sections 3, contracted from the knee-sections downward to closely fit the calves and ankles and forming continuations of the tuck-stitch knee-sections, substantially as set forth.



405,904. METHOD OF CARDING COTTON. JESSE V. PALMER, Greenwich, N. Y. Filed Dec. 27, 1888. Serial No. 294,757. (No model.)

Brief.—The method is designed for use in the production of yarn for hosiery and knit underwear, and avoids the objections incidental to the use of first and second breaker-cards.

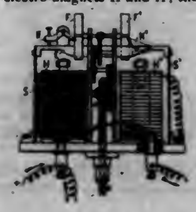


Claim.—1. The method of preparing cotton for spinning, which consists in carding and doubling the same, as usual, and delivering the slivers from the can of the doubler, railway-head, or drawing-frame to a wool-finishing card, substantially as described.

2. The method of preparing cotton for spinning, which consists in carding and doubling the same, as usual, then rubbing the slivers separately, and then subjecting them to the action of a wool-finishing card, substantially as described.

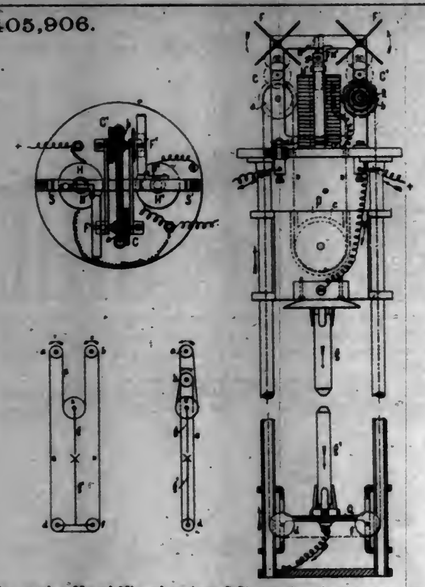
3. The method of preparing cotton for spinning, which consists in carding on cotton cards, doubling the slivers, as usual, rubbing the double slivers separately previous to the last carding operation, and then subjecting the fibers to a final carding operation, substantially as described.

405,905. VEHICLE ATTACHMENT. DAVID M. PARRY and THOMAS H. PARRY, Indianapolis, Ind. Filed Feb. 16, 1889. Serial No. 300,360. (No model.)



Claim.—1. In a vehicle, the combination, with the shaft and axle, of a shaft-clip having upwardly-extended arms to embrace the shaft, and having the outwardly-projected headed arm D at its upper end, and a link having an eye to embrace said headed arm, substantially as shown and described.

2. In combination, the axle B, with detents c^4, the clips c^4, having projections to enter said detents, arms to embrace the shaft and flanges to embrace the axle, and having an outward headed projection D at the upper end of its inner arm, and the spring-supporting link or shackle pivotally supported by said arm, substantially as shown and described.



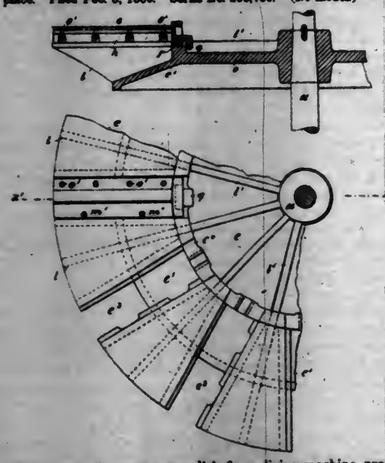
3. In a vehicle, the axle-clip having a spring-supporting link or shackle pivotally connected to its upper end, and having axle-embracing flanges at its lower end, and projections c^4 to enter detents in the axle, in combination with the axle B, having detents, as described, a strap or brace-rod, and a rearwardly-projecting step secured to the clip by bolts below the axle, substantially as shown and described.

405,906. ELECTRIC-ARC LAMP. HENRI PIEPER, Flis, Liege, Belgium. Filed Feb. 4, 1888. Serial No. 298,627. (No model.) Patented in Belgium Feb. 5, 1888, No. 80,508.

Claim.—In an electric lamp, the combination of the carbon-holders P and Q, pulleys pivoted to the said holders, the motor C, having the pulley *a* and fly-pinion F, the motor C', having the pulley *b* and fly-pinion F', spring R, chain *c*, a shunt-circuit branched off from the main circuit, the electro-magnets H and H', the armature E, having

405,906.

the catches N and N', and springs S S', carrying the armature, substantially as set forth.



405,907. WOOD-PRESERVING COMPOUND. JOSEPH W. PUTNAM, New Orleans, La. Filed May 13, 1889. Serial No. 310,629. (No specimens.)

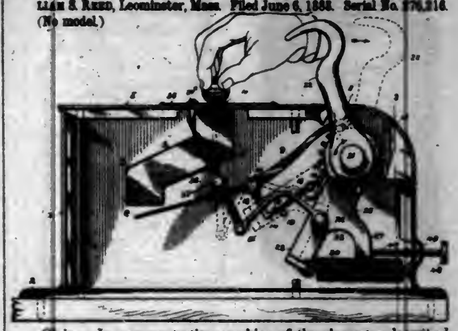
Claim.—A wood-preserving compound containing rosin, petroleum, and pine-wood oil, substantially as described.

405,908. WOOD-PRESERVING COMPOUND. JOSEPH W. PUTNAM, New Orleans, La. Filed May 13, 1889. Serial No. 310,630. (No specimens.)

Claim.—A wood-preserving compound containing rosin, creosote, and pine-wood oil, substantially as described.

405,909. SUGAR-CANE-SLICING MACHINE. CARL RABE, Sangerhäuser, Prussia, Germany, assignor to the Sangerhäuser Actien-Maschinen-Fabrik and Eisengiesserei, vormals Hornung & Rabe, same place. Filed Feb. 5, 1889. Serial No. 298,769. (No model.)

Claim.—1. A rotary cutter-disk for a slicing-machine, provided with a cutter and an inclined peripheral portion located below the cutter and receiving the severed slices therefrom, substantially as described.



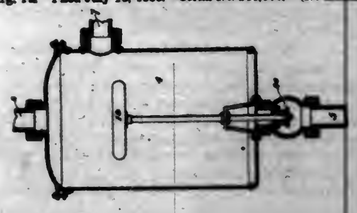
2. A rotary cutter-disk for a slicing-machine, comprising an upper horizontal peripheral portion and a lower inclined peripheral portion having radial ribs carrying the cutters and supporting the upper horizontal peripheral portion, substantially as described.

3. In a slicing-machine, a cutter-disk having an inclined peripheral lower portion and a horizontal upper peripheral portion supported by ribs on the said inclined portion and divided by radial openings c^3, intersecting the periphery of the said upper portion, substantially as and for the purpose specified.

4. In a slicing-machine, the combination, with a cutter-disk having its periphery intersected by radial openings, of a cutter-box laterally open on one side and a cutter carried by the cutter-box, substantially as and for the purpose specified.

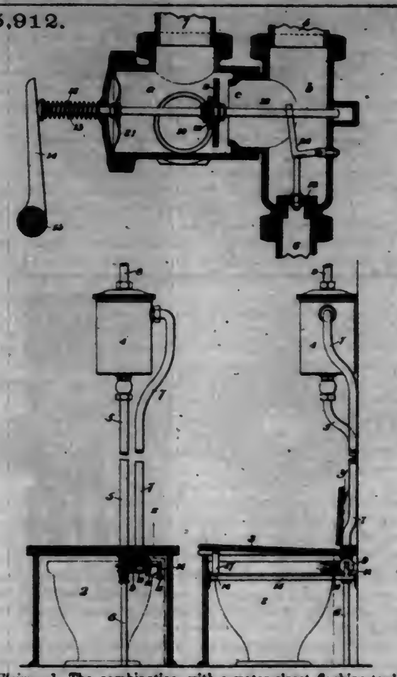
5. In a slicing-machine, the combination, with a cutter-disk having its periphery intersected by radial openings c^3 and provided with dovetailed grooves in its annular re-enforcing rib c^4, of the cutter-box *h*, open at its outer end and provided with the downwardly-projecting dovetail *r* and the hook-like tail-piece *q*, and a cutter carried by the cutter-box, substantially as and for the purpose specified.

405,910. COIN-CONTROLLED POWER-TESTING MACHINE. WILLIAM S. REED, Leominster, Mass. Filed June 6, 1888. Serial No. 276,216. (No model.)



Claim.—In a power-testing machine of the character described, the combination, with an oscillatory power-testing handle, of a coin-operated mechanism controlling the movement of said power-testing handle and comprising a pawl and ratchet-wheel normally locking the said power-testing handle against movement in one direction, and so constructed as to permit the free movement of said testing-handle in the other direction; a fulcrumed pawl-lever 9, controlling the action of the locking-pawl and arranged to release the latter from the ratchet when tripped by the weight of a coin, a lever 15, normally in such position as to limit the movement of the pawl-lever when the latter is tripped by the weight of the coin, a pawl-dog carried by said lever 15 and arranged to slide in both directions over the ratchet and to displace the normal limiting position of the lever at the moment of rotation of the ratchet in a direction similar to that in which the locking-pawl permits said ratchet to rotate.

405,911. GAS-GENERATOR. WILLIAM RENNYSON, Norristown, Pa. Filed Jan. 30, 1888. Serial No. 262,406. (No model.)



Claim.—The combination of a horizontal retort A, provided with the vertical transverse passages B, extending entirely through the retort, the said passages being for the passage of the products of combustion from the furnace, the deflectors or concentrators on the interior of the retort arranged intermediate the said passages, and a steam and hydrocarbon injector projecting into one end of the retort, whereby the gas-producing materials are projected forcibly against the front wall of each successive passage on their way through the retort, substantially as herein set forth.

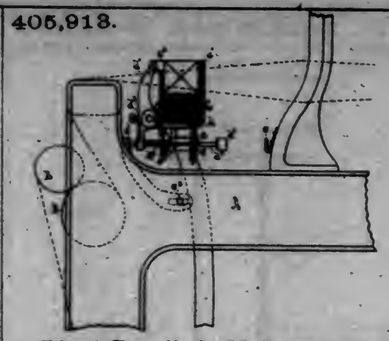
405,912. FLUSHING APPARATUS. JAMES J. RICKETTS, Pittsburg, Pa. Filed July 16, 1888. Serial No. 280,077. (No model.)

405,912.

Claim.—1. The combination, with a water-closet flushing-tank, of a combined vent and overflow pipe leading from the tank to the closet, and a vent-pipe leading from the tank, substantially as and for the purposes described.

2. The combination, with a water-closet bowl and its flushing-tank, of a valve-shell and valve, a main supply-pipe leading to the valve, a tank supply-pipe leading from the valve to the flushing-tank, and a combined overflow and vent pipe which connects the flushing-tank with the valve-chamber in advance or on the opposite side of said valve and is in free communication with the bowl, substantially as and for the purposes described.

3. The combination, with a water-closet bowl and its flushing-tank closed at the top, of a valve-shell, a main supply-pipe leading to the valve-shell, a tank supply-pipe leading from the valve-shell to the flushing-tank, a branch leading from the valve-shell to the bowl, valve mechanism adapted to simultaneously close the main and open the branch pipe, a ventilating-pipe leading from the closed flushing-tank, and an overflow-pipe leading from the flushing-tank to the valve-shell and in free communication with the bowl, substantially as and for the purposes described.



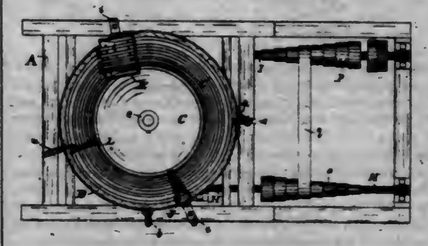
4. The combination, with a bowl and its supply-tank, of an interposed triple-ported T-valve shell, a supply-pipe leading from one port thereof to the supply-tank, and two valves which control the ports of the main pipe and the port leading to the bowl, the valve of the main pipe arranged to seat against the end of the said pipe, whereby it is held on its seat by the return-flow from the tank and its supply-pipe, substantially as and for the purposes described.

5. The combination, with a bowl and its supply-tank, of an interposed triple-ported T-valve shell, a supply-pipe leading from one port thereof to the supply-tank, and two valves which control the ports of the main pipe and the port leading to the bowl, the valve of the main pipe arranged to seat against the end of the said pipe, whereby it is held on its seat by the return-flow from the tank and its supply-pipe, and valves for closing two of said ports connected by stems, substantially as and for the purposes described.

6. The combination, with a water-closet bowl and its flushing-tank, of a supply-pipe leading to the flushing-tank, a branch therefrom leading to the bowl, valve mechanism adapted to simultaneously open the main and close the branch pipe, said branch-pipe valve having perforation therein for the escape of water to the bowl, and an overflow-pipe leading from the flushing-tank to the bowl, substantially as and for the purposes described.

405,913. SHUTTLE CHECKING AND RELIEVING MECHANISM FOR LOOMS. ORREN A. SAWYER and MOSES M. LABUE, Lowell, Mass. Filed Mar. 26, 1889. Serial No. 304,667. (No model.)

405,913.

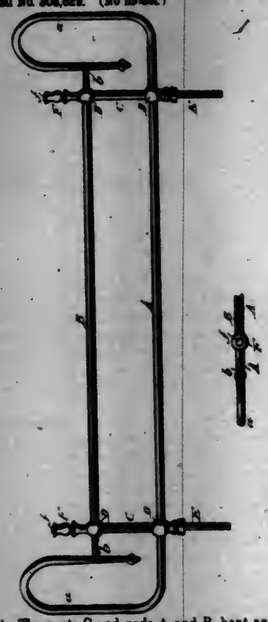


Claim.—1. The combination of the lay-beam C, arranged to move to and fro, the shuttle-box mounted thereon, having the shuttle-binder c^2 pivoted upon one side thereof, the finger d' and rod d^3, mounted upon the lay-beam, stops *b b'*, attached to the frame and arranged to be alternately brought in contact with said rod at each end of its path, and a compressing-clamp adapted to hold them in position against the shuttle-binder when moved to the same by one of said stops, substantially as described.

2. The combination of the lay-beam C, arranged to move to and fro, the shuttle-box mounted thereon, having the shuttle-binder c^2 pivoted upon one side thereof, the finger d' and its rod d^3, mounted upon the lay-beam, stops *o o'*, attached to the same and arranged to be alternately brought into contact therewith at each end of its path, and the compressing semi-cinders *e e'*, arranged to grip said rod and hold it in the position to which it is moved, substantially as described.

3. The combination of the lay-beam C, arranged to move to and fro, the shuttle-box mounted thereon and provided with the shuttle-binder c^2, pivoted upon one side thereof, the finger d' and its rod d^3, mounted upon the lay-beam, stops *o o'*, attached to the frame and arranged to be alternately brought into contact with said rod at each end of its path, the compressing semi-cylinders *e e'*, arranged to grip said rod, and a spring e^3, arranged to compress them upon the rod, substantially as described.

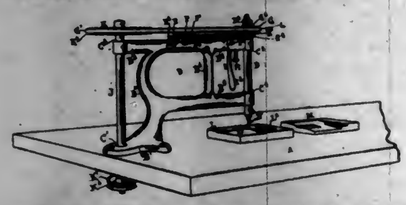
4. The combination of the lay-beam C, arranged to move to and fro, the shuttle-box mounted thereon, having the shuttle-binder c^2 pivoted upon one side thereof, the finger d' and its rod d^3, mounted upon the lay-beam, stops *o o'*, attached to the frame and arranged to be alternately brought into contact with the rod at each end of its path, a compression clamp adapted to hold said rod in the position to which it is moved, and the spring d^7, carried by said rod and arranged to press said finger against the shuttle-binder, substantially as described.



405,914. WIRE-SOLDER MACHINE. FREDERICK W. SCHULTZ, Baltimore, Md. Filed May 9, 1889. Serial No. 310,130. (No model.)

Claim.—1. A wire-solder machine having, in combination, a wheel C to revolve in a horizontal plane, and having a depending rim *f*, which forms on the lower side an open central cavity *g*, and provided with a horizontal annular plate C', a stationary water-receptacle B, having the bottom, a circular inside wall *c'*, which takes up into the said open central cavity of the wheel and forms an open center *c* and an outside wall *d*, and a vertical shaft D, extending up through the said open center of the water-receptacle and supporting the wheel C and annular plate C', whereby the revolving annular plate sets down the stationary water-receptacle.

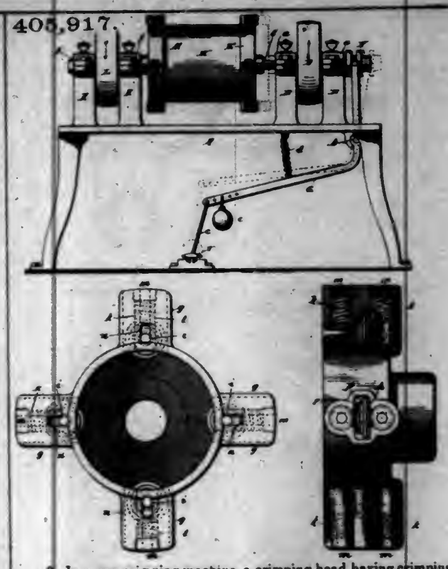
2. A wire-solder machine having, in combination, the frame, a horizontal annular plate provided with concentric grooves of various sizes, a vertical shaft D, supporting said plate, and a tapered roller J, having grooves of various sizes spaced apart to correspond with the said concentric grooves.



405,915. DASH-RAIL FOR VEHICLES. AARON SEARLS, Newark, N. J., assignor to the Searls-Randall Company, same place. Filed Apr. 9, 1889. Serial No. 306,629. (No model.)

Claim.—1. The posts O and rods A and B, bent and joined to form a double rail and handle *a*, as and for the purpose set forth.

2. The posts O and rods A and B, in combination with holder F, as and for the purpose set forth.



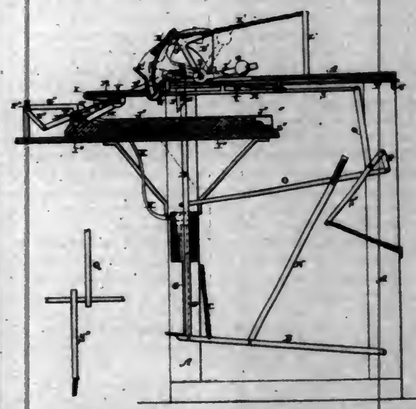
405,916. ROUTING-MACHINE. DELOS A. SEARS, Rockford, Ill. Filed June 19, 1888. Serial No. 277,608. (No model.)

Claim.—1. In combination, a suitable machine-frame, a vertical shaft mounted in bearings in said frame and capable of endwise motion and adjustment, the adjusting-springs secured to said frame and connected with said shaft in such a manner as to press the same downward, and a lever-cam mounted in said frame engaging with said springs, and adapted to raise and lower them and the shaft connected with the same, substantially as described, and for the purpose specified.

2. In a routing-machine, the combination, with a frame B, of a vertical shaft D, mounted in bearings in said frame and being capable of endwise motion and adjustment, the adjusting-springs E E', secured to the frame B and connected with the shaft D in such a manner as to press it downward, a lever-cam I, mounted in said frame engaging with the springs E E', and adapted to raise and lower the same and the shaft D, the set-screw H, for regulating the said springs and the parts supported by the same, and suitable accessory mechanism for operating said machine, substantially as set forth.

405,917. CAN-CRIMPING MACHINE. ALEXANDER SLAYMAN, Jr., Baltimore, Md., assignor of one-half to John S. Hull, same place. Filed Apr. 5, 1889. Serial No. 306,056. (No model.)

Claim.—1. In a can-crimping machine, the combination of two revolubie crimping-heads connected to revolve in opposite directions, one of said heads being constructed to reciprocate in its bearings, substantially as described.



2. In a can-crimping machine, a crimping-head supporting crimping-wheels provided with springs inclosed in the head for regulating the pressure of the wheels upon the can, substantially as described.

3. In a can-crimping machine, a crimping-head having crimping-wheels supported in elongated bearings, in combination with a spring and a screw-plug for adjusting the tension of the spring, substantially as described.

4. In a can-crimping machine, a can-crimping head having crimping-wheels within the head provided with a bead, a groove, and an inclined surface on the side of the groove opposite the bead, in combination with automatic tension devices inclosed in the head for regulating the pressure of the wheels upon a can, substantially as described.

5. In a can-crimping machine, a crimping-head having a recess to receive the end of a can, and a series of crimping-wheels supported in radial arms on the head and projecting through the walls into said recess, in combination with a tension device inclosed in each of said arms for regulating the pressure of the wheels upon the can, substantially as described.

405,918. CIGAR-BUNCHING MACHINE. FREDRICK C. SMALSTIG, Allegheny, Pa. Filed Jan. 12, 1889. Serial No. 296,185. (No model.)

Claim.—1. In a cigar-bunching machine, the combination of the spring-actuated treadle, an air-forcing mechanism connected thereto, a movable mold, a table for supporting the mold, and an operating mechanism for moving the mold forward, whereby each pocket of the mold is cleansed before the bunch is deposited therein, substantially as shown.

2. The combination of the spring-actuated treadle, a piston-rod connected thereto, an oscillating valved cylinder, a tube extending therefrom, a movable mold, and a mechanism for moving it and carrying the outer end of said tube, substantially as described.

3. The combination of the spring-actuated treadle, an air-forcing mechanism connected thereto, and a tube or pipe for conducting the air therefrom, with the carriage and its mechanism, a dog connected to the carriage and provided with an opening through which the air is forced by the tube into the pockets of the mold, and the movable mold, which is moved forward by the dog, substantially as set forth.

4. The combination of the movable mold, a ratchet connected therewith, a dog for engaging with the ratchet and moving the mold, the reciprocating carriage, to which the dog is connected, and a cover for the mold, substantially as specified.

5. The combination of a movable mold, a ratchet connected thereto, a dog for feeding the mold forward, the reciprocating carriage, to which the dog is secured, and a cover which extends over both ratchet and mold and protects the ratchet from the pawl, substantially as shown.

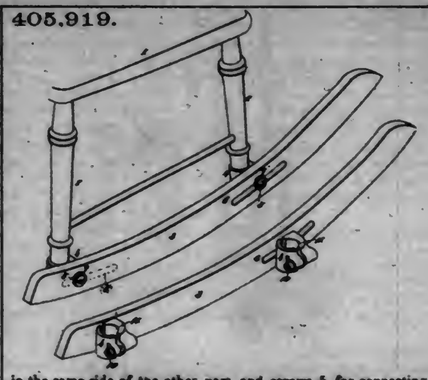
6. The combination of the reciprocating carriage, the apron, and the tapering formation-roller, with the two tapering compensators X Y, placed upon opposite sides of the roller, substantially as described.

7. The combination of the reciprocating carriage having pivoted arms connected thereto, a vertically-moving receiver journaled in the arms, a stationary rack, and a pinion on the journal of the receiver for causing the receiver to partially revolve, a reciprocating plunger or discharger in the receiver for forcing out the bunch, a hammer and its operating mechanism for striking the discharger, and a movable mold operated by a dog on the carriage for receiving the bunch from the receiver, substantially as set forth.

8. The combination of the reciprocating carriage, pivoted arms connected thereto, a partially-revolving receiver pivoted in the arms, a pinion secured to the receiver, a stationary rack engaging the pinion, a bent rod carried by one of the pivoted arms for raising the receiver, and a stationary cam-surface against which the bent rod engages, substantially as specified.

9. The combination of the partially-revolving receiver, a pinion secured thereto, an adjustable stop, pivoted arms attached to the carriage, a stationary rack, a bent rod for raising the receiver, and a cam for the bent rod to strike against, substantially as shown.

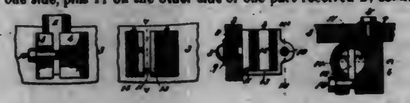
10. The combination of the reciprocating carriage, pivoted arms connected thereto, a partially-revolving receiver journaled in the arms, a pinion on the end of the receiver, a stationary rack, a bent rod for raising the receiver, a cam-surface against which the bent rod strikes, a plunger placed in the receiver, a hammer for operating the plunger, the shaft to which the hammer is secured, the arm E", the rod D", and the crank which is operated in one direction by the spring K' and in the other by the treadle, substantially as described.



11. The combination of a reciprocating carriage, a vertically-moving and partially-revolving receiver, means for causing the receiver to partially revolve, a plunger placed in the receiver, a hammer for operating the plunger, and a movable mold operated by the movement of the carriage, substantially as set forth.

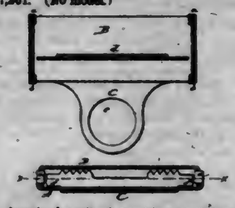
12. The combination of the treadle mechanism, the cranked shaft, the cleanser connected to and operated thereby, a retracting-spring, the pivoted conductor, a spring-actuated dog for operating the conductor, and a stop for operating the dog, substantially as described.

13. The combination of the treadle, the slotted operating-rod D, the shaft Z, provided with a crank, a latch for engaging with the projection on the rod D, a stop for operating the latch, the conductor, the cleanser, the spring-actuated dog for operating the conductor, and the retracting-spring K', substantially as set forth.



14. The combination of the shaft Z, provided with a crank, and a treadle-operating mechanism, with the conductor provided with a projection G', the cleanser secured to the shaft, the spring-actuated dog D', provided with the shoulders E' F', and the retracting-spring, substantially as specified.

405,919. CHAIR ATTACHMENT. AARON STRAUS and MAX B JACOBY, St. Louis, Mo.; said Jacoby assignor to said Straus. Filed Nov. 2, 1888. Serial No. 289,805. (No model.)



Claim.—1. In an attachment for chairs, the combination of the clips, consisting of two parts each fixed to one side of each rocker, connecting bolts or screws for securing the clips to the rockers, one part of each clip being substantially fixed and the other part adjustable, the latter having guide-pins on one side and the former having sockets to receive the pins, and a fastening securing the outer edges of the parts together, substantially as set forth.

2. In an attachment for chairs, the clips consisting each of two parts having bottom flanges 13, set-screws 10, connecting said parts on one side, pins 11 on the other side of one part received by sockets in the same side of the other part, and screws 5, for connecting the clips to the rockers, substantially as and for the purpose set forth.

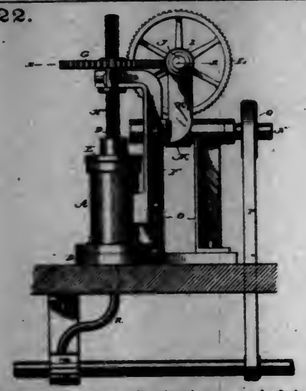
405,920. BUCKLE. DWIGHT L. SMITH, Waterbury, Conn., assignor to the Waterbury Buckle Company, same place. Filed Apr. 15, 1889. Serial No. 307,261. (No model.)

Claim.—The herein-described buckle, consisting of the plate A, its ends turned at right angles and constructed with ears *a a b b*, a second plate B, corresponding to the plate A, its ends turned upward into U shape, the ears on the plate A turned into the U-shaped ends of the plate B, one of said plates constructed with the slot *d*, combined with a lever, the jaw of which rests between said plates and which extends through the slot *d*, substantially as described.

405,921. INK-WELL. ALBERTS R. SPRAGUE, Racine, Wis. Filed Mar. 14, 1889. Serial No. 303,295. (No model.)

Claim.—1. In combination with a desk having an ink-well, a flat spring-arm E, pivoted to the desk, and a cover secured to the arm, all substantially as shown, the arm being adapted to swing laterally with reference to the ink-well and to exert a downward pressure thereon.

2. In combination with a desk provided with an ink-well B, a laterally-swinging cover C, adapted to fit upon the top of the ink-well, and a flat spring E, secured at one end to the cover and at the opposite end to the desk and adapted to exert a downward pressure upon the cover.

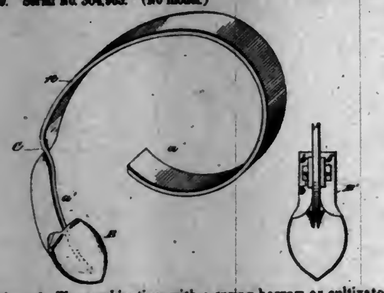


3. In combination with a desk provided with an ink-well, a laterally-swinging cover C and a flat spring E, secured at one end to the desk and pivotally connected at its other end with the cover, substantially as shown.

4. In combination with a desk provided with an ink-well having its upper surface below the top of the desk, and provided also with a recess *c*, a spring E, seated in said recess, and a cap or cover C, pivotally connected with the free end of said spring, all substantially as shown.

405,922. OILER. JOHN F. W. STAIRS, Halifax, Nova Scotia, Canada. Filed Dec. 14, 1888. Serial No. 293,052. (No model.)

Claim.—1. The cylinder provided with the detachable head, the piston having the grooved rod threaded through said head, in combination with the wheel through which the rod slides and by which it is turned, and the rigid wheel-sustaining arm overhanging the cyl



405,922.

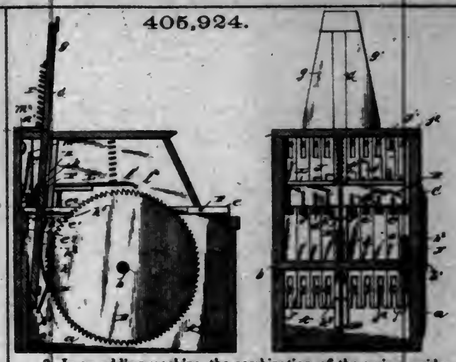
inder at a distance therefrom, whereby the removal of the cylinder-head and the withdrawal of the piston are permitted without disturbance of the wheel or its support.

2. In a lubricator, the stationary cylinder and its piston having the grooved and threaded rod, in combination with the arm overhanging the cylinder, the wheel G, journaled in said arm and encircling and engaging the piston-rod, the shaft J, with its worm and worm-wheel, and the shaft N, with its worm and driving-pulley.

405,923. SPRING HARROW-TOOTH. ABRAM W. STEVENS, LE ROY W. STEVENS, WARREN M. BRINKERHOFF, and LESTER D. SWART, Auburn, N. Y., assignors to A. W. Stevens & Son, same place. Filed Mar. 27, 1889. Serial No. 304,963. (No model.)

Claim.—1. The combination, with a spring harrow or cultivator tooth, having at its lower end a portion with a narrower face to the line of draft than the main body of the same, of an earth-engaging point or blade, having at its rear portions extending inwardly from an edge of the blade and secured to the narrower portion of the tooth, substantially as described.

2. The combination, with a spring harrow or cultivator tooth, having at its lower end a portion edgewise to the line of draft, of an earth-engaging point or blade having at the rear bent portions extending inwardly from an edge of the blade and secured to the edgewise portion of the tooth, substantially as described.



3. The combination, with the main portion of a spring harrow or cultivator tooth, having at its lower end a portion edgewise to the line of draft, of an earth-engaging blade or point having at its rear portions extending inwardly from an edge of the blade, and secured to the edgewise portion of the tooth by a non-adjustable connection, substantially as described.

4. An earth-engaging point or blade for a harrow-tooth, having a broad flat lower extremity, and having a V-shaped portion the forwardly-projecting apex of which extends downwardly and vanishes in the upper part of the broader portion, substantially as described.

405,924. ADDING-MACHINE. JAMES C. STINSON, Paris, Tex., assignor of one-third to Joseph K. Bywaters, same place. Filed July 10, 1888. Serial No. 279,691. (No model.)

Claim.—1. In an adding-machine, the combination of a series of keys pivoted upon a common bearing, a number of stops, and means for separately adjusting each stop to regulate the stroke of the keys, an upright, and guides secured to the casing, in which the said upright moves, a universal bar secured to the upright and resting upon the shanks of the keys, a ratchet-wheel, and a spring-pawl secured to the upright and engaging the teeth on the ratchet-wheel to operate the same, substantially as described.

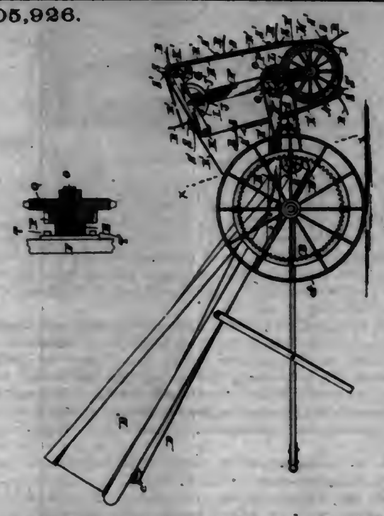
405,924.

2. In an adding-machine, the combination of the casing, guides secured thereto, an upright working in the guides, a universal bar secured to the upright, a number of keys pivoted within the casing, upon the shanks of which the universal bar rests, a ratchet-wheel, and a spring-pawl secured to the upright, the lower end of which spring-pawl is provided with a longitudinal slot through which a portion of the periphery of the ratchet-wheel moves, substantially as and for the purpose specified.

3. In an adding-machine, the combination of the casing, guides secured thereto, an upright working in the guides, a universal bar secured to the upright, a number of keys pivoted within the casing, upon the shanks of which the universal bar rests, a ratchet-wheel, and a spring-pawl secured to the upright, the lower end of which spring is provided with a longitudinal slot through which a portion of the periphery of the ratchet-wheel moves, and a spring secured to the upright and the casing to cause the universal bar to resume its normal position after being operated by the keys, substantially as and for the purpose specified.

4. In an adding-machine, the combination of the casing, a series of keys pivoted upon a common bearing within the same, an upright and guides secured to the casing, in which the upright moves, a universal bar secured to the upright and resting upon the shanks of the keys, and arms secured to the said shanks, the upper ends of which arms are provided with hooks to engage the universal bar, substantially as and for the purpose specified.

405,925. NECKTIE-FASTENER. CHARLES E. STUBBS, Fairfield, Iowa. Filed Sept. 11, 1888. Serial No. 285,163. (No model.)



Claim.—1. A fastening device consisting of a metallic plate having the shoulder *c* and a central spring-section separated by slits from said plate at its side edges and integral therewith at its ends, said section having an opening near one end, and the side edges of said plate being struck up at about their centers, a lever having a central opening and a handle or thumb-piece, and a tongue projecting therefrom at opposite sides or edges and at right angles to each other, said lever being adapted to be inserted in or passed through the slits formed in the plate, with its body portion above the spring section, substantially as described.

2. The combination, in a necktie-fastener, of the metallic plate having perforations round its edges, a central spring portion separated from said plates at its sides, said central portion having an opening at one end and teeth or prongs formed at one end of said opening, and a lever pivotally mounted between the spring-section and the plate-sides, said lever being formed of a single piece of metal having an oblong or elliptical central opening, a curved handle or thumb-piece projecting from the upper edge of said lever, and a tongue projecting from the opposite edge of and at right angles to said lever, whereby the strap of the necktie may be inserted in the oblong opening and clamped between the tongue and the teeth or prongs, substantially as described.

405,926. HAY GATHERER AND ELEVATOR. DAVID B. TAPPAN, Bellefontaine, Ohio. Filed Mar. 12, 1888. Serial No. 267,046. (No model.)

Claim.—1. The combination, in a hay-loader, of a frame pivoted at the rear thereof upon a horizontal axis to oscillate freely, a hay-gatherer mechanism carried by said frame, the preponderance of weight thereof being below the pivot of the frame, driving mechanism consisting of wheels or pinions mounted coincidently to the axis of the said pivoted frame, and intermediate devices connecting

405,926.

one of said wheels or pinions with one of the supporting-wheels and the other with the gatherer mechanism.

2. The combination, with a hay-loader having rearwardly-extending supports, of a frame pivoted thereon on trunnions, so as to oscillate, a roller and a shaft having pulleys, both supported by the upper end of said frame in different vertical planes, a shaft supported by said frame below the trunnions and having pulleys, endless belts carried by said roller and pulleys, gatherer-teeth and stripping and discharging fingers carried by said belts, the former at about a right angle to the belts and the latter normally lengthwise with the belts, whereby the fingers are moved at their free ends in the direction of the length of the teeth by the bends of the belts as they travel over the roller, and driving mechanism connecting one of said shafts with one of the supporting-wheels of the loader.

3. The combination, in a hay-loader, of a frame pivoted at the rear thereof upon a horizontal axis, so as to oscillate freely, hay-gatherer mechanism carried by said frame, the preponderance of the weight thereof being below the pivot of the frame, and driving-gearing, the prime pinion of which has its axis of rotation coincident to the axis of the frame, whereby upon a lock of the gearing, occasioned by an obstruction to the teeth, the driving-power is transferred to elevate the teeth.

4. The combination, in a hay-loader having rearwardly-extending supports, of a frame carried by said supports and upon trunnions and free to oscillate, a roller and shafts having pulleys carried by said frame, the roller and one of the shafts by the upper end and the other shaft by the lower end, endless belts carried by said roller and shafts, gatherer-teeth and stripping and discharging fingers carried by said belts, the former at about a right angle to the belts and the latter normally lengthwise to the belts, whereby the fingers are moved lengthwise of the teeth at their free ends by the bends in the belts as they go over the roller, a gear-wheel mounted on one of said shafts, a meshing-pinion and a sprocket-pinion mounted on one of said trunnions, and a sprocket-chain on the latter pinion driven by a gear rim and pinion actuated by one of the supporting-wheels.

5. In a hay-loader, the combination, with the rearwardly-extending supports, of a frame mounted therein upon trunnions and free to rock on said trunnions, a roller, and a shaft having pulleys carried by the upper ends of said frame, a shaft having pulleys carried by the lower ends of said frame, belts carrying teeth, and stripping and discharging fingers mounted upon said belts, the preponderance of the weight of the lower shaft, its pulleys, and the lower end of the frame being below the trunnions.

6. The combination, in a hay-loader having rearwardly-extending supports and a frame mounted thereon to rock freely upon trunnions, of a roller, and shafts having pulleys carried by said frame, belts carrying teeth and stripping and discharging fingers, said devices being arranged with the preponderance of weight below the trunnions, a gear-wheel on the lower of said shafts, and a driving-pinion on one of said trunnions, whereby the roller and pulleys are rotated, and whereby, when the teeth are obstructed and the revolution of the gear-wheel and belts is stopped, the power applied to them is transferred, through the pinion and gear-wheel, to the lower end of the frame to move it upward and rearward on the trunnions.

7. In a hay-loader, the combination, with the rearwardly-extending supports, of a frame mounted thereon and upon trunnions and consisting of side bars, a cross-bar pivoted to the upper end of each side bar, a roller mounted in one end of the cross-bars, and a shaft carrying pulleys mounted in the other end, and a shaft mounted in the lower ends of said side bars and carrying larger pulleys, belts fitted to said rollers and pulleys, teeth projecting at about right angles to said belts, and stripping and discharging fingers lying along and secured at one end on said belts, the other and free ends of the fingers being adjacent to the teeth, whereby as the fixed ends of the fingers pass over the roller and the angle of the belts is changed the fingers are actuated away from the teeth.

8. The combination, with the frame of a hay-loader, of a gatherer-frame consisting of side bars, cross-bars pivoted thereto at one end and having segments and fastening devices to lock them in different positions, a roller, and a shaft having pulleys mounted in said cross-bars, a shaft having pulleys mounted in said side bars, and belts carried by said roller and pulleys and having teeth and stripping and discharging fingers.

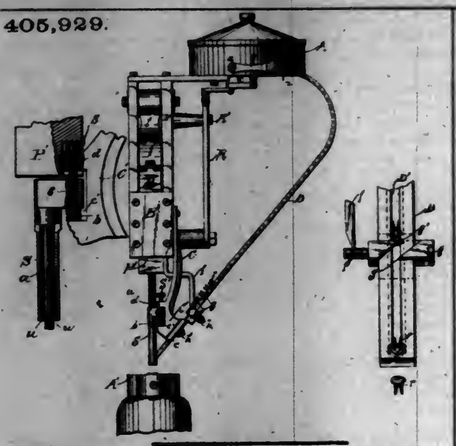
9. The combination, with a hay-gatherer belt, of teeth carried thereby, and stripping and discharging fingers lying along and lengthwise the belts and secured to a bar, which is fastened to the belt by an inclined rivet, so that the tension of the belts tends to draw the free ends of the fingers toward the belts.

405,927. CHECKREIN-HOOK. JAMES S. TAYLOR, Wichita, Kans. Filed Mar. 16, 1889. Serial No. 303,471. (No model.)

Claim.—In a check-hook, the combination, with the base portion, curved as shown and formed with upwardly-extended lug *g*, of the combined lever-arm and hook, pivoted to the upper end of said base portion, the hook being curved to correspond with the curvature of the base portion and fitting against the inner side thereof, and the arm formed with a downwardly-extended lug adapted to engage said lug on the base portion, substantially as shown and described.

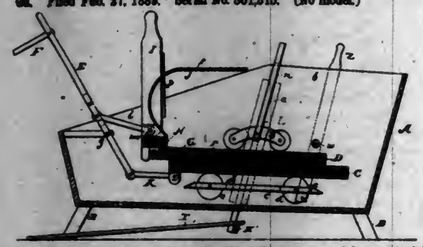
405,928. RUBBER BUCKET FOR CHAIN-PUMPS. MORRIS D. TEMPLE, Chicago, Ill. Filed May 2, 1887. Serial No. 236,776. (No model.)

Claim.—1. In an expansion rubber bucket for chain-pumps, the combination, with the screw-bolt and the expansion nut or washer, of a rubber having a narrow upper portion encircling the bolt and having a lower portion of greater diameter than the upper portion, and having an open cavity the diameter of which is at all points less than the diameter of the nut and is gradually diminished from top to bottom when the nut is in position at the top of the cavity, substantially as described.



2. In an expansion rubber bucket for chain-pumps, the combination, with a screw-bolt and the expansion nut or washer, of a rubber having a narrow upper portion encircling the bolt and having a lower portion of greater diameter than the upper portion, and having an open cavity the surrounding wall of which is of increased thickness from top to bottom of the cavity, the diameter of said cavity being gradually and continuously diminished from top to bottom, substantially as described.

405,929. RIVETING-MACHINE. JACOB J. UEBELHOR, Syracuse, N. Y., assignor to Judson L. Thomson & Co., same place. Filed June 3, 1887. Serial No. 240,586. (No model.)



Claim.—1. In a rivet-inserting machine, the combination, with the reciprocating plunger and a hollow barrel-like rivet-guide always surrounding said plunger and having its lower end split and formed with internal shoulders, of an offset on the hollow guide, a headed screw in said offset, a supporting-bracket through which the screw slides, and a spiral spring to return the guide to position after the descending plunger has pressed it down and forced the rivet out of its split end, substantially as and for the purpose set forth.

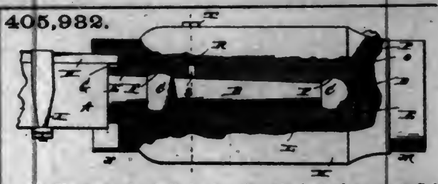
2. The upright B', bracket C C', having cut-out *c'*, and shoulder *d*, the screw S', passing through said shoulder and through lug *s* on valve S, the discharge-valve S, and spiral *b*, substantially as and for the purpose set forth.

405,929.

405,930. WASHING-MACHINE. MARTIN B. WALLACE, Dalton, Ga. Filed Feb. 27, 1889. Serial No. 301,315. (No model.)

Claim.—A washing-machine having the upper and lower reciprocating wash-boards connected by pitmen to an operating-lever, the side spring and its under beveled projection extending through the side wall, the pressure-bar, its side arms engaging slideways of the side walls of the body of the machine, and having extensions extending downward inside of said body and carrying the double-roller bearings pivoted to their lower ends, substantially as specified.

405,931. SPRING-HINGE. GEORGE W. WARNER, Freeport, Ill. Filed Nov. 20, 1888. Serial No. 291,353. (No model.)



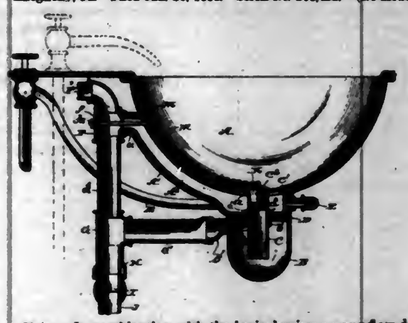
Claim.—1. The spring-hinge comprising two leaves hinged together at their ends, a hollow tube or barrel secured to one of said leaves, a spring located within said barrel, and a movable yoke pivoted to the other of said leaves and adapted to compress said spring within the barrel when the leaves are first moved from their closed or outstretched position.

2. The spring-hinge comprising the leaves A A', pivoted together at a^3, the hollow barrel C, secured to the leaf A' and provided with longitudinal slots c', the spring D, located within said barrel, the yoke E, pivoted at $e\,e$ to the movable leaf A and adapted to move within said slots c' to engage said spring D, substantially as described.

405,932. VEHICLE HUB AND AXLE. ISAAC M. WARNER, Bethel, Mich. Filed Feb. 7, 1888. Serial No. 263,967. (No model.)

Claim.—1. The combination of the axle having the spindle and the tree with its end projecting over the shoulder of the inner ends of the spindle, with the wheel having the box bearing on the spindle, and having the annular recess at its inner end, into which the projecting end of the tree extends, and the sand-band at the inner end of the hub extending over the projecting end of the tree, substantially as specified.

405,932.



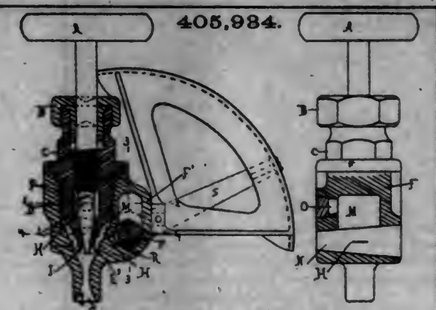
2. The tapered spindle having the spherical enlargements C, in combination with the box having the tapered bore adapted to engage the spindle and provided with countersunk recesses corresponding in form to the enlargements C, said box being formed of longitudinally-separable sections, the hub, and the transverse screw P, entering through and engaging aligned openings in the hub and in the separable sections of the axle-box, whereby the latter is held firmly in the hub, substantially as described.

3. The combination of the spindle having enlargements formed thereon, the longitudinally-divided axle-box having recesses to accommodate said enlargements, the hub secured upon the axle-box by means of a screw passing through said hub and through outer ends of the parts or sections of which said axle-box is composed, and a lubricating-tube extending transversely through one side of the hub and registering with a perforation in the axle-box, substantially as set forth.

4. The combination of the spindle having enlargements formed thereon, the longitudinally-divided axle-box having recesses to accommodate said enlargements, the non-perforate hub made solid at its outer end and having a recess in its inner end to receive the axle-box, and a fastening-screw passing transversely through one side of the hub and through the sections composing the axle-box, which are thereby secured in the recess of the hub, substantially as set forth.

5. The combination of the spindle having enlargements formed thereon, the longitudinally-divided axle-box having recesses to accommodate said enlargements, the non-perforate hub made solid at its outer end and having a recess in its inner end to receive the axle-box, a fastening-screw passing transversely through one side of the hub and through the sections composing the axle-box, which are thereby secured in the recess of the hub, and a lubricating-tube extending through one side of the hub and registering with a perforation in the axle-box, substantially as set forth.

405,933. COMBINED SUPPLY, OVERFLOW, AND WASTE FITTINGS FOR SLOP-SINKS, BASINS, AND BATHS. FRANK A. WELLS, Allegheny, Pa. Filed Jan. 30, 1888. Serial No. 261,432. (No model.)



Claim.—In combination with the basin having an overflow-duct formed integrally with it and communicating with the outlet of the basin, a cup having an eduction-orifice communicating with the waste-pipe, and a tubular plug which opens at its upper end in the basin and at its lower end in the cup, and which penetrates the top of the cup and the bottom of the overflow-duct and forms a sealed passage through such duct from the basin into the cup, the supply-pipe connected into the integral overflow-duct, the T F connected to the upper end of said duct, the tubular parts G' and G^2 connected, respectively, with the T F and the nipple B' of the cup B, and the T G, connecting said tubes G' and G^2, and having its third mouth leading to the waste-pipe, substantially as set forth.

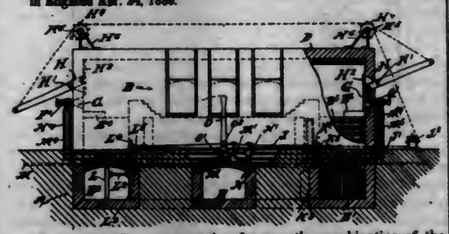
405,934. FLUID-FEEDER. WALTER B. WRIGHT, Chicago, Ill., assignor to Williams & Wright, same place. Filed Oct. 16, 1888. Serial No. 288,542. (No model.) Patented in England Apr. 24, 1889.

Claim.—1. In an injector fluid-fuel feeder, the combination of an oil-supply reservoir, with a nozzle containing a plug-valve cavity, having an aperture leading to said reservoir on one side and a discharge-aperture leading to the injector proper on the other side, and

405,934.

a plug seated within said cavity and provided with a spiral groove upon its surface for regulating the supply of fluid to the discharge-aperture.

2. In an injector fluid-fuel feeder, the combination of an oil-supply reservoir, with a nozzle containing a plug-valve cavity, having an aperture leading to said reservoir on one side and a discharge-aperture leading to the injector proper on the other side, a plug seated within said cavity and provided with a spiral groove upon its surface for regulating the supply of fluid to the discharge-aperture, a handle for such plug, and a graduated quadrant over which such handle passes, whereby the effective area of the fluid-passage way may be correctly indicated.

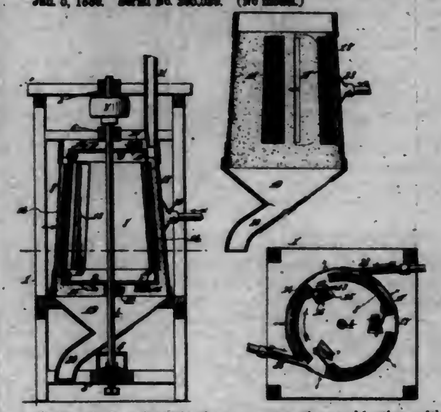


405,935. BRICK-KILN. WALTER B. WRIGHT, Chicago, Ill., assignor to the International Gas and Fuel Company, same place. Filed Feb. 6, 1889. Serial No. 298,813. (No model.)

Claim.—1. The combination of a kiln with an auxiliary furnace, pipes for supplying a drying-fluid, which said pipes pass through such furnace and open into the kiln, and pipes for supplying fluid fuel, which open directly into the kiln, and which also open into such auxiliary furnace and thus heat the fluid passing therethrough.

2. The combination of a kiln with fluid-fuel pipes leading thereto, an auxiliary furnace, drying-fluid pipes which pass through such furnace, a burner-nozzle which opens from such fluid-fuel pipe into the furnace, and a series of compound valves with discharge-nozzles about such kiln and connected both with the fluid-fuel pipes and the drying-fluid pipes, so as to serve either as discharge-nozzles for the drying-fluid or burner-nozzles for the fluid fuel.

405,936. REGENERATIVE FURNACE. WALTER B. WRIGHT, Chicago, Ill., assignor to the International Gas and Fuel Company, same place. Filed Mar. 7, 1889. Serial No. 302,378. (No model.) Patented in England Apr. 24, 1889.



Claim.—1. In a regenerative furnace, the combination of the hearth with a chamber on each side thereof containing regenerating checker-work through which the air may pass into the furnace, a series of apertures above such checker-work through which the fluid fuel passes, and sliding protector-plates in front of such apertures, as shown, adapted to cover the same when fluid fuel is not being discharged therethrough, as and for the purpose described.

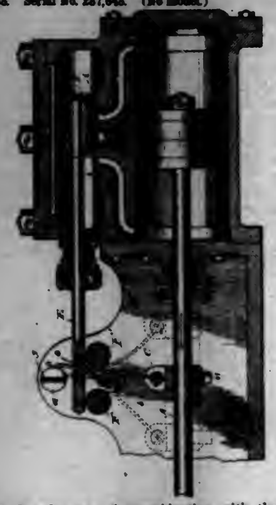
2. In a regenerative furnace, the combination of the hearth with air and fluid-fuel passages or pipes which open therein at opposite sides thereof and a fluid-fuel-supply reservoir connected therewith, and valves in the several connections, a lever operatively connected with and controlling all of such valves, and protector-plates in front of such apertures connected with such lever.

3. In a regenerative furnace, a steam-supply pipe having a three-way valve therein and branches therefrom leading to the opposite ends of the furnace, a fluid-fuel-supply pipe having a three-way valve and pipes leading therefrom through the opposite ends of the furnace, discharge-valves or burners into which said pipes open, and apertures opening into the furnace at the opposite ends through which such valves project, air-supply passages opening into the space beneath the regenerating checker-work of the furnace, and valves therein which alternately connect such passages with the open air and with the flue, a lever operatively connected with and controlling all of such valves, and protector-plates in front of said fluid-fuel discharge valves or burners, the same suspended and connected with said operating-lever.

405,937. GRAIN-SCOURER. WILSON AGER, Bloomsburg, Pa. Filed Jan. 5, 1889. Serial No. 295,599. (No model.)

Claim.—1. In a decorticating apparatus, the combination, with an outer drum and an inner revolving cylinder, both provided with suitable abrading-surfaces, of air-blast conductors entering the wall of the outer drum for delivering air-currents in a direction opposite to the revolution of the inner cylinder, substantially at a tangent to said cylinder, substantially as described.

2. In a decorticating apparatus, the combination, with an outer drum and an inner revolving cylinder, both provided with abrading-surfaces, of means for inducing an air-current within the cylinder, which is provided with openings in its cylindrical wall, and air-blast conductors entering the wall of the outer drum in a direction substantially tangential to the cylinder and opposite to the direction of its revolution, substantially as described.



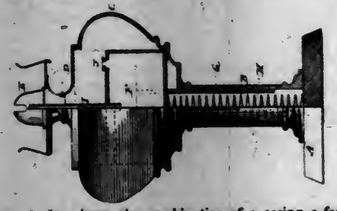
3. In a grain-decorticating apparatus, the combination, with an outer drum having an inner imperforate abrading-surface provided at intervals with foraminous openings, of an inner revolving cylinder having blast-openings in its walls, and provided with means for inducing an air-current within the cylinder, and air-blast conductors passing through the outer drum for delivering air-blasts in a direction substantially tangential to the cylinder and opposite to its direction of revolution, substantially as described.

4. In a grain-decorticating apparatus, the combination, with an outer drum having an inner abrading-surface provided with foraminous openings at intervals, of an inner revolving cylinder having blast-openings in its wall and provided at its ends with hooded air-forcing openings, and air-blast conductors entering the outer drum in a direction contrary to the direction of revolution of the inner cylinder, substantially as described.

405,938. MANUFACTURE OF A NEW ALPHA-NAPHTHOL-DISULPHONIC ACID. MOSES ANDRESEN, Berlin, Germany, assignor to the Action-Gesellschaft für Anilin Fabrikation, same place. Filed Apr. 27, 1888. Serial No. 272,047. (Specimens.) Patented in Germany Mar. 16, 1888, No. 45,776; in England Mar. 26, 1888, No. 4,625, and in France Mar. 31, 1888, No. 189,712.

Claim.—The new alpha-naphthol-disulphonic acid obtained by first forming naphthalene-disulphonic acid by treating naphthalene with sulphuric acid and monochlorhydrin, or with fuming sulphuric acid, then treating the naphthalene-disulphonic acid so formed with nitric acid, reducing the resulting alpha-nitronaphthalene-disulphonic acid to alpha-amidonaphthalene-disulphonic acid, separating and converting into the corresponding alpha-naphthol-disulphonic acid, substantially as described.

405,939. VALVE-GEAR. JOHN T. ARNOLD, Hyde Park, Ill. Filed Oct. 9, 1888. Serial No. 287,648. (No model.)



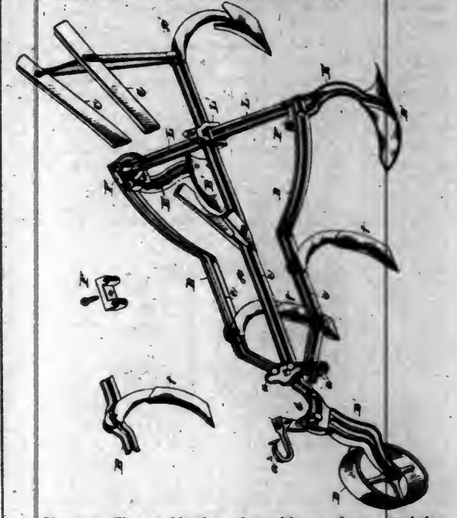
Claim.—1. In valve-gear, the combination, with the piston-rod and valve-rod, of a spring-arm having one end pivotally connected to the piston-rod and its opposite end projecting into the path of and engaging the valve-rod and the fixed stops, substantially as described.

2. In valve-gear, the combination, with the piston-rod and valve-rod, of a spring-arm having one end pivotally secured to the piston-rod and the other end projected through a slot in the valve-rod and the fixed stops, substantially as described.

3. In valve-gear, the combination, with the piston-rod having a head-block, a spring-arm pivotally secured thereto and projected through a slotted valve-rod, and the stops F, F', and G, substantially as described.

405,940. LAMP. RICHARD T. BARTON, New Haven, Conn., assignor of one-half to Michael Sonnenberg, same place. Filed Dec. 14, 1888. Serial No. 293,620. (No model.)

Claim.—1. In a lamp, the combination of a casing, a fount arranged within said casing for vertical movement, a spring upon which said fount rests, a burner stationary above the fount, and a wick-tube stationary in the burner and extending downward through a corresponding opening in the top of the fount and so as to fit loosely therein, thereby serving as a guide for the vertical movement of the fount, substantially as described.



2. The combination, in a lamp, of a tubular standard, a casing upon the upper end of said standard open at its top, a cap adapted to close the said opening in the casing, a burner upon said cap, a fount arranged within said casing, with a downward projection from its bottom into said tubular standard as a guide for the vertical movement of the fount, and a spring within said standard upon which said fount rests, substantially as described, and whereby said fount is automatically adjustable with relation to the burner and the oil in the fount.

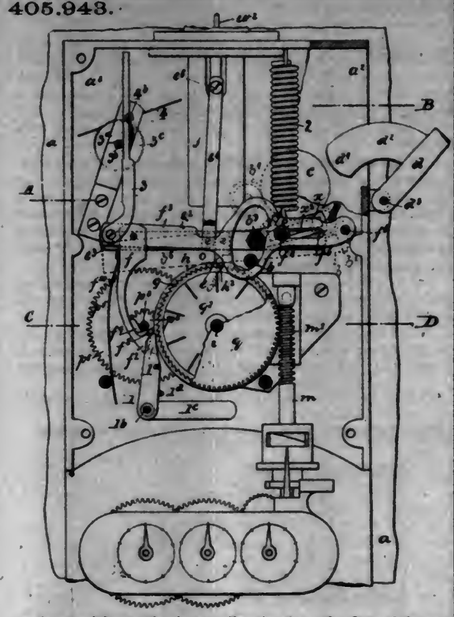
405,941. HORSE-TAIL HOLDER. ROBERT L. BEYS, Brunswick, N. Y. Filed June 27, 1888. Renewed May 20, 1889. Serial No. 312,054. (No model.)

Claim.—In a horse-tail holder, the combination, with the strap S, threaded through a buckle-eye and folded back on itself for connection and for attachment to the buckle-eye, of the prongs P, made with heads *h* and downturned ends *e*, with the prongs passed through said strap S, and having their heads secured between the latter and the connected strap part S^3, substantially as shown and described.

405,942. CULTIVATOR. WARREN M. BRINKERHOFF, Auburn, N.Y. Filed Mar. 23, 1889. Serial No. 304,403. (No model.)

Claim.—1. The combination of a cultivator-frame consisting of corrugated metallic bars having vertically-curved portions, and standards provided with curved portions adapted to engage the curved corrugated portions of said frame, and attaching-bolts, substantially as described.

2. A cultivator-frame and a perforated block F, in combination with a blade-supporting arm having a laterally-projecting flange at its upper end provided with a series of openings and an L-shaped securing-bolt, substantially as described.



3. The within-described reversible blade curved throughout its length, having an inclined end and a curved end merging into the lower edge of the blade, said curved end being connected to the upper edge by a short straight edge at an angle to the upper edge, substantially as described.

4. The within-described reversible blade curved throughout its length, having an inclined end and a curved end, the latter being merged into the lower edge of the blade, the upper edge having an upper curve and such curved edge connected with the curved end by a short straight edge, substantially as described.

5. The combination, with a cultivator-bar and a blade-arm having a laterally-projecting flange at its upper end provided with a series of openings, of the devices for securing said arm to the said bar, consisting of a block, a bolt pivotally securing said arm to the block, and an L-shaped bolt, polygonal in cross-section, fitting a like opening in said block, and having a projection for engaging the openings in the lateral flange of the blade-arm, substantially as described.

405,943. APPARATUS FOR VENDING GAS. ROWLAND W. BROWNHILL, Aston New Town, Birmingham, County of Warwick, England. Filed June 12, 1888. Serial No. 276,846. (No model.) Patented in England May 13, 1887, No. 7,012; in France Mar. 5, 1888, No. 176,142, and Mar. 8, 1888, No. 176,230, and in Germany Mar. 12, 1888, Nos. 22,737 and 22,738, and Mar. 20, 1888, No. 23,262.

Claim.—1. The combination, with a gas-supply pipe, a valve therein, and a meter, of a vending apparatus comprising a train of gearing adapted to receive motion from the flow of gas through said meter and in connection with said valve, and a series of levers one of which carries a pawl and constructed and arranged to give backward motion to said gearing, according to the amount of movement of said levers, and a fixed bearing between which and the free end of one of said levers a coin may be pushed to communicate motion to the levers, all being constructed, arranged, and adapted to operate substantially as described.

2. The combination, with a gas-supply pipe, a valve therein, and a meter, of a vending apparatus comprising a train of gearing adapted to receive motion from the flow of gas through said meter and in connection with said valve, and a series of levers one of which carries a pawl and constructed and arranged to give backward motion to said gearing, according to the amount of movement of said levers, and a fixed bearing between which and the free end of one of said levers a coin may be pushed to communicate motion to the levers, all being constructed, arranged, and adapted to operate substantially as described.

3. The combination of a meter, a gas-supply pipe, a valve therein, and coin-released vending mechanism comprising a train of gearing connected to and adapted to govern the opening and closing of said valve and constructed and arranged, substantially as described, so as to open said valve for a length of time dependent upon the coin by means of which said mechanism is brought into action, substantially as described.

4. The combination of the meter, a gas-supply pipe, a valve therein, and vending mechanism comprising a train of gearing and appurtenant parts located between the meter and valve and constructed and arranged substantially as described, and connected to said meter and valve, as set forth, so as to allow the meter to act and to open the valve for a determined length of time dependent upon a coin of certain size being pushed into the governing mechanism, as set forth.

5. The combination, with a meter and vending mechanism comprising a train of gearing connected with and receiving motion from the meter, and mechanism consisting of a lever and detent for releasing said train of gearing upon the insertion of a coin, of a valve connected to said gearing and interposed in a gas-supply pipe, substantially as described.

6. The combination of a gas-supply pipe, a valve therein, and a vending apparatus comprising a rod carrying a detent and connected to said valve, a disk mounted on an arbor and having a notch to receive said detent, a ratchet-wheel on said arbor, a pawl engaging with said ratchet-wheel, a pivoted lever carrying said pawl, a fixed bearing in proximity to the free end of said lever, a meter connected to said arbor, and a clutch arranged upon said arbor, all constructed and arranged substantially as described, whereby, when a coin is pressed through between said fixed bearing and said lever, the detent is thrown out of engagement with the notched lever, turned back, and then released and moved forward until the detent again engages with the notch, as set forth.

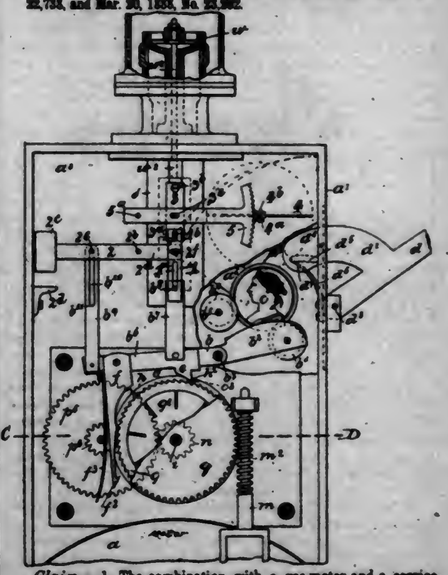
7. The combination, with a meter, gas-vending mechanism connected therewith through the medium of a clutch and comprising a train of gearing, a gas-valve receiving motion from said mechanism, and levers and pawls constructed and adapted to alternately engage with and release a ratchet-wheel arranged in said train of gearing, of a fly and intermediate gearing connecting the same with said levers, substantially as described.

8. The combination, with a coin-lever *b* and main lever f^3, of a slotted arm $x\,x^2$ and the pin or stud f^4, whereby the said main lever is worked on a coin being forcibly pressed home, as set forth.

9. The combination, with a coin-lever *b* and main lever f^3 and penny and shilling disks h *o*, provided with notches h^3 o^3, of a lever c^2, having tooth *c*, as set forth.

10. The combination, with the main lever f^3, pivotally connected at its inner end to a fixed support, a swiveled pawl $f\,f^2$, and a ratchet-wheel *g*, of disk *h*, receiving motion from a gas-meter and communicating motion to a valve arranged in a gas-supply pipe, as set forth.

11. The combination, with the pawls $f\,f^2\,f^3$ and ratchet-wheel *g*, of a lever $1\,1^a\,1^b$, joined at 1^b, as set forth.



12. The combination, with the clutch g^2 and meter-driving wheel *q*, of a penny-disk *h*, having a notch h^3, intermediate gearing between said driving-wheel and disk *h*, and a gas-valve receiving motion from said measuring-wheel, as set forth.

13. In a gas-vending apparatus, the combination, with a casing containing gas-vending mechanism and provided with a coin-slit a^2, of lever fulcrumed at d^2 and carrying a pusher-arm d^5, the upper part of the lever being normally located over the coin-slit a^2, as set forth.

14. In a gas-vending apparatus, the combination of a lever carrying an arm d^3, to which is attached rack d^9, having incline d^{10}, and spring-pawl d^4, adapted to engage with said rack when the arm is moved in one direction and to pass under the same on the return movement for preventing the return of the lever until the coin has been fully pushed home, substantially as set forth.

15. The combination, with the delivery mechanism and its main lever f^3, of rack-bar 3, attached to said lever, gearing 3^a 3^b 4^b, and fly receiving motion from said lever and gearing, substantially as described.

405,944. APPARATUS FOR VENDING GAS. ROWLAND W. BROWNHILL, Aston New Town, Birmingham, County of Warwick, England. Filed June 20, 1888. Serial No. 278,065. (No model.) Patented in England May 13, 1887, No. 7,012; in France Mar. 5, 1888, No. 176,142, and Mar. 8, 1888, No. 176,230, and in Germany Mar. 12, 1888, Nos. 22,737 and 22,738, and Mar. 20, 1888, No. 23,262.

Claim.—1. The combination, with a gas-meter and a service-pipe containing a valve, of vending mechanism connected with said meter and valve and comprising releasing devices operated by the forcing inward and releasing of a coin, substantially as described and set forth.

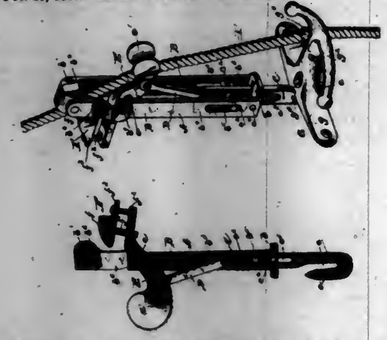
2. The combination, with a gas-supply pipe, of vending mechanism provided with a detent normally holding the said mechanism from operation, and adapted to be released by the insertion of a coin within the apparatus, as described and set forth.

3. The combination, with a coin-lever b b' b^2 b^4, pivoted at b^2, and having a tooth or catch c, of disks A o, having notches A^3 o^3, as set forth.

4. The combination, with mechanism for controlling the gas delivery and registration, of the coin-operated lever b, provided with the roller b', and having the tooth c engaging with the wheels h o, substantially as set forth.

5. In a gas-vending apparatus, the combination, with the gearing-train receiving motion from the meter-drum and the valve w, of the forked upright b^7, slides 1 and 3, weighted lever 2, lever b b^2 b^4, and arm b^3, substantially as described.

6. In a gas-vending apparatus comprising mechanism for insuring the delivery of a measured quantity of gas and a coin-operated lever by which said mechanism is restrained and released, the combination, with said lever, of the lever d, provided with a coin-pusher d^3, substantially as described.



7. In a gas-vending apparatus, the combination of the coin-pushing-home arm or lever d d^3, carrying a rack d^4, the spring-pawl d^6 d^7, and the pawl located upon the fixed framing and adapted for preventing the lever from being withdrawn until the coin has been fully pushed home, thus preventing fraud, as set forth.

8. The combination, with the valve w w^2 and its casing and coin-lever b, with tooth c, and pawl f, of slides, arms, and levers b^7, 1, 2, 3, and b^3, and their cognate parts, as set forth.

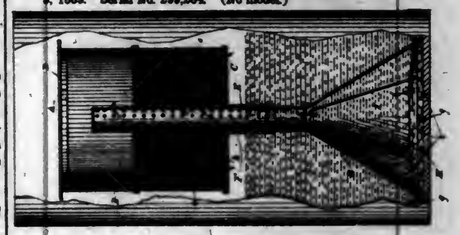
9. The combination, with the meter-wheel q and clutch q^3, of the penny and shilling disks A o, provided, respectively, with the notches A^3 o^3, as set forth.

10. The combination, with the penny and shilling disks A o, provided, respectively, with notches A^3 o^3, of transmitting and reduction gear n and the attendant transmitting and reduction gear and cognate parts i i^2 i^3 i^4 i^5 p' p^2 p^3 p^4 p^5 p^6 n o^3, as set forth.

405,945. FIRE-ESCAPE. William Bruce, Wellsville, N. Y. Filed Feb. 23, 1889. Serial No. 300,869. (No model.)

Claim.—1. In a fire-escape, the combination of the frame having the head-block grooved in its lower side and forming the top of a rope-brake, the brake-shoe grooved in its upper side and attached to the rear arm of a double-armed lever pivoted to and between the side bars of the main frame, the link-rod pivoted at its upper end to the front arm of said lever, and the hooked bar pivoted to the lower end of the link-rod, sliding longitudinally in the frame and adapted to be attached to a proper support for a person's body, substantially as specified.

2. In a fire-escape, the combination of the longitudinal frame having the head-block forming the upper part of a rope-brake, the latch-bar pivoted to the head-block and notched on its edge near its lower end to engage a pin on the shorter side bar of the said frame, the double-armed lever pivoted to and between the side bars of the frame and operated by means substantially as described, and the brake-shoe connected to the rear arm of said lever and forming the lower part of the rope-brake, as specified.



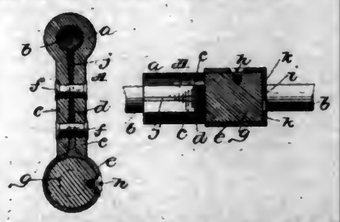
3. In a fire-escape, the combination, with the frame B, having the perforated base-plate, the side bars b^3 b^4, and the head-block b', provided with the rope-groove b^5, and the pivoted latch-bar b^6, of the bar C, having the hook on its lower end for the attachment of a support, with its journals sliding in the slots b^3 of the frame B and provided with the slot c^3, straddling the bar c^4 of the frame B, the link-rod D, the double-armed lever E, pivoted in the frame B and having the end of its front arm enlarged and provided with the notch e', the adjustable brake-shoe F, provided with the rope-groove f, and the screws f' f^2, by means of which the brake-shoe is adjusted and set on the rear arm of the said lever E, substantially as specified.

4. In a fire-escape, the combination, with the upper longitudinal section comprising the rope-brake, the brake-operating lever and link, and the sliding bar C, having the hook c on its lower end, of the lower transverse section provided with the hand-bar having the septum to engage the hook c between its arms, and the strap engaged by snap-hooks at its end to openings in the ends of the hand-bar, substantially as specified.

5. The herein-described fire-escape composed of the upper longitudinal section comprising the frame, the rope-brake, the link and lever, and the bar C, having the hook c on its lower end, the lower transverse section comprising the hand-bar g, the shank g', the curved bar g^2, projection g^4, and the septum g^5, and the strap H, provided at its ends with snap-hooks h to engage openings in the ends of the hand-bar, substantially as specified.

6. In a fire-escape, the combination of the upper longitudinal section comprising the rope-brake, the brake-operating lever and link, and the sliding bar having a hook on its lower end, the turn-button Z, and the lower detachable transverse section provided with the hand-bar having the septum adapted to engage the hook below the turn-button and provided with a detachable strap, substantially as specified.

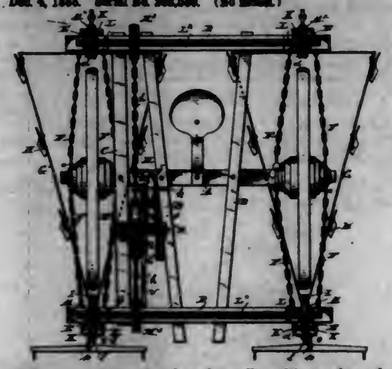
405,946. COFFEE-BOILER. Paul Bulow, Cain, Kans. Filed Feb. 9, 1889. Serial No. 299,284. (No model.)



Claim.—1. The combination, with the cup having a cover and perforated sides, of a tube entering the body of the cup and adjustable therein, said tube being partially perforated, and the conical base supporting the lower end of the tube, and the cone secured within said base and opening into the tube, substantially as and for the purpose specified.

2. The combination of the boiler with a cup therein having a cover and perforated sides and an opening in its bottom surrounded by a depending sleeve, an adjustable tube having a perforated end extending through said sleeve and entering the cup, and a conical base supporting said tube, and a cone secured within said base and open at its upper end below the tube, all substantially as described.

3. The combination of the cup A, consisting of top ring B and bottom b, connected by legs c, a perforated ring C, and the cover D, with the adjustable tube supporting said cup and perforated, as described, the conical base supporting said tube, and the cone within said base, all substantially as set forth.



4. The herein-described utensil, consisting of a perforated tube F, a conical base G, having feet g, supporting said tube, a cone I, supported in said base by stays i, with the cup A, formed of a top ring B, a lower perforated ring C, a bottom b, having a central opening, a sleeve E, surrounding said opening and through which the upper end of tube F passes, and the cover D thereof, all substantially as and for the purpose described.

405,947. LOOM-PICKER. Patrick H. Connor, Amesbury, Mass. Filed Aug. 24, 1888. Serial No. 283,618. (No model.)

Claim.—A loom-picker having tube c, fin d, and the perforated end k, formed of metal as an integral casting, the tube c and cheeks e, formed from one piece of green hide or other suitable non-metallic material, said cheeks terminating at the junction of fin d and tube c and secured to said fin by rivets, and a suitable packing g, inserted in tube c and abutted against end k, all substantially as specified.

405,948. CULTIVATOR. James Cossum, Greenfield, Mass. Filed Dec. 4, 1888. Serial No. 292,580. (No model.)

Claim.—1. A triangular-shaped metallic cultivator-frame having teeth arranged upon its sides and the acute angle, and provided front and rear with irons I, terminating in hooks l, by which the said frame may be lifted from the ground, as set forth.

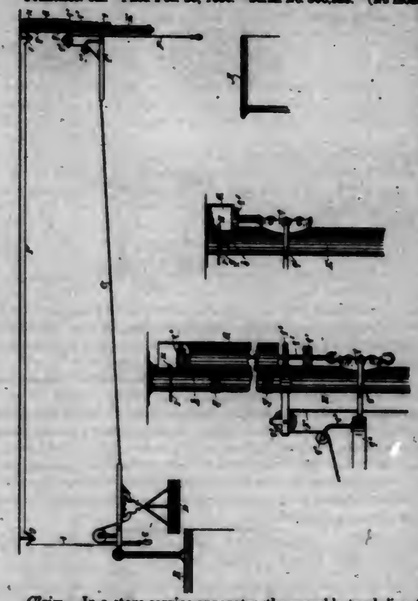
2. The cultivator-frame G, bars I secured thereto, provided with hooks l and anti-friction wheels K, in combination with the vehicle-frame, slotted legs E secured thereto, the pulley Q', ratchet Q, pulleys M^2 M^3 on shafts L' L^2, the chains A, secured to pulleys M^2 and pulley Q', pulley M M' on shafts L' L^2, the lever S, and spring-bolt T, whereby the cultivators may be lifted from the ground and so held, as and for the purpose specified.

3. The combination, with a cultivator-vehicle axle, plates or washers c and clips b secured thereto, of chains F, secured between the vehicle-axle and the slotted legs, and connected forward by links to the singletree, as and for the purpose set forth.

405,949. POT LID OR COVER. Elizabeth G. Copelin, Washington, D. C. Filed Dec. 10, 1888. Serial No. 294,061. (No model.)

Claim.—As a new article of manufacture, the pot lid or cover made of glass and having the rim edge or flange 2 and the metallic rim-band 3, bent around the said rim-flange, the said metallic rim-band being split and having its ends overlapped, as at 4, and being thereby adapted to conform to the expansion and contraction of the glass cover or lid, substantially as described.

405,950. BILLIARD-CUE-TIP FASTENER. Alexander H. Darrow, Chicago, Ill. Filed Mar. 12, 1888. Serial No. 302,950. (No model.)

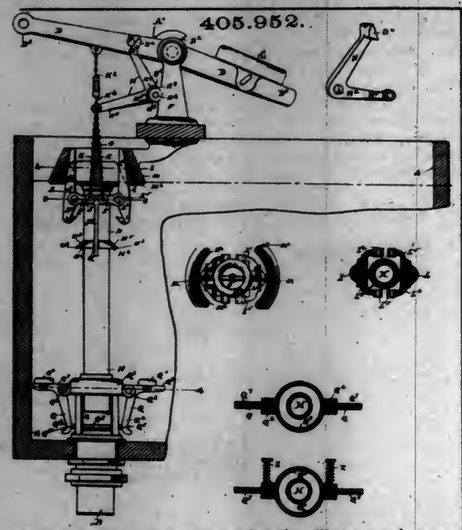


Claim.—1. In a device for use in securing the tips on billiard-cues, the combination of a block provided with a socket to receive the reduced end of a cue, a spring within the socket compressed by the insertion of the cue, and a clamp to hold the cue against the resilience of the spring, comprising a lever having a cam p at one end and fulcrumed upon the block, substantially as and for the purpose set forth.

2. In a device for use in securing the tips on billiard-cues, the combination of a block A, provided with a slotted socket A^3 to receive the reduced end of a cue, a spring C, confined within the socket and having a head c, and a clamp B, comprising a lever having a cam p at one end and fulcrumed upon the block, substantially as described.

3. A device for securing the tips on billiard-cues, comprising, in combination, a block A, provided with a slotted socket A^3 to receive the reduced end of a cue, a spring C, confined within the socket and having a head c, ears A^2 at opposite sides of the slot in the socket, a clamp B, comprising a lever having a cam p at one end pivotally supported between the ears A^2, and faced with rubber p', and an eye l in the block, at which to suspend the device, substantially as described.

405,951. STORE-SERVICE APPARATUS. Perry L. Davis, San Francisco, Cal. Filed Feb. 23, 1889. Serial No. 300,893. (No model.)



Claim.—In a store-service apparatus, the movable track-line, the guide-connections of said line having a spindle with a collar or flange c^2, and the elevating-cord for raising said connections and line, in combination with the rod or support for the track-line connections and upon which they move up and down, the sleeve G, secured to said rod or support and in which the spindle, with its collar or flange, moves, the spring-controlled catch H in said sleeve, and adapted to engage and hold the collar or flange c^2, so as to keep the track-line elevated, and a releasing cord or line connected with said catch for withdrawing it to allow the track-line to descend, substantially as described.

405,952. OPERATING MECHANISM FOR VALVES OF WATER-CLOSET AND OTHER TANKS. Patrick W. Doherty, Boston, Mass. Filed Aug. 22, 1888. Serial No. 283,471. (No model.)

Claim.—1. The combination, with a tank for liquid, an outlet-pipe for the liquid, and an opening and closing valve to the outlet-pipe, of mechanism to secure an opening of the valve and to release the valve to close, consisting of a vertical lever or levers L, adapted at their lower ends to grip the valve or part connected therewith, a yoke J movable up and down, on which said levers L, intermediate of their length, are fulcrumed, a line K, suspending each of said levers L, a reciprocating operating-lever D, from which said line or lines K are suspended, and a stationary abutment M^3 for the upper end portions of levers L, substantially as described, for the purpose specified.

2. The combination, with a tank for liquid, an outlet-pipe for the liquid, and an opening and closing valve to the outlet-pipe, of mechanism to secure an opening of the valve and to release the valve to close in one portion, consisting of a vertical lever or levers L, adapted at their lower ends to grip the valve or part connected therewith, a yoke J movable up and down, and on which said levers L, intermediate of their length, are fulcrumed, a line K, suspending each of said levers L, a reciprocating operating-lever D, from which said line or lines K are suspended, and a stationary abutment M^3, for the upper end portions of levers L, and in its other portion consisting of an abutment P of said operating-lever D, an angular lever N, fulcrumed at

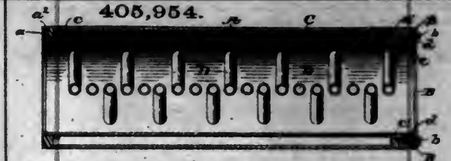
405,952.

its angle, and having on one arm a foot-piece D^4 to rest and work on said abutment P, and a line O—such as a chain, rod, &c.—connected to valve, or part connected therewith, and to arm N^2 of angular lever N, substantially as described, for the purpose specified.

3. The combination, with a tank for liquid, an outlet-pipe for the liquid, an opening and closing valve to the outlet-pipe, and mechanism adapted to secure an opening and closing of the valve, of a lever or levers Q, fulcrumed on a stationary support, and at one side of its fulcrum having a bearing on the valve, or some part connected therewith, and at the other side of its fulcrum having an applied resistant—such as a weight—whereby to exert pressure by the lever on the valve or some part connected therewith, substantially as described, for the purpose specified.

405,953. CAR-COUPLING. WARREN DORR, Gardiner, Me. Filed Oct. 4, 1888. Serial No. 287,144. (No model.)

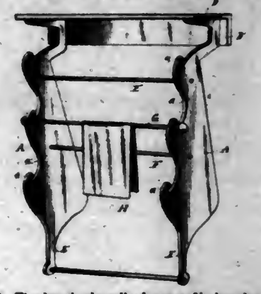
Claim.—1. In a car-coupler, a draw-head A, having a series of projecting plates with rounded ends, the upper projecting plate having an open-ended circular slot, the opening in said slot being of sufficient size to permit the coupling-pin to pass through the same, substantially as shown, and for the purpose set forth.



2. In a car-coupler, the combination of a draw-head A, having outwardly-projecting plates *b*, *b'*, and *b²*, perforations *c c* formed therein, the upper plate having an open-ended slot C, a recess *d* in the rear of said slot, and a pin-guide D, having an inclined groove within which the pin rests, the upper portion of said guide being rounded, substantially as shown, and for the purpose set forth.

3. The combination, in a car-coupler constructed substantially as shown, provided with a recess *d*, of a pin-guide having a groove the rear wall of which is inclined, the upper edge of the walls forming the groove being rounded, said pin-guide being secured to the car-body above the draw-head and rear of the perforations through which the pin passes for connecting the draw-heads, substantially as shown, and for the purpose set forth.

405,954. STEAM-GENERATOR. DANIEL DOUGHERTY, Washington, D. C. Filed Mar. 26, 1888. Serial No. 304,772. (No model.)

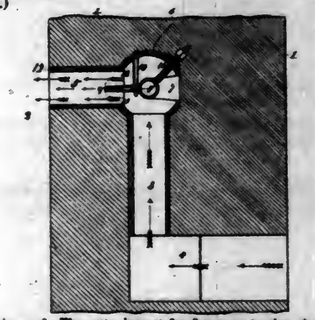


Claim.—1. A sectional boiler consisting of a shell A, provided with internal annular heads *a a'*, and packing-gland B, in combination with an interior longitudinal tube C, having collars *c c'*, as set forth.

405,954.

2. A sectional boiler consisting of a series of shells A, having internal annular heads *a a'*, and gland B, in combination with a series of interior longitudinal tubes C, having collars *c c'*, and a series of smaller tubes connecting said shells, as set forth.

405,955. BRACKET FOR PAPERS. LOUIS P. FRIEDMAN, Rochester, N. H. Filed Mar. 6, 1889. Serial No. 302,006. (No model.)



Claim.—1. The herein-described paper-file bracket, composed of side supports having corresponding supporting-arms, the edges of the supports sloping rearwardly from the said arms, and the cross-bars uniting the said supports and arranged below and a little in the rear of the supporting-arms, substantially as and for the purpose described.

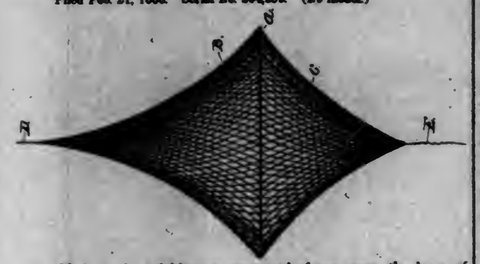
2. The combination, with the support having portions of its edge sloping rearwardly, as shown, of the yielding arms secured to the support below the sloping edge, and having their upper ends extending above and adapted to set in opposition to the said sloping edge to retain a paper-file, substantially as and for the purpose described.

3. The herein shown and described paper-file bracket, composed of side supports having right-angled heads at their upper ends and depending extensions at their lower ends, and having supporting-arms, the edge of the supports sloping opposite the said arms, and the cross-bars uniting the supports and arranged below and in the rear of the said arms, substantially as described, for the purpose set forth.

405,956. JET ATTACHMENT FOR FURNACES. MICHAEL A. FOSTER, St. Louis, Mo. Filed Feb. 26, 1889. Serial No. 301,357. (No model.)

Claim.—1. The attachment for furnaces having the induction and eduction passages 3 and 5, and a central head 6 with slot 7, adapted to receive a jet-pipe 8, having a jet 9, substantially as and for the purpose set forth.

2. The combination, with the induction and eduction passages 3 5, and the central head 6, having an opening therethrough, of a jet-pipe passing through said opening and having the jet 9, and a set-screw adapted to impinge said pipe, whereby the jet 9 may be held in the proper position, substantially as set forth.

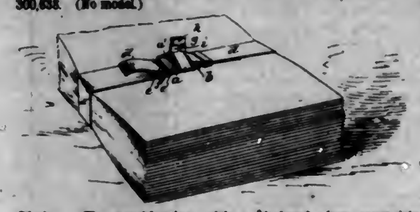


3. The attachment for furnaces having the induction and eduction passages 3 and 5, the central head 6, having the slot 7, a jet-pipe 8, projecting through said slot and having a jet 9 projecting therefrom, and the pins 10, substantially as and for the purpose set forth.

4. The combination, in an attachment for furnaces, of a device adapted to be inserted in the wall of the furnace, of an induction-passage 3 in communication with the outer air, an eduction-passage 5, discharging into the fire-chamber, a central head 6, adapted for the passage of a jet-pipe and having the slot 7, pins 10, and set-screw 11, all substantially as and for the purpose set forth.

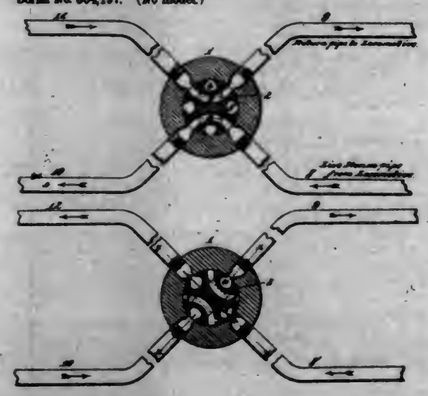
5. The attachment for furnaces having the induction-tube with passage 3, discharging into the chamber of a head 6, adapted for the passage of a jet-pipe 8 with a jet 9, and an eduction-tube 12, movable on a joint 13 and secured in position by the set-screws 14, substantially as set forth.

6. The attachment for furnaces having the induction-tube with passage 3, discharging into the chamber of a head 6, adapted for the passage of a jet-pipe 8 with jet 9, and an eduction-tube 12, movable at its base 13, for the purpose set forth.



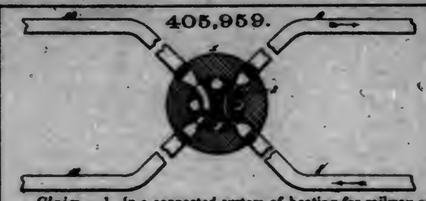
405,957. FISHING-NET. HENRY R. FRETSCHLAR, San José, Cal. Filed Feb. 21, 1888. Serial No. 264,859. (No model.)

Claim.—1. A fishing-net composed of two cones, the bases of which are united to a ring which serves as a weight and as an extender for the said bases, substantially as described.



2. The combination of inner net C, of similar shape and form with outer net B, and metallic base-ring A, the same working within and upon net B, being controlled by the cord E, attached to its center and apex and passing up inside and through center of net B.

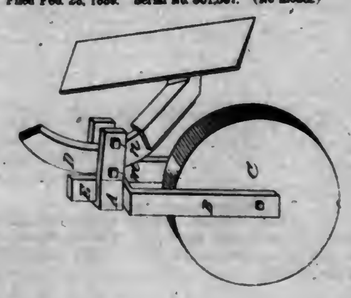
405,958. CLASP FOR FILE-BANDS. EDWARD J. HALL and HARRISON I. MORTON, Bennington, Vt. Filed Feb. 20, 1889. Serial No. 300,638. (No model.)



Claim.—The combination, with a file-band clasp comprising upper and lower frames *a a'*, adapted by their rear portions to be secured to one end of a file-band, of a lifter or handle attached to said upper frame, substantially as and for the purpose described.

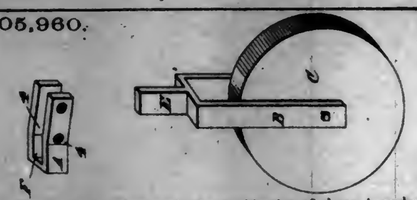
405,959. VALVE FOR THE STEAM-HEATING PIPES OF RAILWAY-CARS. ROBERT I. HAMPTON, Athens, Ga. Filed Mar. 21, 1889. Serial No. 304,197. (No model.)

405,959.



Claim.—1. In a connected system of heating for railway-cars, the combination, with a series of independent radiating-circuits each consisting of a direct and a return branch, of a valve-casing having communication therewith and also with pipe-sections communicating with the direct and return branches of the connected car, said valve-casing having a valve-core provided with two curved steamways capable of registering with all four pipe-openings simultaneously and having also two crossing steamways by which the direct and return branches may be brought into communication at the same time, substantially as described.

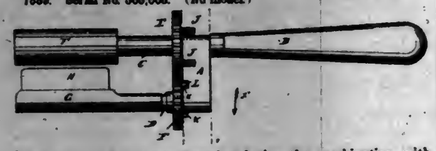
2. In a connected system of railway-heating, an independent or local radiating-circuit composed of a direct or live-steam branch and a return branch, a valve-casing at each end of the independent radiating-circuit with which said branches have communication at stated intervals, pipe-sections entering said valve-casing at like intervals and coupled to the connected independent radiating-circuit, and a cylindrical valve-core in each valve-casing having two curved steamways opening at such points that they may communicate with the connected direct and return branches, or with the local direct and return branches, and provided also with two crossing steamways, one carried over and the other below the curved steamways, and having their openings intermediate of those of the curved steamways, whereby the direct and return connected branches may be brought into communication, substantially as as described.



3. In system of steam-heating for railway-cars, the combination, with a direct and return branch, one receiving steam from and the other returning it to a source of steam-supply, of a cylindrical valve-casing with which said branches communicate at intervals of ninety degrees, a valve-core seated in said casing and having two steamways emerging at intervals of ninety degrees and provided with two crossing steam-passages, both emerging on the cylindrical face of the core half-way between the openings of the curved steamways, and two pipe sections adapted to connect with the adjacent independent radiating-circuit, said pipe-sections entering the valve-casing at intervals of ninety degrees, whereby a turn of the core may connect the direct branches, the direct and return branches of the independent circuit or of the same and a connected circuit, or cut off the steam entirely, the turn of the core being guided by an index on one part and a guide or graduate on the other part, substantially as described.

4. In a system of steam-heating for railway-cars, the combination, with a local or independent radiating-circuit composed of a direct or live-steam branch 8 and a return branch 9, of a valve-casing 1, having a valve-core 2, provided with curved steamways 3, and with crossing diametrical steam-passages 4 and 5, the curved steamways opening at intervals of ninety degrees, and the cross-passages opening between the ends of the steamways 3, and pipe-sections 10 and 12 at each end of the local radiating-circuit and entering the valve-casing 1 at intervals of ninety degrees, whereby the curved steamways 3 may be turned to connect the direct branches 8 and 10 of the connected independent circuits, or the cross-passages 4 and 5 be brought to connect the direct and return branches of the connected circuits, or one of the steamways 3 be thrown into communication with the direct and return branch of the local circuit, or the steam wholly cut off, substantially as described.

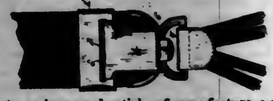
405,960. GOPHER-TRUCK. SAMUEL R. HARRY, Chatsworth, Ill. Filed Feb. 23, 1889. Serial No. 301,587. (No model.)



405,960.

Claim.—In a gopher-truck, the combination of clamp A, socket F, wheel-frame E B, and wheel C, as set forth.

405,961. RAZOR-STROPPING DEVICE. FREDERICK KAMPFE, RICHARD KAMPFE, and OTTO KAMPFE, Brooklyn, N. Y. Filed Mar. 12, 1889. Serial No. 303,003. (No model.)

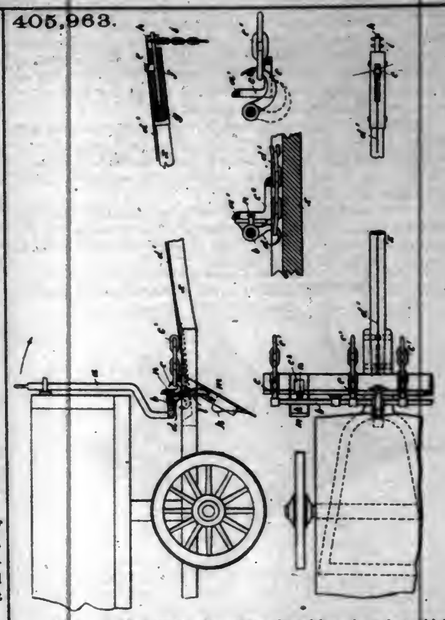


Claim.—1. In a razor-stropping device, the combination, with the blade-holder, of a spindle adjacent to the blade-holder and carrying a friction-roller, and gearing for transmitting motion from the spindle carrying the friction-roller to the blade-holder, substantially as set forth.

2. In a razor-stropping device, the combination, with a block, of two parallel spindles, one carrying a blade-holder and the other a friction-roller, gearing for transmitting motion from the spindle carrying the friction-roller to the spindle carrying the blade-holder, and check-pins on the gear-wheel on the roller-spindle, substantially as set forth.

3. In a razor-stropping device, the combination, with the block, of two parallel spindles on the same, a friction-roller on one spindle, a blade-holder on the other spindle, cog-wheels on said spindle, check-pins on the cog-wheel of the roller-spindle, pins on the cog-wheel of the blade-holder spindle, and a spring against which the pins on the cog-wheel of the blade-holder spindle can press, substantially as set forth.

405,962. SUSPENDER-BUCKLE. JOHN KENNEDY, Birmingham, assignor to the Osborne & Cheesman Company, Ansonia, Conn. Filed Mar. 22, 1889. Serial No. 304,236. (No model.)



Claim.—1. As an improved article of manufacture, a suspender-buckle comprising a frame having a swinging clamp-lever for clamping the suspender on the frame, and a pendent tubular frame having a portion bent inward to form lugs, and a suspender-end-carrying cast-off provided with a diverging spring-plate having a tang passing between the inwardly-bent lugs, and provided with shoulders to engage the lugs, substantially as described.

2. A suspender-buckle having a central depending tubular frame formed of a plate of metal having integral lateral extensions bent rearwardly and then toward each other, in combination with a clasp-plate having a spring-plate provided with a tang adapted to pass between rearwardly-turned lugs on the lower end of said tubular frame, which lugs engage square shoulders on each side of said tang, said plate carrying the suspender-end, substantially as described.

3. A suspender-buckle composed of a tubular frame having a slot in which is mounted a claw-plate provided with a depending tubular frame integral with the claw-plate, and a clasp-plate having an eye or loop carrying the suspender-ends, and provided with a diverging spring-plate having shoulders engaging inwardly-turned lugs on the tubular frame, and a tang passing between said shoulders, substantially as described.

4. The combination, with a buckle-frame 1, of a claw-plate 2, pivotally mounted thereon, and provided with a depending tubular frame 4, having lugs 5, and a clasp-plate 6, having an eye or loop 7, and a spring-plate 8, provided with a tang 9 and having shoulders 10 on each side thereof, said tang having an extremity serving as a finger-piece, substantially as described.

405,963. HORSE-DETACHER. GOTTLIEB KIRNICH, Oberesslingen, Würtemberg, Germany. Filed Mar. 6, 1888. Serial No. 302,093. (No model.) Patented in Germany Dec. 2, 1887, No. 43,834, and in England Jan. 17, 1888, No. 751.

Claim.—1. The combination of the slotted bar *a'*, against which the traces rest, with the shaft *b*, having the hitching-hooks movable in the slots of the bar to release the traces, and a lever for rotating the shaft, said slotted bar serving to support the traces while the hooks are being disengaged therefrom, substantially as described.

2. The combination of the axially-rotating shaft *b*, provided with the hand-lever *a*, and having the curved hitching-hooks *c*, and the central hook *d*, with the bar *a'*, having slots in which said hooks are movable, the spring-bar *f*, and the draw-rod *d'*, connected with the central hook on the rotating shaft, substantially as described.

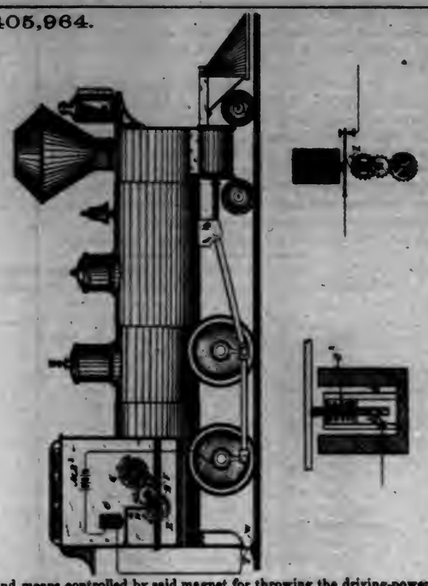
3. The combination, with the oscillating shaft *b* and hand-lever *a*, of the pins *n*, the chain *l*, brake-block *k*, and the slotted singletree-bar *a'*, substantially as and for the purpose specified.

4. The combination, with the oscillating shaft *b* and hand-lever *a*, of the pins *n*, the chain *l*, brake-block *k*, the hooks *c*, and the slotted singletree-bar *a'*, substantially as and for the purposes specified.

5. The combination, with the oscillating shaft *b* and hand-lever *a*, of the pins *n*, the chain *l*, brake-block *k*, the hooks *c*, the hook *d*, and the slotted singletree-bar *a'*, substantially as and for the purposes specified.

6. The combination, with the oscillating shaft *b* and the hand-lever *a*, of the pins *n*, the chain *l*, brake-block *k*, the hooks *c*, the hook *d*, the slotted singletree-bar *a'*, the drawing-rod *d'*, the bolt *e*, the spring *g*, and the sliding bar *f*, arranged and operating substantially as and for the purposes specified.

7. The combination, with the oscillating shaft *b* and the hand-lever *a*, of the pins *n*, the chain *l*, brake-block *k*, guide *m*, and slotted singletree-bar *a'*, substantially as and for the purpose specified.



405,964. AUTOMATIC ELECTRIC CONTROLLER FOR RAILROAD-TRAINS. FRANK R. KINSMAN, New York, N. Y. Filed Aug. 17, 1886. Renewed May 1, 1888. Again renewed Dec. 13, 1888. Serial No. 293,533. (No model.)

Claim.—1. The combination, with the controlling device for a railway-brake, of a governing electro-magnet on the locomotive or other vehicle, a relay electro-magnet whose circuit includes the rails of a section of track, and a relayed circuit governed by said magnet and formed through devices on the road-bed, and a section of conductor located on the vehicle and containing the controlling-magnet of the brake mechanism.

2. The combination, with a railway-brake, of a controlling-cock, a driving mechanism, a reducing-gear between said driving mechanism and the cock, and a governing electro-magnet whereby, when the magnet throws the driving mechanism into operation, a gradual application of the brakes may be produced.

3. The combination, with a railway-brake mechanism, of a controlling-cock, a driving-power, an intermediate reducing-gear, a governing electro-magnet on the locomotive or other portion of the train,

405,964.

and means controlled by said magnet for throwing the driving-power into operation.

4. The combination, with a railway-brake, of a controlling-cock, a driving-power, means connected with the same for giving a graduated movement to the cock under the operation of the driving-power, and a governing electro-magnet whereby, through the operation of the magnet, a gradual application of the brakes may be secured.

5. The combination, with a relay whose coils include the rails of a section of track, of a relayed circuit completed through the back contact of the armature, and means for periodically lifting the armature away from its circuit-closing stop.

6. The combination, with a railway-brake mechanism and a controlling-magnet therefor, of a circuit for said magnet, including the back contacts of a relay, and means for periodically lifting the relay from its back-contact stop.

7. The combination of a cock on a railway-vehicle, a magnet controlling the operation of the same, a circuit for said magnet including the back contacts of a relay, a circuit for said relay governed by the passage of a train over a section of track, and means for periodically restoring the armature of the relay to normal position, as and for the purpose described.

8. The combination of a relay in a normally-closed circuit, including circuit-breakers operated by the passage of a train, and means for periodically lifting the armature of the relay from its back contact.

9. The combination, with a railway-gate, of a circuit-controller therefor, a railway-brake mechanism, an electro-magnet governing the same and placed on the locomotive, and circuit-closing devices on the road-bed for completing the circuit of said magnet on the vehicle or locomotive when the gate is open.

10. The combination, with a railway-bridge, of an electric circuit passing over the same and including one or more thermostats, a cock on the locomotive or railway-train, and a controlling-magnet for the same governed by the condition of the circuit upon the bridge, whereby on the action of the thermostat device a cock may be turned through the controlling agency of the electro-magnet, as and for the purpose described.

11. The combination, with a railway-bridge, of a thermostat-circuit passing over the same, a locomotive or railway-vehicle carrying an electro-magnet whose circuit is governed by the condition of the thermostat-circuit, a railway-brake mechanism, and a controlling-cock therefor governed by said electro-magnet.

12. The combination, with a railway-bridge, of a thermostat-circuit, a railway-brake mechanism, a controlling-cock for the same, the governing electro-magnet on the locomotive or other vehicle, and a circuit for said magnet governed by the condition of the thermostat-circuit and the position of the locomotive with regard to circuit-closing devices on the road-bed.

13. The combination, with the controlling mechanism for a locomotive-whistle, of operating devices for actuating the same according to a signal-code, and a controller-magnet, as and for the purpose described.

14. The combination, with the controlling devices for a steam-whistle on a locomotive, of a driving-wheel carrying operating projections disposed and constructed in accordance with a signal-code, and an electro-magnet governing the operations of said wheel, as and for the purpose described.

15. The combination, on a locomotive, of a steam-whistle, governing devices therefor, a wheel H^3, carrying projections whose length and intervals correspond to a signal-code, a detent mechanism governing the rotation of the wheel, and a controlling electro-magnet on the vehicle having a circuit completed through devices on the road-bed.

16. The combination, with a locomotive-whistle and a controlling-magnet therefor, of a relay governing the action of said magnet, and a circuit for the relay including the rails of a railway-track.

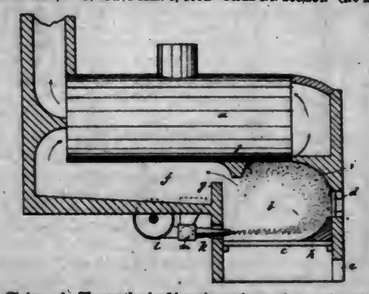
17. The combination, with a relay R and a section of track *b b*, the rails of which are included in a circuit with the relay, of one or more track-circuit breakers normally closed, but arranged in the circuit and in position to be operated by a passing train.

18. The combination, with a line of rails *b*, included in the circuit of the relay R, of one or more circuit-breaking devices interposed in said circuit for interrupting the relay-circuit on the passage of a train over the section of track.

19. The combination, with the cock D, and its driving electro-motor, of a controlling-magnet and a catch for holding the circuit of the motor closed, as and for the purpose described.

20. The combination, with a railway-car brake, of a controlling-cock, an electric motor geared to the same, a governing-magnet, a relay-armature for the same normally retracted, and a catch for holding the armature up and in position to close the circuit of the motor, as and for the purpose described.

405,965. AUTOMATIC RAILROAD-FROG. MICHAEL LEARY, Utica, N. Y., assignor of one-half to James F. Mann, same place. Filed Jan. 7, 1889. Serial No. 295,600. (No model.)



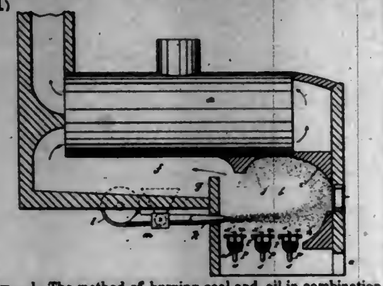
Claim.—1. In a railroad-frog, the combination of two stationary converging rails terminating in a V-shaped point, a movable rail having the point of the angle between the body line and tapering point of the rail at or before the V-shaped point, and a movable rail having the angle between the body line and tapering point at the side of and behind the V-shaped point, substantially as described.

2. In a railway-frog, the combination of the two converging stationary rails terminating in a V-shaped point, a movable rail terminating in a tapering point, which taper is parallel with one side of the V-shaped point, and a movable rail terminating in a tapering point which converges with a side of a V-shaped point from the stationary rail toward the point, substantially as set forth.

3. In a railway-frog, the combination of the converging stationary rails terminating in a V-shaped point 2, a movable rail 3^a, having the point 4 thereof at or before the point 2, and a movable rail 3, having point 8 thereof at the side of the V-shaped point, substantially as described.

4. In a railway-frog, the combination of two stationary converging rails terminating in a V-shaped point 2, a movable rail 3^a, having a tapering point 11 removed from the side of the V-shaped point 2, and the point 4 of the rail 3^a at or in advance of the V-shaped point 2, and movable rail 3, having tapering point 9 adjacent to the side of V-shaped point 2, substantially as described.

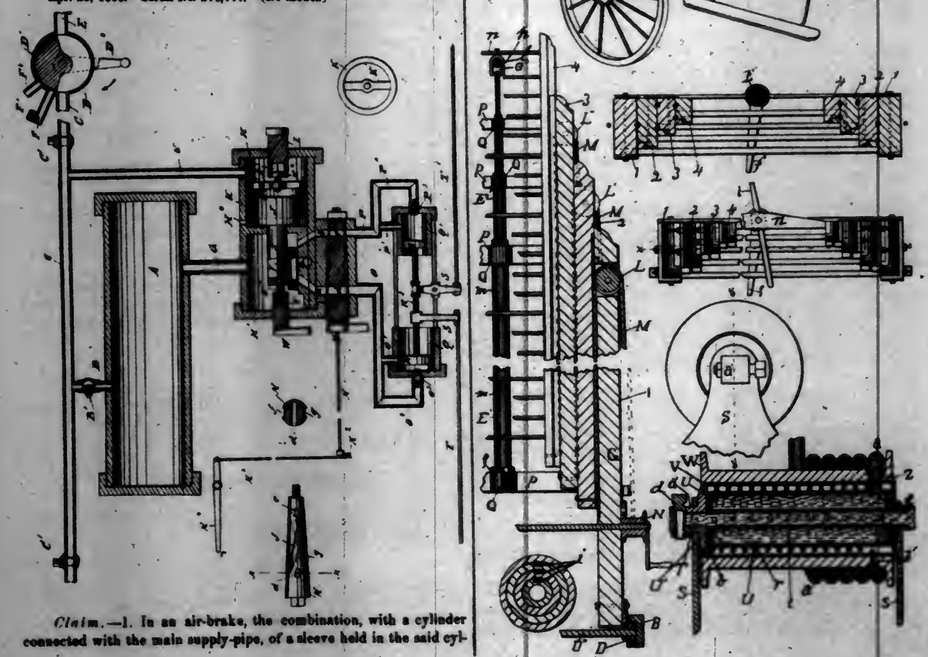
405,966. PROCESS OF BURNING CULM OR PULVERIZED COAL. ALLAN MASON, Brooklyn, assignor to Herbert H. Sanderson, trustee, New York, N. Y. Filed Mar. 5, 1888. Serial No. 266,281. (No model.)



Claim.—1. The method of burning culm or fine coal, which consists of injecting it into the furnace-chamber and deflecting the injected

stream backward over and into the incoming jet or jets in continuous suspension during combustion over a still air-space in which the ashes collect separately from the burning coal and maintaining therewith an igniting and renewing fire, substantially as described.

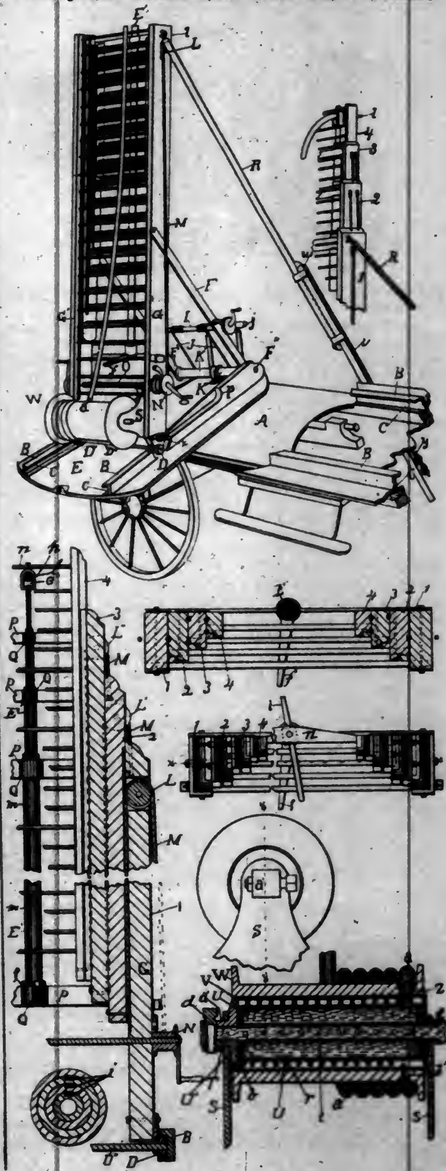
2. The method of burning culm or pulverized coal and lump coal in combination by injecting the pulverized coal into and for a time maintaining it in suspension in the furnace-chamber by the injecting forces and at the same time burning the lump coal below the injected fine fuel in independent or separate burners between which the coal-ashes are precipitated, substantially as described.



405,967. PROCESS OF BURNING COAL AND HYDROCARBON FUEL. ALLAN MASON, Brooklyn, assignor to Herbert H. Sanderson, trustee, New York, N. Y. Filed Mar. 5, 1888. Serial No. 266,282. (No model.)

Claim.—1. The method of burning coal and oil in combination, which consists in maintaining independently-supplied separate and locally distributed oil-fires in the lower portion of the furnace-chamber, producing an essential portion of the heat generated, and at the same time separately injecting fine coal into the furnace above the oil-fires, and for a time maintaining it in suspension over and about the oil-fires, substantially as described.

2. The method of burning coal and liquid hydrocarbon fuel in combination by injecting the pulverized coal into and for a time maintaining it in suspension in the furnace-chamber by the injecting forces, and at the same time burning liquid hydrocarbon fuel below the injected fine fuel in independent or separate burners, between which the coal-ashes are precipitated, substantially as described.



405,968. AIR-BRAKE. JAMES M. MAXWELL, Pittsburg, Pa., assignor to himself, and Michael M. Comerford, Fairmont, W. Va. Filed Apr. 25, 1888. Serial No. 271,777. (No model.)

Claim.—1. In an air-brake, the combination, with a cylinder connected with the main supply-pipe, of a sleeve held in the said cylinder, a screw for regulating the throw of the said sleeve, and a piston connected with a slide-valve for operating the brakes, the said piston being held to slide in the said sleeve, substantially as shown and described.

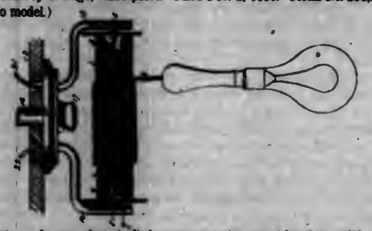
2. In an air-brake, a cylinder connected with the main air-pipe, an air-chest held on the said cylinder, and an auxiliary reservoir connected by a pipe having a check-valve with the main air-pipe, and also with the said air-chest, in combination with a piston held to slide in the said cylinder, a slide-valve operating over ports in the said chest and actuated by the piston-rod of the said piston, two cylinders connected with the inlet-ports, and pistons held in the said cylinders and connected with each other and operating the brakes, and a reversing-valve for changing the connection between the air-chest and the said two cylinders, substantially as shown and described.

405,969. PORTABLE EXTENSION-LADDER. WINFIELD S. OGLE, Los Angeles, Cal. Filed Jan. 14, 1889. Serial No. 296,870. (No model.)

Claim.—1. A set of extension-ladders mounted upon a carriage and provided with ropes and windlass N for extending them, seated at the foot of the outer ladder in lateral grooves or runways extending along in side pieces B of platform A to and upon turn-table E, in which ways supporting and carrying wheels D, attached to the rails of the outer ladder G G', run, in combination with hinged braces F, provided with ropes J, and windlass-shaft I for moving the ladders rearward, substantially as described.

2. A set of extension-ladders organized as described, in combination with a windlass or equivalent power mechanism, a hose and hose-reel, a water-receiver, and a hose supporter or bridle for elevating the hose, substantially as set forth.

3. A set of extension-ladders organized as described, in combination with an extensible and axially-adjustable sectional brace connected by cross-ties and collars with the ladders and working uniformly with said ladders, substantially as described.



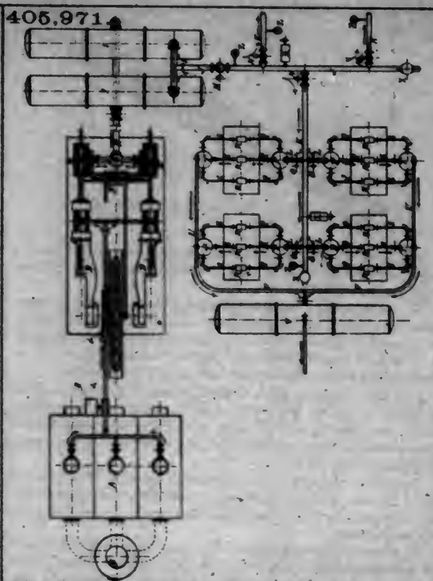
4. The axially-adjustable sectional extension-ladder brace having a hand-lever attached thereto at the bottom, in combination with a water-hose and nozzle held by a yoke or bridle rigidly fastened to the top thereof and swiveled to the upper broad rung of the topmost ladder, substantially as and for the purpose specified.

5. The hose-reel, in combination with a rotary water-receiver and fixed perforated axle and a retracting-spring, substantially as described.

6. The combination of the hose-reel, the retracting-spring located between the hose-reel and the water-receiver, and the perforated fixed axle provided with ingress-orifices at one end and the faucet at the opposite end, substantially as and for the purpose specified.

7. The set of extension-ladders organized as described, movable in runways connecting platform A with turn-table E, provided with stops *p p*, in combination with windlass-shaft I on braces F, and ropes J, connected to the foot of the ladders and passing around spools K K aligned horizontally with the runways and foot of the ladders, substantially as described.

405,970. ADJUSTABLE SUPPORT FOR INCANDESCENT ELECTRIC LIGHTS. JOHN T. PEARSON, St. Louis, Mo., assignor of one-half to Harvey S. Page, same place. Filed Feb. 2, 1889. Serial No. 298,530. (No model.)



Claim.—In an electric-light support, the combination, with the hanger-frame having tubular hangers 13 14, through which the conducting-wires 21 22 pass, of the spring-roller 1, bearing in the hanger-tubes and having metallic caps 6 9, and pins 5 7, which form electrical connection with the conducting-wires, and a flexible electro-conductor 3, having electrical connection with the metallic caps 6 9, and carrying at its outer end an incandescent light, substantially as set forth.

405,971. MEANS OR APPARATUS FOR THE PRODUCTION AND DISTRIBUTION OF COMPRESSED AIR. VICTOR POPP, Paris, France, assignor to the Popp Compressed Air and Electric Power Company, (Limited.) Filed Sept. 29, 1886. Serial No. 214,846. (No model.) Patented in France Nov. 27, 1885, No. 172,574, and in England Dec. 15, 1885, No. 15,420.

Claim.—1. In a system of compressed-air distribution, the combination, with a central compressor, of a conduit and branches leading therefrom, an automatic pressure-regulator maintaining in said conduit a pressure greater than that at which the air is to be utilized, and two or more utilizing-stations connected with said conduit and each provided with distinctively-adjusted pressure-reducing apparatus, substantially as described.

2. In a system of compressed-air distribution, the combination, with a compressor at the distributing-station, of a main conduit, connected therewith and extending throughout the district to be supplied, a regulator maintaining a constant pressure in said conduit, a series of branch conduits adapted for a lower pressure, each leading from the main through an automatic pressure-reducer and air-utilizing apparatus at consumers' stations connected to each of said branches, whereby the varying local demands of the system may be automatically supplied.

3. In a system of compressed-air distribution, the combination, with a compressor at the distributing-station, of a main conduit connected therewith and extending throughout the district to be supplied, a regulator maintaining a constant pressure in said conduit, a series

of branch conduits adapted to a lower pressure, each leading from the main through an automatic pressure-reducer, and utilizing apparatus at the consuming-station connected to each branch conduit and automatic pressure-regulator at each station, whereby the varying demand of any locality may be supplied and the apparatus adjusted at each consumer's station.

4. In a system of compressed-air distribution, the combination, with a main compressor, of main and branch pipes leading therefrom and two or more consumers' stations, each provided with a local reservoir, and an automatic pressure-regulator placed at an intermediate point between the reservoir and the supply-pipe.

5. In a system of compressed-air distribution, the combination, with the main-supply compressor, of main and branch conduits, two or more consumers' stations with apparatus for utilizing air-pressure, a pipe connecting said stations and leading to a reservoir, a connection between said pipe and the exhaust of the said apparatus at the stations, and secondary apparatus connected with the said reservoir for utilizing the reduced air-pressure.

6. In a system of compressed-air distribution, the combination, with conduit conducting the air, of a strainer extended transversely across the conduit, the conduit being provided with an opening in front of the strainer for removing the accumulation of dirt.

7. In a system of compressed-air distribution, the combination of the screen M, Fig. 8, the pipe G, with a downward opening, and the outlet-pipe A, leading from the opposite side of the screen.

8. The combination, with the reservoir A, Fig. 8, placed at the lowest point of a distribution-pipe for collecting the moisture from the fluid in the pipes, of a screen M in its upper part extending across the circuit of the fluid.

9. The combination, with moisture-reservoir A, placed in a distribution system of compressed air at a low point, so as to receive the drainage by gravity, of screen M and inlet and outlet pipes G and H, with their openings upon opposite sides of screen M, respectively.

10. A moisture-reservoir for a system of compressed-air distribution, having a screen above the water extending across the circuit of the air and a perforated partition below the said screen for catching the dirt therefrom, while allowing the moisture to pass through an opening being made above the said partition for removing the accumulation.

405,972. NAIL. WILLIAM TAYLOR, Allegheny, Pa. Filed Apr. 9, 1888. Serial No. 270,182. (No model.)

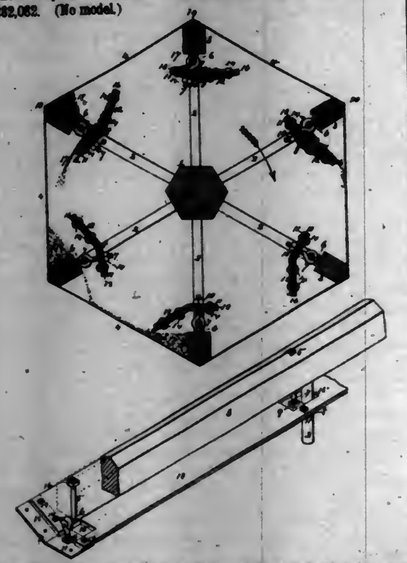
Claim.—1. A nail having a shank of greater breadth than thickness and uniform throughout in breadth and thickness, and having a head at one end and a point at the other end tapered from the shank to a cutting-edge, substantially as described.

2. A wire nail having a flattened laterally-projecting head, a flat shank uniform throughout in breadth and thickness and of greater breadth than thickness, and having a point tapering from the thickness of the shank to a cutting-edge, substantially as set forth.

3. A nail having a flattened head which projects laterally over

405,972.

all sides of the shank, a point, and an intermediate shank which is flat from end to end—that is to say, uniform in breadth and thickness throughout, as set forth.



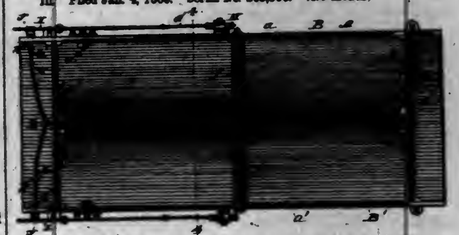
4. A nail having a flattened laterally-projecting head, a wedge-shaped point, and an intermediate shank which is flat from end to end—that is to say, of greater breath than thickness and uniform throughout in breadth and thickness, and having rounded or curved edges between the broader sides or faces, substantially as set forth.

5. A nail having a head, a shank which is flat and uniform throughout in breadth and thickness, and has round or carved edges between the wider faces, and a point having flat faces converging to a cutting-edge which is parallel to the said wider faces of the shank, substantially as set forth.

6. A wire nail having a head formed of laterally bent or stayed fiber of the wire, a shank of greater breadth than thickness and uniform throughout in both breadth and thickness, and a point, substantially as described.

7. A wire nail having a head of laterally bent or stayed fibers of wire, a wedge-shaped point, and a shank of greater breadth than thickness and uniform throughout in breadth and thickness and having curved or rounded edges provided with nicks or notches, substantially as set forth.

405,973. BOLTING-REEL. JAMES R. WELCH, Petersburg, Ill., assignor, by direct and mesne assignments, of one-third to Dedrich Fisher and Thompson W. McNeely, same place. Filed Aug. 6, 1888. Serial No. 282,082. (No model.)



Claim.—1. The combination, with a bolting-reel, of a shoe composed of strips parallel with the ribs and hinged thereto and set angularly to each other, so as to form a trough with its concave side toward the reel, and having apertures for the passages of the arms of the reel longer transversely than the diameter of the arms, substantially as and for the purpose set forth.

2. The combination of the eyebolts 5, adapted for attachment to the rib of a bolting-reel, eyebolts 7, hung to eyebolts 5 and carrying adjustable nuts 9 and 10, angular bracket-plates 8, through which the bolts 7 pass, and strips 13 and 16, secured to the brackets, substantially as and for the purpose set forth.

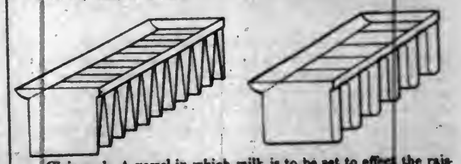
3. The combination of the eyebolts 5, adapted for attachment to the ribs of a bolting-reel, eyebolts 7, hung to eyebolts 5 and carrying nuts 9 10 for adjustable attachment, bracket-plates 8, through which the bolts 7 pass, and strips 13 and 16, secured to the bracket-plates and having apertures for the passage of the reel-arms, substantially as and for the purpose set forth.

4. The combination, in a bolting-reel, of eyebolts 5, attached to the ribs 3, eyebolts 7, hung upon the bolts 5, bracket-plates 8, attached to the bolts 7 by nuts 9 10, bearing against the opposite sides of the bracket-plates, and strips 13 16, attached to the bracket-plates, forming a trough with apertures 15 for the passage of the arms and of greater transverse length than the diameter of the arms, substantially as and for the purpose set forth.

405,974. DUMPING-WAGON. GEORGE WORTHINGTON, Plainfield, Ill. Filed Jan. 4, 1889. Serial No. 295,390. (No model.)

Claim.—1. A dumping-wagon whose bottom is made in two sections arranged longitudinally in the bed and hinged centrally therein to enable the sections to drop away from the sides, respectively, of the bed, said bottom sections at the line of their hinges being supported from a cross-truss, substantially as described.

2. The combination, in a wagon-bed, of a dumping-bottom and a truss, said truss arranged crosswise in said wagon-bed between the ends thereof, and having a connection leading downward to said bottom, substantially as described.

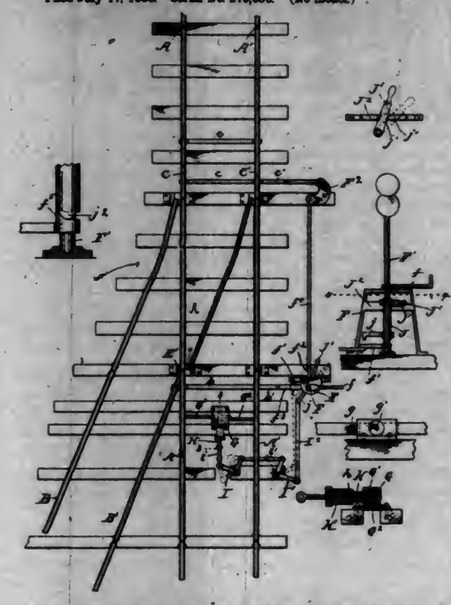


3. The combination, in a wagon-bed, of the hinged sections B B', the cross-bars and the cross-truss, said bottom sections at the line of their hinges being supported from a cross-truss, substantially as described.

4. The combination, in a wagon-bed, of the dumping-sections B B', the cross-bars D D', the cross-truss, and means for raising and lowering the cross-bars and sections, and a connection leading from said cross-truss to said dumping-sections, substantially as described.

5. A dumping-wagon bed whose bottom is in sections working independently of each other and each section having its own cross-bar for raising and lowering it and said sections being upheld along the central line of the bed-bottom by means of a connection leading to a cross-truss overhead, substantially as described.

6. A dumping-wagon bed whose bottom is in sections working independently of each other and each section having its own means for raising and lowering it and said sections being upheld along the central line of the bed-bottom by means of a connection leading to a cross-truss overhead, substantially as described.



405,975. DEVICE FOR RAISING CREAM FROM MILK. WILLIAM H. WELLS, Evershot, County of Dorset, England. Filed Nov. 5, 1888. Serial No. 290,014. (No model.) Patented in England Sept. 12, 1888, No. 13,216; in France Oct. 29, 1888, No. 195,797; in Belgium Oct. 30, 1888, No. 83,776; in Canada Dec. 26, 1888, No. 30,485, and in Italy Dec. 31, 1888, No. 24,387.

Claim.—1. A vessel in which milk is to be set to effect the raising of cream, formed with narrow parallel cells all opening at the top into one shallow cream reservoir or receptacle, two ends of which are vertical and parallel with each other, and one or both sides of which are curved or inclined outwardly from one end piece to the other to allow of a skimmer being inserted at the curved side and passed across the bottom of the cream reservoir or receptacle to remove at one operation all the cream from the milk below it.

2. The combination, substantially as hereinbefore set forth, of a narrow vertical cell and a shallow horizontal cream reservoir or receptacle above the cell, said cream-receptacle having vertical parallel end pieces, and having one or both of its sides curved outwardly and extending from one end piece to the other, for the purpose specified

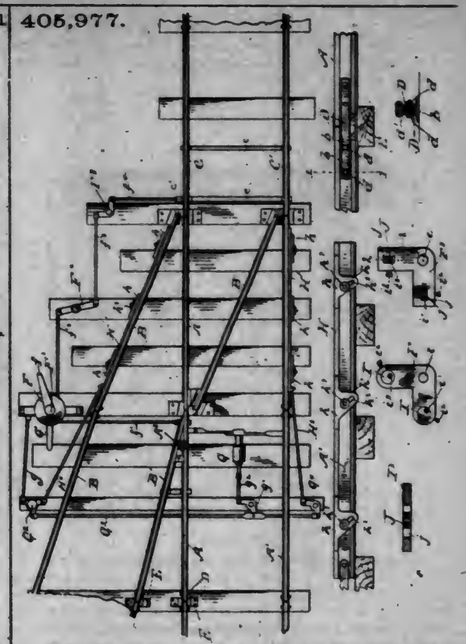
405,976. RAILWAY-SWITCH. AARON A. ACKERLY, Chicago, Ill. Filed July 11, 1888. Serial No. 279,636. (No model.)

Claim.—1. The combination, with the crossing-rails A and B', one pair of which is laterally movable, of the saddle or chair E, provided with projections E', located one on each side of the crossing and each having a height substantially equal to that of the rails, whereby a bearing for the tread of the wheels is formed in both positions of the movable rails, substantially as and for the purposes specified.

2. The combination, with the crossing-rails A and B', one pair of which is laterally movable, of the saddle E, having a bearing-surface for the said rails, a central projection *e* to fit between the fixed rails, and lateral projections E', these latter being both of a height substantially equal to that of the rails, substantially as and for the purposes specified.

3. The combination, with the crossing-rails arranged in pairs, one of which pairs is movable, of an arm attached to said movable pair, a locking device arranged immediately adjacent thereto to positively engage said arm and lock the movable rails, the switch-stand provided with a lever and connecting devices to move the said crossing-rails laterally, and a separate lever and separate connecting devices, whereby said locking device may be operated from the switch-stand, substantially as and for the purposes specified.

4. The combination, with the movable crossing-rail, of an apertured bar secured thereto, a keeper through which said bar slides, a spring-controlled locking-bolt for actuating said apertured bar, and operating mechanism for actuating said bolt, substantially as and for the purposes specified.



5. The combination, with the movable rail A, having apertured bar G', of the fixed rail A', having apertured bar G^3, the box or keeper G, to receive said bars, and the locking-bolt H, substantially as and for the purposes specified.

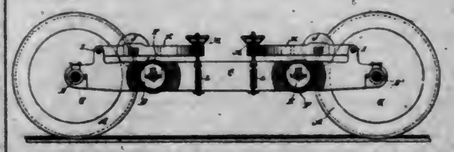
6. The combination, with the laterally-movable crossing-rails and the rock-shaft F', for operating the same, said rock-shaft being provided with a cam, of the sleeve J, mounted on said rock-shaft and free to move vertically on and around the same, the handle-lever and its bar provided with seats for locking the same, and the spring locking-bolt connected to said sleeve and operated thereby, whereby the rotation of the rock-shaft will free the locking-bolt, substantially as and for the purposes specified.

405,977. RAILWAY-SWITCH. AARON A. ACKERLY, Chicago, Ill. Filed Oct. 17, 1888. Serial No. 288,306. (No model.)

Claim.—1. The combination, with the laterally-movable main rail A, of the laterally-movable siding-rail B', rigidly connected to said rail A at its front end, the fixed siding-rail B, the fish-plates D, and the bolts *d*, connecting said fish-plates and provided with sleeves or thimbles *d'*, said plates passing through suitable slots *b* in the movable rail B', substantially as and for the purposes specified.

405,977.

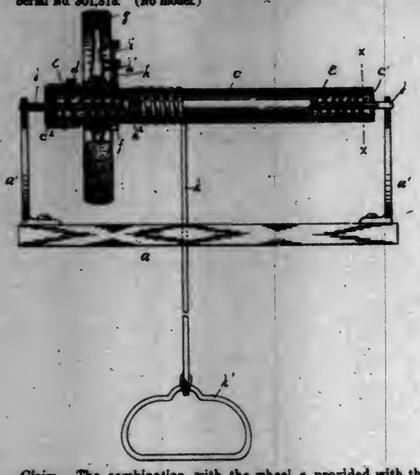
2. The combination, with the laterally-movable crossing-rails A and B', rigidly connected at their meeting ends, of the filling A^3, of wood or other suitable material, secured in the angle between said rails, substantially as and for the purposes specified.



3. The combination, with the laterally-movable switch and crossing rails and their operating mechanism, of locking mechanism for securing the same in position, and guard-slides connected to the fixed main and siding rails between the switch and crossing rails and controlled by the locking mechanism, substantially as and for the purposes specified.

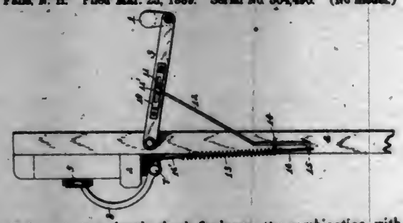
4. The combination, with the lock G, link g^2, and bell-crank g', of the hand-lever G', connecting-rod g, three-armed lever G^2, transverse rod G^3, bell-crank lever G^4, and the slides H and H', connected, respectively, to the three-armed lever G^2 and bell-crank lever G^4, substantially as and for the purposes specified.

5. The combination, with the laterally-movable switch and crossing rails, of the switch-stand and its operating-lever, and suitable connecting-rods and intermediate levers, the pivots whereby the connecting-rods are connected to said levers being adjustable toward and from the fulcrum of the lever, substantially as and for the purposes specified.



6. The combination, with the laterally-movable switch-rails C and their operating-lever, of the connecting-rods, the intermediate lever F, provided with slots *j*, the blocks J, mounted in said slots and adjustable therein, securing devices for said blocks, and the pivots j' and j^3, mounted in said blocks, substantially as and for the purposes specified.

405,978. ELECTRICALLY-PROPELLED VEHICLE. RICHARD H. ALLEN, Cleveland, Ohio. Filed Mar. 11, 1889. Serial No. 302,794. (No model.)



Claim.—The combination, with the motor-shaft and car-axle, both provided with friction pulleys or drums, of a pivoted lever or frame, friction-wheels carried thereby and adapted to be brought by the frame into contact with both pulleys or drums, and an adjustable spring-connection between the frame and a fixed support, the tension of which acts to force the friction-wheels against the pulleys and drums, as set forth.

405,979. APPARATUS FOR REVOLVING EMERY OR OTHER WHEELS. AUGUSTUS ALTENBURG, Buffalo, N. Y., assignor of two-thirds to Donald C. Sweet and Henry Ganson, same place. Filed Mar. 5, 1889. Serial No. 301,818. (No model.)

Claim.—The combination, with the wheel *g*, provided with the spring-pressed pawl *h*, of the hollow sleeve or cylinder *c*, loosely mounted upon the fixed axle *b* and having the ratchet-wheel *f* rigidly secured thereto, the spiral spring *e*, secured at its ends to the fixed axle *b* and to the sleeve *c*, the strap *k*, and its stirrup *k'*, substantially as and for the purpose stated.

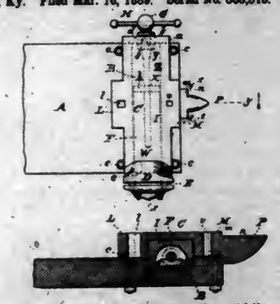
405,980. SHUTTLE-CHECK FOR LOOMS. NAPOLEON BOIVERT, Salmon Falls, N. H., assignor of three-fourths to James Hamilton and Herbert E. Hamilton, both of same place, and Edward M. Ball, Great Falls, N. H. Filed Mar. 23, 1889. Serial No. 304,490. (No model.)

Claim.—1. In a shuttle-check for looms, the combination, with a lay, a crank-shaft, a lay-pitman, a swell, a rock-shaft carrying a binder arm or finger arranged to impinge against the swell, and a spring connected to said rock-shaft, of a vertically-reciprocating rod pivotally connected to the lay-pitman at an intermediate point of its length and at its opposite end to the spring, and a fixed guide on the lay-sword in which said rod is fitted, all arranged and combined for operation in the manner and for the purpose specified.

2. The combination, with a lay, a crank-shaft, a lay-pitman, a swell, a rock-shaft carrying a binder arm or finger, and a spring connected to said rock-shaft, of a vertically-reciprocating rod connected at its lower end to said spring, and adjustably connected by means, substantially as described, to the lay-pitman to vary its vertical movement or play, and a guide in which said reciprocating rod is fitted, combined and arranged for operation substantially as and for the purpose described.

3. The combination, with a lay, a crank-shaft, a lay-pitman, a swell, a rock-shaft carrying a binder-arm, and a spring connected to the rock-shaft, of a slotted bracket applied laterally to the lay-pitman, a vertically-reciprocating rod connected at its lower end to the spring and having a laterally-bent portion pivoted on a bolt which is adjustably secured in the slotted bracket, and a fixed guide in which the lower straight end of said rod is fitted, substantially as and for the purpose described.

405,981. PRESSURE-REGULATING VALVE. GEORGE A. BOYDEN, Baltimore, Md., assignor to the Boyden Power Brake Company, same place. Filed Jan. 7, 1889. Serial No. 295,626. (No model.)



Claim.—1. A pressure-regulating valve having a casing with two chambers, the chambers having a communicating passage within the casing, a piston in one of said chambers having one end of its rod passing into the other chamber, a valve secured to the end of said rod and having a seat on the wall of the opening of an inlet-pipe to said last-mentioned chamber, a hollow cap with points on the end of the casing, and a spring in the piston-chamber, substantially as and for the purpose set forth.

2. In a pressure-regulating valve, the casing 3, having the chambers 4 and 5, and the communicating passage 7, the piston 8 in said chamber 4, having its stem projecting into chamber 5, the valve 18 on the end of said piston-rod, the cap 15, secured in one of the chambers and forming a seat for the valve 18, the spring 10, bearing against the piston 8, the nut 11, secured to said spring, and the abutting cap 12, the said parts being combined and arranged to operate substantially as specified.

3. In a pressure-regulating valve having a chamber with a piston therein, a hollow cap secured to the wall of the chamber and having inwardly-projecting points, and an inlet-passage communicating with the hollow cap above the piston, the said points of the cap adapted to limit the play of the piston, substantially as specified.

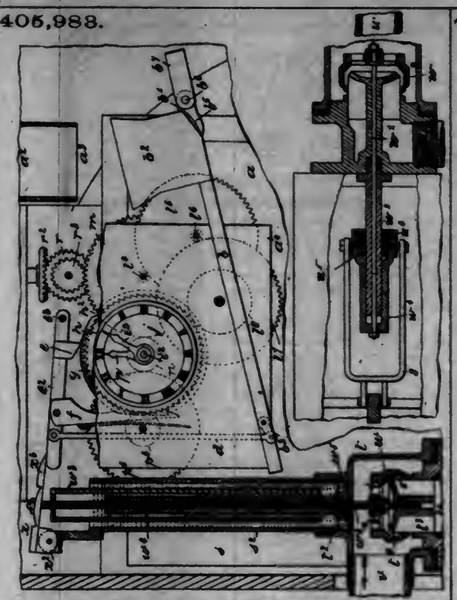
405,982. COMBINED ANVIL AND VISE. HENRY H. BRANDES, Corydon, Ky. Filed Mar. 16, 1889. Serial No. 303,515. (No model.)

Claim.—1. The anvil-casting having the middle anvil-offsets L and M, the fixed jaw D at its end, and below the same the loop-offset E, and the slideway, in combination with the movable jaw J, its slide, and the operating-screw, substantially as specified.

2. The anvil-casting having the middle anvil-offsets L and M, the wings W and Z in front and rear thereof, the fixed jaw D at the end of the front wing, and the front offset E, the rear offset *d*, and the middle offset *n*, respectively adapted to engage the front, rear, and end of the bench, substantially as specified.

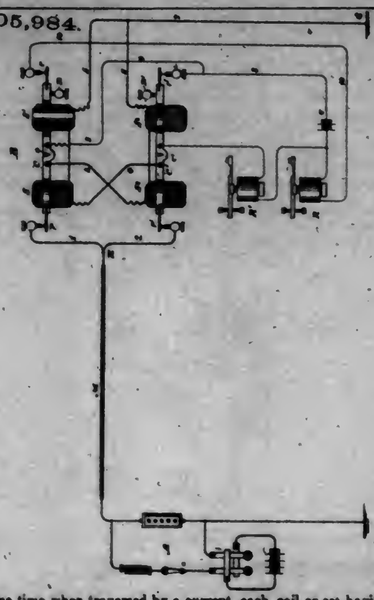
3. The combination, with the main anvil-plate having the slideway in its under surface, the lateral offsets at its middle portion, the end offset, and the fixed jaw, of the movable jaw beyond the fixed jaw, its slide and operating-screw, and the recessed bench, substantially as specified.

405,983. APPARATUS FOR VENDING GAS. ROWLAND W. BROWNHILL, Birmingham, County of Warwick, England. Filed June 12, 1888. Serial No. 276,847. (No model.) Patented in England May 13, 1887, No. 7,012; in France Mar. 5, 1888, No. 176,142, and Mar. 6, 1888, No. 176,220, and in Germany Mar. 12, 1888, Nos. 22,737 and 22,738, and Mar. 20, 1888, No. 23,292.



Claim.—1. The combination, with a gas-meter, of a valve located in the supply-pipe, and vending mechanism which is released and operated by the gravitating effect of a coin inserted within the apparatus or inclosing-casing, substantially as set forth.

2. The combination, with a gas-meter, a valve located in the supply-pipe, and vending mechanism, of a detent normally holding the vending mechanism from operation and adapted to be released by the insertion of a coin within the apparatus, as described and set forth.



3. The combination, with automatic vending mechanism located between a gas-meter and a supply-pipe containing a valve, of a detent normally holding the said mechanism from operation, and adapted, when released after the insertion of a coin or coins within the apparatus, to allow a predetermined measured quantity of gas to be supplied equivalent in value to the said coin or coins inserted, as set forth.

4. The combination, in a gas-vending apparatus, of disks *A o*,

405,988.

405,984.

having notches h^3 b^3, and the lever c^4, having a tooth or catch *c*, as set forth.

5. In gas-vending apparatus, the combination, with the disks *A* and *o*, spindle *i* i^3, finger i^3, ratchet-wheel *g*, and pinion *n*, of the coin-operated lever *b*, and the intermediate mechanism, whereby, when the lever moves, the disks are operated, as set forth.

6. In gas-vending apparatus, the combination, with the disks *o A*, of the transmitting and reduction gear and means i^3 *n* p^2 p^3 p^4 p^5 p^6, adapted for transmitting motion to the said disk and finger *p*, as set forth.

7. In gas-vending apparatus, the combination, with the disks *A* h^3 and arbor *i*, of wheels *q* q^2 and transmitting and reduction gear *m* *p* *p* *p* *p* *p* *p*, as set forth.

8. In gas-vending apparatus, the combination, with the arbor *i* and disk and ratchet-wheel *h g*, of a toothed wheel *q*, with annulus q^3, and the wheels g^3 g^2, bracket g^4, and counterpoise-weight g^5, designed for making and breaking connection between the said arbor and gear, as set forth.

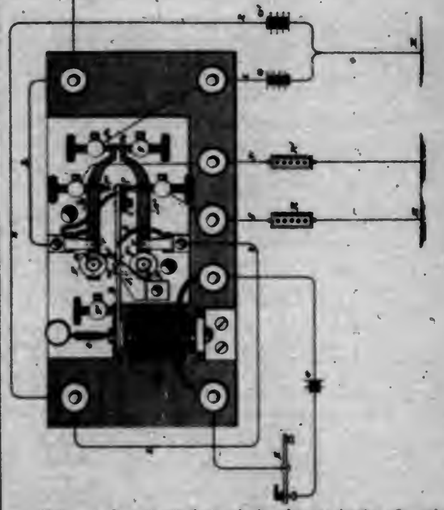
9. In gas-vending apparatus mechanism, the combination of the measuring-out disks *A* A^2, having notches *o* o^3, lever c^3, having tooth or catch *c*, and wheel *l*, adapted for stopping the gas-flow, as set forth.

10. In gas-vending apparatus, the combination, with the wheel *q* and its annulus q^3, and arbor *i*, disk *A*, and ratchet-wheel *g*, of a sun-and-planet pinion g^2 and its cognate parts g^3, g^4, g^5, g^6, and g^7, adapted for making and breaking connection between the driving-gear and disks, as set forth.

11. The combination, with a gas-meter, of gas-vending mechanism comprising a counterpoise-lever *b* b^2 b^4, with coin-box b^3, adapted for controlling the operation of the vending mechanism through the gravitating effect of a coin, as set forth.

12. The combination, with the balanced coin-operated lever, of connecting-rod *d*, catch-arm c^2, having catch *c*, pawl *f*, and ratchet-wheel *g*, as set forth.

13. The combination, with a meter and mechanism, substantially as described, for controlling the flow of gas and registering the value thereof, of a coin-operated lever connected to said mechanism and provided with a coin-receptacle having a hinged and wedged bottom, substantially as described.



14. The combination, with a meter and service-pipe, of gas measuring and registering mechanism, substantially as described, and a delivery and cutting-off valve *w*, connected to and controlled by said mechanism, as set forth.

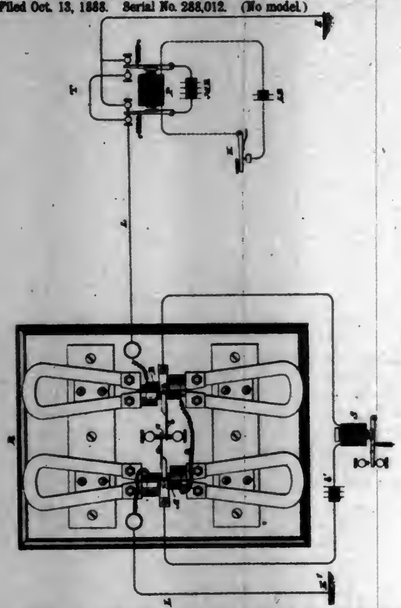
405,984. TELEGRAPHY. CHARLES G. BURKE, Richmond Hill, assignor to Frederick Wolfe, trustee, New York, N. Y. Filed Aug. 4, 1888. Serial No. 281,954. (No model.)

Claim.—1. The combination of a telegraphic circuit, means for transmitting thereon currents of opposite polarities, two independent coils or sets of coils normally in said circuit, fields of force for said coils, and stops permitting the motion of but one coil or set at the same time when traversed by a current, each coil or set having contact-points through which the line-connection of the other is made.

2. The combination of a telegraphic circuit, means for transmitting thereon currents of opposite polarity, two independent relays normally in said circuit, stops permitting the operation of but one relay at the same time, each relay having contact-points through which the line-connection of the other is made, and a local circuit having two recorders therein, operated, respectively, by said relays.

405,985. TELEGRAPH-INSTRUMENT. CHARLES G. BURKE, Richmond Hill, assignor to Frederick Wolfe, trustee, New York, N. Y. Filed Sept. 8, 1888. Serial No. 284,502. (No model.)

Claim.—1. In a circuit-closing device, the combination of a main arm and two auxiliary arms frictionally attached thereto, said auxiliary arms carrying circuit-closing points which are caused to simultaneously approach or separate from each other by the motion of the main arm.



2. The combination of a local battery, a Morse key, an electro-

magnet, an armature-lever, and two auxiliary arms frictionally connected therewith and carrying circuit-closing points which are caused to simultaneously approach or separate from each other according to the motion of the armature-lever.

3. The combination of a local battery, a make-and-break key, an electro-magnet, an armature-lever, and two auxiliary arms frictionally attached to such armature-lever and carrying circuit-closing points which are made to simultaneously approach or separate from each other by the movement of the armature-lever, the range of motion of the armature-lever being greater than that of the auxiliary arms.

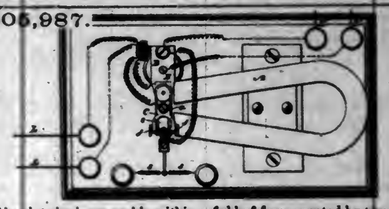
405,986. TELEGRAPHIC INSTRUMENT.

CHARLES G. BURKE, Richmond Hill, assignor to Frederick Wolfle, trustee, New York, N. Y. Filed Oct. 13, 1888. Serial No. 288,012. (No model.)

Claim.—1. A compound telegraphic receiving-instrument having two coils upon independent centers, movable simultaneously in fields of force, each coil carrying an arm, said arms being attached to the axes upon which the coils turn, and which are caused to simultaneously approach or separate from each other by the motion of said coils.

2. In a telegraphic instrument, the combination of a field of force, two coils having simultaneous motion upon independent centers, an arm attached to the axis of each coil and carrying contact-points, and a local circuit of which both said arms are a part.

3. In a telegraphic instrument, the combination of two coils, each moving independently upon its center and forming part of the main-line circuit, magnets supplying a field of force to each coil, an arm carrying a contact-point attached frictionally to each solenoid, and a local battery having its circuit common to both of said arms, the said parts being so adjusted that the movements of the coils under the influence of a current passing through them shall cause the said arms to approach each other.



4. The combination of a main line, a battery therefor, a device for transmitting impulses thereon, two coils independently and simultaneously movable and forming part of said main line, fields of force for said coils, and independent contact-arms attached to the axes of said coils, substantially as described, for opening and closing a local circuit of which both said contact-arms are a part.

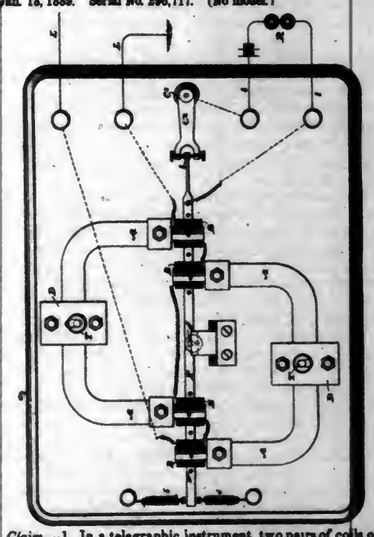
405,987. TELEGRAPHIC INSTRUMENT.

CHARLES G. BURKE, Richmond Hill, assignor to Frederick Wolfle, trustee, New York, N. Y. Filed Jan. 17, 1889. Serial No. 296,630. (No model.)

Claim.—1. In a telegraphic instrument, the combination of a coreless coil of insulated wire in the main circuit arranged to turn upon one of its diameters within a field of force created by opposite magnetic poles, both of said poles being presented to one of the faces of said coil, the section of the coil presented to one pole having its windings in a direction opposite to those of the section presented to the other pole.

2. In a telegraphic instrument, the combination of a coreless coil

of insulated wire movable within a field of force created by two magnets, one located on each side of said coil, each presenting both its poles to one of the respective faces of said coil, the section of the coil presented to one pole of each magnet having its windings in a direction opposite to those of the section presented to the other pole of the same magnet.



3. In a telegraphic instrument, a coreless compound coil composed of two parts movable in a field of force created by two magnets, opposite poles being presented to the same face of each one of said parts, the section of the coil presented to one pole of each magnet having its windings in a direction opposite to those of the section presented to the other pole of the same magnet.

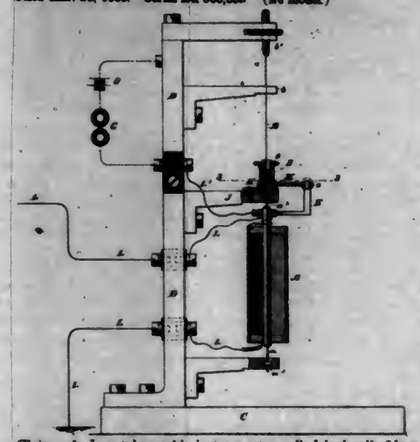
4. In a telegraphic instrument, a coreless coil of insulated wire arranged to turn upon one of its diameters within a field of force created by two magnets, each presenting opposite poles to the respective faces of said coil, the angular position of the poles of said magnets with reference to the coil being adjustable, the section of the coil presented to one pole of each magnet having its windings in a direction opposite to those of the section presented to the other pole of the same magnet.

5. In a telegraphic instrument, a flat coil of insulated wire wound in two parts separated from each other and fixed on each side of a common center movable in a field of force created by two magnets, each magnet presenting its opposite poles to the outer face of one of the parts of said coil, said magnets being fixed so that the faces of the poles of one magnet are not parallel to the faces of the poles of the other.

405,988. TELEGRAPH-INSTRUMENT.

CHARLES G. BURKE, Richmond Hill, assignor to Frederick Wolfle, trustee, New York, N. Y. Filed Jan. 18, 1889. Serial No. 296,717. (No model.)

Claim.—1. In a telegraphic instrument, two pairs of coils or solenoids connected in the line, said coils being affixed to a pivoted bar, one pair upon each side of the pivot, and two magnets having their poles on each side of the pivot and extending within said coils, as described.



2. In a telegraphic instrument, two pairs of solenoids affixed to a pivoted bar, one pair upon each side of the point of support, and two magnets each spanning said pivot or point of support, with their pole-pieces entering said solenoids.

3. The combination of the pivoted bar F, carrying the coils B, which are in the circuit of the main line, the magnets A A, each having one of its poles entering a coil on one side of the point of support of said arm F, the arm C^2, and contact-points *b*, which are in the local circuit.

4. In a telegraphic instrument, two pairs of solenoids affixed to a pivoted bar, one pair upon each side of the point of support, two magnets each spanning said pivot or point of support, with their pole-pieces entering said solenoids, and means, substantially as described, for adjusting the position of said magnets.

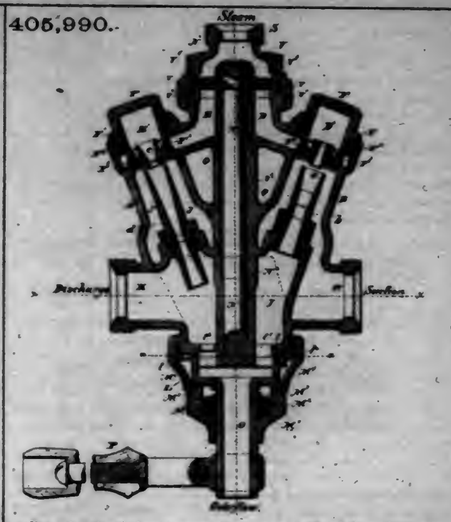
405,989. TELEGRAPHIC INSTRUMENT.

CHARLES G. BURKE, Richmond Hill, assignor to Frederick Wolfle, trustee, New York, N. Y. Filed Mar. 23, 1889. Serial No. 305,052. (No model.)

Claim.—1. In a telegraphic instrument, a cylindrical coil of insulated wire forming part of the main circuit and suspended within a field of force formed by one or more magnets, both poles of the same magnet being presented to the same side of the coil.

2. In a telegraphic instrument, a cylindrical coil of insulated wire forming part of the main circuit, suspended upon an axis coincident with the axis of the cylinder within a field of force created by one or more magnets, both poles of each magnet being presented to the same side of the coil.

3. In a telegraphic instrument, a coil of insulated wire forming part of the main circuit, suspended within a field of force formed by one or more magnets, and a local-circuit-closing device consisting of an arm attached to the axis of the coil moving with said coil between stops carried by a second arm turning upon an axis coincident with the axis of the coil.



4. A telegraphic instrument consisting of the combination of a coil of wire forming part of the main circuit, suspended within a field of force formed by one or more magnets, an arm attached to said coil, a second arm turning upon a center coincident with the axis of motion of said coil, carrying stops between which said first arm plays, and a frictional support for said second arm, whereby it may follow the movements of said first arm, both of said arms forming part of the local circuit.

5. In a telegraphic receiving-instrument, a circuit-closing device consisting of two independent movable parts insulated from each other, both forming parts of a common local circuit, one having an independent motion upon its axis and the other a free motion around the axis of the other, both being equal radii of a given circle, the part turning on its axis having a suitable contact-point playing freely between an insulated stop and a contact-point carried by and forming a portion of the other part, said insulated stop and contact-point being adjustable, the movement of the part turning on its axis being effected by electrical impulses over the main line, the motion of the other being wholly dependent upon the pressure exercised against its stops by the part moved by said main-line currents, the local circuit being made at any point within the entire range of motion of said parts whenever the two contact-points are brought together by the movement of the part turning on its axis, and broken whenever the same are separated by a contrary motion of said part.

405,990. INJECTOR.

CHARLES B. CHURCH, Boston, Mass., assignor to the Hancock Inspirator Company, same place. Filed July 17, 1888. Serial No. 280,196. (Model.)

Claim.—1. In an injector, a steam-chamber containing a valve to control the admission of steam, and an overflow-chamber containing a valve to control the overflow to the atmosphere, the two chambers being connected by an intermediate chamber N^3, communication between the steam-chamber and the overflow-chamber through the intermediate chamber being prevented by one or both of the valves, substantially as described.

2. In an injector, a steam-chamber and an overflow-chamber, a valve in the former to control the admission of steam and a valve in the latter to control the overflow to the atmosphere, the two valves being connected to and operated by a single stem, substantially as described.

3. In an injector, a steam-chamber containing a valve to control the admission of steam, and an overflow-chamber containing a valve to control the overflow to the atmosphere, the two valves being connected to and operated by a stem extending through the valve-seats, leakage around which is prevented by the valves, substantially as described.

4. In an injector containing two sets of jet apparatus, a steam-chamber and an overflow-chamber, a valve in the former to control the admission of steam to each apparatus and a valve in the latter to control the overflow to the atmosphere from each, the two valves being connected to and operated by a single stem, substantially as described.

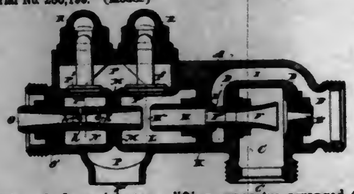
5. In an injector, a steam-chamber and an overflow-chamber, and an intermediate chamber N^3, connecting the two, the steam-chamber being provided with a valve to control the admission of steam, the overflow-chamber with a valve to control the overflow to the atmosphere, the two valves being joined by a connection in the intermediate chamber, whereby the movement of one of the valves operates the other, substantially as described.

6. In an injector containing two sets of jet apparatus, the combining-tubes of which converge in the direction of the flow of the fluid through them, an outlet or overflow passage to the atmosphere, located substantially in line with the respective axial lines of the two combining-tubes, whereby the fluid issuing from each combining-tube is discharged into the free air by a direct passage, substantially as and for the purpose described.

7. In an injector, a valve controlling the admission of steam and a valve controlling the overflow to the atmosphere, the two valves being connected to each other and operated the one by the other, the discharge-outlet from the overflow-valve being formed within a prolongation of that valve, substantially as described.

8. In an injector, an overflow-valve located in a chamber the interior of which is provided with a shoulder, between which and the valve-seat there is space enough to permit the valve to be rotated freely on its seat, but not enough to allow more than a slight movement away from its seat, substantially as and for the purpose described.

9. In an injector, an overflow-valve having a discharge-outlet to the atmosphere formed in its prolongation and located in a chamber, in combination with a spring whereby the valve is held against its seat, substantially as and for the purpose described.



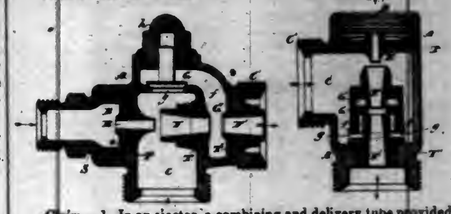
10. In an injector, an overflow-valve having a discharge-outlet to the atmosphere formed in its prolongation and located in a chamber, a passage from the delivery-chamber of the injector extending into the overflow-valve chamber and beneath the exterior of the valve, whereby, when the injector is in operation, the valve is held against its seat by water under pressure, substantially as described.

11. In an injector, an overflow-valve having a discharge-outlet

to the atmosphere formed in its prolongation and located in a chamber provided with elastic packing about the exterior of the prolongation, a passage from the delivery-chamber of the injector extending into the overflow-valve chamber, whereby, when the injector is in operation, the valve is held against its seat and the packing about its prolongation is compressed by pressure of the fluid thus admitted to the overflow-valve chamber, substantially as described.

12. In an injector, a cap-nut F, provided with a shoulder F', a screw-thread F^2, and one or more projections F^3, in combination with the casing of the injector and the steam-jet tube, whereby, when the cap-nut is screwed to its seat, the steam-chamber is closed and the steam-jet tube is held firmly in position, substantially as and for the purpose described.

405,991. INJECTOR. CHARLES E. CHURCH, Boston, Mass., assignor to the Hancock Inspirator Company, same place. Filed July 17, 1888. Serial No. 280,190. (Model.)



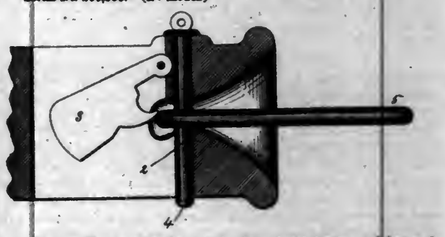
Claim.—1. In an injector, a lifting apparatus arranged to continuously deliver water to a forcing apparatus, the latter being provided with a waste opening or openings to the atmosphere at or near the throat of its combining-tube, and a waste-opening to the atmosphere between the mouth of its combining-tube and the throat, where the area of the bore of the tube in cross-section is greater than the combined area of the lifter and forcer steam-jet passages, the latter waste-opening being controlled by an automatic outwardly-opening valve to prevent indraft of air or the reflux of fluid at that opening from the waste opening or openings at or near the throat without interfering with the flow of fluid to the atmosphere from the latter opening, substantially as described.

2. In an injector, a lifting apparatus arranged to continuously deliver water to a forcing apparatus, the latter being provided with a waste-opening to the atmosphere at or near the throat of its combining-tube and a waste-opening to the atmosphere between the mouth of its combining-tube and the throat, where the area of the bore of the tube in cross-section is greater than the combined area of the lifter and forcer steam-jet passages, and with another waste-opening to the atmosphere in its combining-tube located between the other two openings, the opening nearest the mouth of the tube being controlled by an automatic outwardly-opening valve to prevent indraft of air or the reflux of fluid at that opening from the other waste-openings without interfering with the flow of fluid to the atmosphere from the other waste-openings, substantially as and for the purpose described.

3. In an injector, a lifting apparatus arranged to continuously deliver water to a forcing apparatus, the latter being provided with a waste-opening to the atmosphere at or near the throat of its combining-tube, and a waste-opening to the atmosphere between the mouth of its combining-tube and the throat, where the area of the bore of the tube in cross-section is greater than the combined area of the lifter and forcer steam-jet passages, and with another waste-opening to the atmosphere in its combining-tube located between the other two openings, the opening nearest the mouth of the tube being controlled by an automatic outwardly-opening valve to prevent indraft of air, or the reflux of fluid at that opening from the other waste-openings without interfering with the flow of fluid to the atmosphere from the other waste-openings, the other two waste-openings being controlled also by an automatic outwardly-opening valve, substantially as and for the purpose described.

4. In an injector, a lifting apparatus the combining-tube of which is provided at its mouth with the usual inlet for the admission of fluid from the suction-chamber and with a supplemental inlet formed by one or more ports communicating with the interior of said tube through one or more openings therein, and with the suction-chamber, and a valve to close the supplemental inlet, such lifting apparatus being arranged to continuously deliver water to a forcing apparatus, the latter being provided with a waste-opening to the atmosphere at or near the throat of its combining-tube, and a waste-opening to the atmosphere between the mouth of its combining-tube and the throat where the area of the bore of the tube in cross-section is greater than the combined area of the lifter and forcer steam-jet passages, the latter waste-opening being controlled by an automatic outwardly-opening valve to prevent indraft of air or the reflux of fluid at that opening from the waste opening or openings at or near the throat without interfering with the flow of fluid to the atmosphere from the latter opening, substantially as described.

405,992. EJECTOR. CHARLES E. CHURCH, Boston, Mass., assignor to the Hancock Inspirator Company, same place. Filed July 17, 1888. Serial No. 280,200. (Model.)



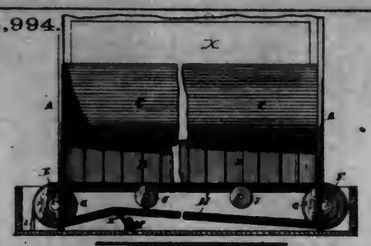
Claim.—1. In an ejector, a combining and delivery tube provided at its mouth with the usual inlet for the admission of fluid from the suction-chamber, and provided also with a supplementary inlet formed by one or more ports communicating with the interior of said tube through one or more openings therein and with the suction-chamber, and a valve to automatically close the said supplementary inlet whenever the pressure within the tube at said openings is greater than the pressure in the suction-chamber, substantially as set forth.

2. In an ejector, a combining and delivery tube provided at its mouth with the usual inlet for the admission of fluid from the suction-chamber, and provided also with a supplementary inlet formed by one or more ports communicating with the interior of said tube through one or more openings therein and with the suction-chamber, and a valve to close the said supplementary inlet, substantially as set forth.

3. In an ejector, a combining and delivery tube the bore of the combining portion of which converges from its mouth in the direction of the flow of the fluid through it, provided at its mouth with the usual inlet for the admission of fluid from the suction-chamber, and provided also with a supplementary inlet formed by one or more ports communicating with the interior of said tube through one or more openings therein at or near its throat and with the suction-chamber, and a valve to automatically close the said supplementary inlet whenever the pressure within the tube at said openings is greater than the pressure in the suction-chamber, substantially as set forth.

4. In an ejector, a combining and delivery tube the bore of the combining portion of which converges from its mouth in the direction of the flow of the fluid through it, provided at its mouth with the usual inlet for the admission of fluid from the suction-chamber, and provided also with a supplementary inlet formed by one or more ports communicating with the interior of said tube through one or more openings therein at or near its throat and with the suction-chamber, and a valve to close the said supplementary inlet, substantially as set forth.

405,993. CAR-COUPLING. ELISHA W. CADY, Chicago, Ill., assignor of one-half to Daniel C. Cooper, same place. Filed Feb. 11, 1889. Serial No. 299,535. (No model.)

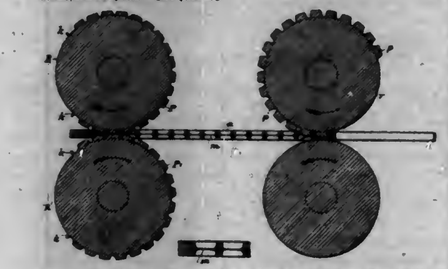


Claim.—The combination of the draw-head having a fulcrum 2 and a pallet 3, provided with a cup-shaped or concave seat, all substantially as described.

405,994. CONVEYER FOR FLOUR, &c. CHARLES [illegible], Hastings, Minn., assignor to himself and Otto J. A. Doebler, same place. Filed Feb. 28, 1889. Serial No. 301,516. (No model.)

Claim.—The apparatus comprising the main frame A, having trunks B B, chute-boards C, and shunt-boards D, and the drums G G, having concave peripheries and mounted on horizontal shafts at the ends of said trunks B, the endless flexible belt H, the supporting-rollers J J, convex tightener-pulley K, and brush I, all substantially as described.

405,994.



405,995. LUBRICATOR. JAMES GRACEY and GEORGE W. KERCH, St. Louis, Mo., assignors, by mesne assignments, to said Gracey and Aaron Straus, same place. Filed Mar. 16, 1888. Serial No. 267,369. (No model.)

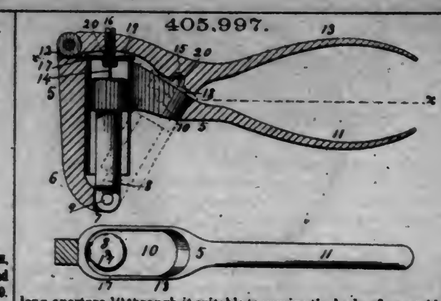
Claim.—In combination with a cylinder and piston-rod, a series of spokes d', extending outward from the latter and screw-threaded at their outer ends, a curved rim in two parts, nuts d^3 on said rods at the inner and outer faces of said rim, the bolt d^3, for holding the plates together, and a brush d^5, held between the parts of said rim and in contact with the inner face of said cylinder, for the purpose set forth.

405,996. MACHINE FOR MAKING BATTERY-PLATES. WILLIAM W. GIBSON, Haverford College, Pa., assignor to the Electrical Accumulator Company, of New York. Original application filed Sept. 23, 1887, Serial No. 250,470. Divided and this application filed Oct. 24, 1888. Serial No. 289,060. (No model.)

Claim.—1. The combination, in a machine for pressing battery-plates, of two die-sections, each section composed of a series of parallel rows of teeth or projections, each tooth or projection having the form or outline of a truncated pyramid, the teeth of one section registering with the teeth of the second section, and a knife or cutter for imparting the desired form or outline to such plate, substantially as described.

2. The combination, in an apparatus for pressing perforated metal plates, of two rolls or cylinders, each provided with a series of registering teeth or projections, and two rolls or cylinders, one of which has a series of teeth or projections so formed and arranged as to enter the perforations made by the first rollers to a point beyond the meeting-point of the teeth of such rollers.

3. The combination, in an apparatus for pressing perforated metal plates, of two dies, each provided with a series of registering teeth or projections, and a punch or die having a series of teeth or projections so formed and arranged as to enter the perforations made by the first-named dies to a point beyond the meeting-point of the first-named dies, all co-operating substantially as described.



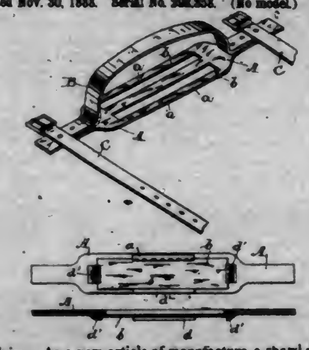
4. The die-plate R, having teeth P and outline-cutter k.

5. The combination of a pair of power-operated rollers having die-plates R R', teeth or projections P, and cutting-edge k.

405,997. CARTRIDGE CAPPER AND DECAPPER. WILLIE W. HARRIS, Sioux City, Iowa, assignor to Henry A. Lyon, same place. Filed Mar. 5, 1889. Serial No. 301,834. (No model.)

Claim.—1. The combination of a body portion 5, having an ob-

405,997.



long aperture 10 through it suitable to receive the body of a cartridge-shell, while the side walls of the aperture serve as a rest to the flange portion of the said shell, a ramrod 8, shaped at one end to pass through the head of the said shell, and pivoted near its other end to a portion of the said body to swing freely in the said aperture, a lever pivoted to the said body and provided with a cap-seat opposite one end of the said aperture and with a cap-receptacle and cartridge-head presser opposite the other end, the walls of the said aperture being higher from the pivot of the ramrod at that end of the aperture opposite the said cap-seat than at the end opposite the cap-receptacle, substantially as shown and described.

2. The combination of a body portion 5, a ramrod 8, and a lever 13, pivoted thereto, the said lever being provided with a cap-seat in one place and a cap-receptacle and cartridge-head presser in another place, the ramrod being adapted to swing to positions opposite the two places, and the body portion being provided with a seat for the flange of a cartridge opposite each of the said places, one of the said cartridge-seats being farther than the other from the pivot of the ramrod, substantially as shown and described, whereby a cartridge-shell placed upon the said ramrod may be first seated opposite the cap-receptacle and have a cap rammed out of it, and then be moved to the seat opposite the cap-seat and have a new cap pressed into it without intermediate removal from the ramrod.

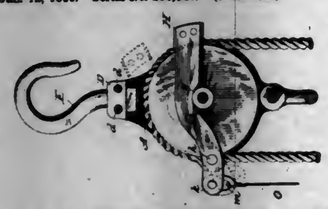
3. The combination of a body portion 5, having two seats for the flange of a cartridge, a ramrod pivoted to the body portion to swing from one seat to the other, and a lever pivoted to the body portion and provided with a cap-seat opposite to one of the said cartridge-seats and with a cap-receptacle and cartridge-presser opposite the other, the pivot of the ramrod being nearer to one of the cartridge-seats than to the other, substantially as shown and described, whereby the tip of the ramrod, when swung to one seat, will project beyond the plane thereof, and when swung to the other seat it will fall to reach the plane of the latter, as and for the purpose specified.

405,998. SHAWL-STRAP. WILLIAM F. HARVEY, Lewiston, Me. Filed Nov. 30, 1888. Serial No. 292,252. (No model.)

Claim.—As a new article of manufacture, a shawl-strap having a flat metal bar the central portion of which is widened and formed into three bars, and two longitudinal spaces between said bars, lips or flanges on the under side of said central portion to retain a name-card, and a handle and binding-straps attached to said bar, substantially as described.

405,999. METHOD OR PROCESS OF MAKING FOOT-BALLS. WILLIAM HOWARD, London, County of Surrey, England. Filed Sept. 4, 1886. Serial No. 212,766. (No model.) Patented in England Sept. 18, 1885, No. 11,099, and Dec. 1, 1885, No. 14,732.

Claim.—1. The hereinabefore-described method or process of making foot-ball covers, consisting in, first, stretching wet leather gussets



406,999.

upon a flat surface and leaving them thereon till they are dry; second, concaving them by again wetting them and stretching them upon a convex block; third, preparing leather lining-bands, one for each half-cover, shaping them to the contour of the said half-covers by wetting and stretching them upon a convex block, leaving them till they are dry, and then tacking a band to the inside of each half-cover along the edge; fourth, sewing the two half-covers together, as set forth.

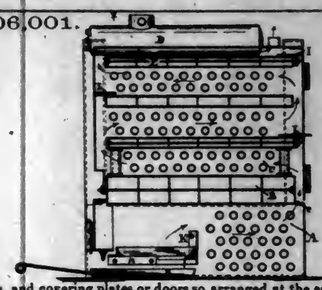
2. The hereinbefore-described method or process of making foot balls, consisting in, first, stretching wet leather gussets upon a flat surface and leaving them thereon till they are dry; second, concaving them by again wetting them and stretching them upon a convex block; third, preparing leather lining-bands, one for each half-cover, shaping them to the contour of the said half-covers by wetting and stretching them upon a convex block, leaving them till they are dry, and then tacking a band to the inside of each half-cover along the edge; fourth, sewing the two half-covers together, and, fifth, lining the cover produced by the junction of the two half-covers with a rubber bladder, inflating the latter, tying its mouth, and finally sewing or lacing up the mouth of the cover, as set forth.

406,000. TACKLE-BLOCK. WILLIAM J. LAMB, Poughkeepsie, N. Y. Filed Jan. 12, 1889. Serial No. 296,147. (No model.)

Claim.—1. The combination, in a tackle-block, of a sheave, a gripping-block support, a gripping-block fixed or non-pivoted on said support and arranged to move in proximity to the sheave, the said support for the gripping-block being pivoted on the tackle-block at a point opposite the gripping-block, whereby the path described by the gripping-surface will be entirely outside of the bearing-surface on the sheave, the parts being constructed and arranged to operate substantially as described.

2. In combination with a tackle-block and a sheave, a lever pivoted upon one edge of the sheave-frame and carrying a gripping-block fixed to its free end and opposite the periphery of the sheave, the lever being arranged to come into contact with the hub of the sheave when the grip is engaged with the rope, substantially as described.

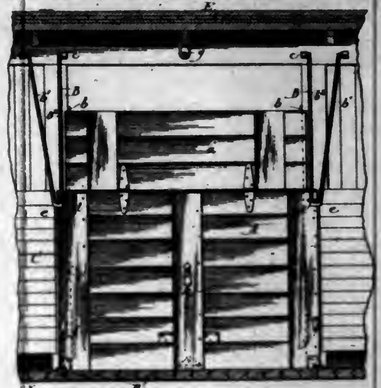
3. A gripping-lever, combined with a block and its sheave, said lever being pivoted upon one edge of the block and arranged across the same on one side of and above a diametrical line on the block, and having also its pivoted end extended to form a short arm of the lever, and the holding-cord o, substantially as described.



4. Combined with a block and its sheave, a pivoted gripping-arm having an extension at its pivoted end adapted to be acted upon by the lifting-rope when said rope is moved out of line, substantially as described.

5. Combined with a block and its sheave, a pivoted gripping-lever having an extension on its pivoted end arranged in the described relation to the rope, and a detachable weight on said end, said weighted end being adapted to be acted upon by the lifting-rope when said rope is drawn out of line to cause the grip to act, substantially as described.

406,001. STEAM-BOILER. WILLIAM MCDONALD, Providence, R. I., assignor of one-half to Charlotte M. Hacker, same place. Filed Dec. 11, 1888. Serial No. 293,281. (No model.)



Claim.—In a sectional boiler, the combination of tubular sections and plain tank-sections, one above another, with their pipe-connec-

406,001.

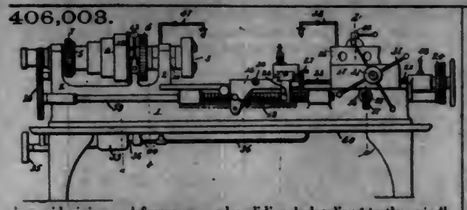
tions, and covering plates or doors so arranged at the ends of the sections in forming rearward and forward passages for the circulation of heat, substantially as described and illustrated in the drawings, and for the purpose specified.

406,002. GRAIN-CAR DOOR. WILLIAM A. MCGUIRE, Chicago, Ill., assignor to the McGuire Manufacturing Company, same place. Filed Nov. 7, 1888. Serial No. 290,238. (No model.)

Claim.—1. The door A, provided with the hooks *f* and having the flaps *a* hinged to its upper edge, in combination with the bent rods B B, connected to the door A, each rod B consisting of an inclined portion b', and a vertical portion b^2, both of said portions b' b^2 being pivotally connected at their upper ends to the frame-work of a car, whereby, when the door A is swung up and caught against the roof of the car, the rods B B will aid in holding the door and the flap in such position, substantially as specified.

2. A grain-car door A, in combination with two bent rods B B, which are connected to the door A, each rod consisting of an inclined portion b' and a vertical portion b^2, and eyes or sockets *c c*, into which the ends of the rods B B are placed, substantially as and for the purpose specified.

3. A grain-car door A, in combination with two bent rods B B, connected to the door A, each rod consisting of an inclined bracing portion b', a vertical portion b^2, and a flattened portion *e*, and eyes or sockets *c c*, connected to the frame-work of the car and into which the ends of the rods B B are placed, substantially as and for the purpose specified.



4. A grain-car door A, in combination with two bent rods B B, connected to the door A, each rod consisting of an inclined bracing portion b', a vertical portion b^2, and a flattened portion *e*, eyes or sockets *c c*, secured to the frame-work of the car and into which the ends of the rods B B are placed, and hooks *f f* on the door A, with which hooks the flattened portions *e e* of the rods B B engage when the door is raised, substantially as specified.

5. A rod for grain-car doors, bent, as shown, to have an inclined bracing portion b' and a vertical portion b^2 and a flattened portion *e*, and having its ends adapted to be hinged to the frame-work of a car, substantially as and for the purpose specified.

406,003. TURRET-LATHE. GEORGE T. REISS, Hamilton, Ohio, assignor to the Niles Tool Works, same place. Filed Feb. 2, 1889. Serial No. 298,440. (No model.)

Claim.—1. The combination, substantially as set forth, of a spindle, a cone-pulley free to revolve thereon and having a frictional clutch-surface, a pinion fast on the cone-pulley, a face-gear free to revolve on the spindle and having a toothed clutch, a back gear engag-

406,003.

ing said pinion and face-gear, and a sliding hub splined to the spindle between the cone-pulley and face-gear and provided with a frictional clutch-surface to engage the frictional clutch-surface of the cone-pulley and with a toothed clutch to engage the toothed clutch of the face-gear.

2. The combination, substantially as set forth, of a spindle, a cone-pulley loose thereon, a pinion fast on the cone-pulley, a back gear, a box for the spindle provided with a collar-groove, a face-gear loose on the spindle between the cone-pulley and box and having a hub-collar engaging said collar-groove, and a sliding hub splined to the spindle between the cone-pulley and face-gear and provided with clutches for engagement with suitable clutches on the cone-pulley and face-gear.

3. In a lathe, the combination, substantially as set forth, of a lead-screw mounted at one side of the lathe-bed and geared to the lathe-spindle, an open-and-shut nut on the lathe-carriage and adapted to engage the lead-screw, a feed-screw mounted on the opposite side of the lathe-bed and geared to the lathe-spindle, an open-and-shut nut on the lathe-carriage adapted to engage the feed-screw, turret-screw mounted at the tail end of the lathe-bed and geared to the feed-screw, and a turret-slide engaging the turret-screw.

4. In a lathe, the combination, substantially as set forth, of a feed-screw mounted at the back of the lathe, an open-and-shut nut on the lathe-carriage, arranged to slide horizontally and adapted to engage such screw, a sliding rod connected with such nut and reaching across the lathe bed and carriage to the front of the carriage, and a handle on said rod at the front of the carriage.

5. In a turret-lathe, the combination, substantially as set forth, of a turret-slide having a downwardly-projecting hub with a pivot-hole for the turret, a turret having a hub fitting and projecting downwardly through said pivot-hole and below said first-mentioned hub and mortised horizontally at such projection, a ratchet-disk secured to the lower end of said turret-hub below said mortise, a turret-clamping-bolt axially disposed in the turret and its hub, and a T-head on the lower end of said bolt with its ears projecting through said mortise and engaging the downwardly-presenting surface of said first-mentioned hub.

6. In a turret-lathe, the combination, substantially as set forth, of a turret-slide, a turret mounted thereon and having ratchet-teeth, a dowel in the turret-slide, adapted to engage dowel-holes in the turret, a pawl to engage said ratchet-teeth, inclines to engage said dowel, and a pawl-block carrying said pawl and inclines and fitted for longitudinal adjustment along the lathe-bed, and devices for adjusting and securing said pawl-block.

7. In a turret-lathe, the combination, substantially as set forth, of a turret-dowel having a T-shaped foot and inclines attached to the lathe-bed and adapted to be engaged by said foot.

8. In a turret-lathe, the combination, substantially as set forth, of a pawl-block arranged to be adjusted along the lathe-bed and provided with a rack, a pinion-shaft journaled in the lathe-bed and fitted with a head for turning it, a pinion thereon engaging said rack, a graduated disk on said shaft, and a clamp engaging said disk.

406,004. WHIP-SOCKET. AMOS SEARLS, Newark, N. J., assignor to the Searls Manufacturing Company, same place. Filed June 4, 1888. Serial No. 276,169. (No model.)

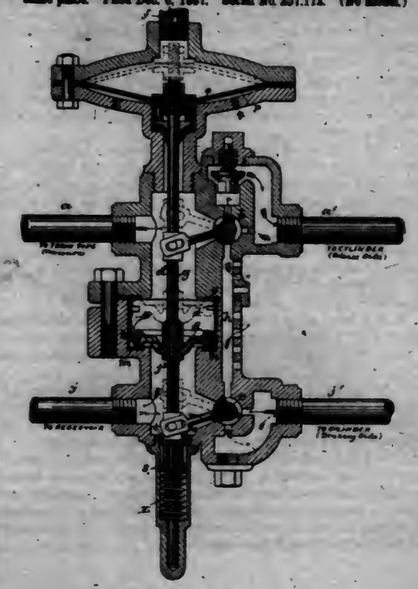
Claim.—1. The combination of a whip-socket barrel provided with an internal mouth piece or lining turned over and attached to the top of the barrel, and one or more springs interposed between said lining and barrel and held thereby, said lining being free and unattached at the lower end and held down by said springs, substantially as set forth.

406,004.

2. The combination of a whip-socket barrel with an internal mouth piece or lining B, provided with a hem turned over the outside of the top of the barrel and held thereon by a cord or wire *c*, and one or more springs C, secured to said lining, substantially as and for the purpose set forth.

3. A whip-socket fastener consisting of a band D, that embraces the socket and forms a bearing for a dash-rail between the socket and the rail, in combination with a screw *n*, attaching the ends through holes *t* and *s* to a dash-rail, and a screw *m*, interposing between the rail and the socket and holding and adjusting the band by holes *u* and P between the dash-rail and the socket, and tightening the band D around the socket and dash-rail by the screw *m*, substantially as set forth.

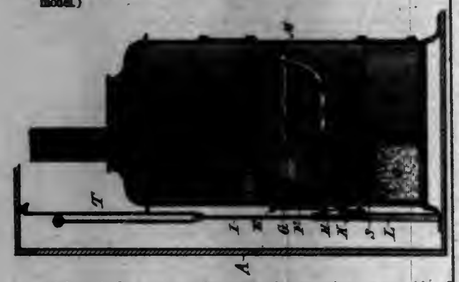
4. A whip-socket fastener consisting of a band provided with holes P and *s*, placed on opposite sides of a longitudinal line through the band, combined with screws *m* and *n*, substantially as and for the purpose set forth.



406,005. BOTTLE-STOPPER. WILLIAM SHEPHERD, London, England, assignor to Arthur George Pead Allt, same place. Filed Aug. 10, 1888. Serial No. 282,490. (No model.) Patented in England Oct. 11, 1884, No. 13,425, and Oct. 9, 1886, No. 12,897.

Claim.—1. A bottle-stopper comprising a stopper proper provided with a flange on its body and with an annular groove near its top, a screw-threaded ring provided with an annular recess in its top, and an elastic band inserted in said recess and groove and uniting said stopper and ring.

2. A bottle-stopper comprising a stopper proper provided with a flange on its body and with an annular groove near its top, a screw-threaded ring provided with an annular recess in its top, and with an outwardly-projecting downturned flange, and an elastic band inserted in said recess and groove and uniting said stopper and ring.



406,006. AUTOMATIC AIR-BRAKE. REINALDO SOLARI, Brooklyn, N. Y., assignor of two-thirds to John W. Howard and David R. Morse, same place. Filed Dec. 6, 1887. Serial No. 257,112. (No model.)

Claim.—1. In the automatic fluid-brake apparatus herein described, the combination of the double-acting brake-cylinder and piston, a valve-piston, or its equivalent, permanently exposed to the train-pipe, and auxiliary storage-reservoir pressures connected with oscillating valves which turn through different degrees of a circle by means of the variations of pressure induced on opposite sides of said valve-piston, a retarding-spring to limit the return movement of said valve-piston, and a check-valve interposed between the charging-passage of the oscillating valve and brake-cylinder port, whereby a predominating train-pipe pressure will actuate the valve-piston to simultaneously admit the pressure to the release side and exhaust the pressure from the braking side of said brake-cylinder, and a predominating auxiliary storage-reservoir pressure will actuate said valve-piston to simultaneously admit pressure to the braking side and exhaust the pressure at the release side of said cylinder, and whereby said pressure, when balanced on the valve-piston in conjunction with said retarding-spring, will retain and hold the same and sever all the ports, as and for the purpose specified.

2. In an automatic brake system, the combination of an oscillating valve, substantially as described, for controlling the charging and exhaust cylinder passages, and with a reciprocating piston or its equivalent connected to impart a rocking movement to said valve through different degrees of a circle by means of the variations of pressure induced on opposite sides of said piston or its equivalent, as specified.

406,007. STOVE FOR RAILWAY-COACHES. ALMON M. SPAULDING, Grand Rapids, Mich. Filed Mar. 9, 1888. Serial No. 266,778. (No model.)

Claim.—1. In a stove, a fire-pot having trunnions at one side of its center of gravity, arms attached to the outer ends of said trunnions, fastenings engaging with said arms and retaining said fire-pot in position, and a cord connected with and adapted to release said fastenings, said cord being continuous throughout the train, substantially as described.

2. In a stove, a fire-pot having one end sustained by trunnions and the other end sustained by detachable fastenings, the latter end being open, in combination with a stationary plate attached to the stove and closing said end when the fire-pot is in a horizontal position, substantially as described.

3. In a stove, a fire-pot having an open end supported upon trunnions, said open end closed by a fixed plate, and a tank, adapted to contain water, located beneath said open end, into which the contents of said fire-pot are discharged when it turns upon said trunnions, substantially as described.

4. In a stove, an ash-pan and water-tank located side by side upon substantially the same level, a fire-pot above the same having trunnions upon which it turns to discharge its contents at one side into said water-tank, and a grated bottom through which the ashes escape into said ash-pan, substantially as described.

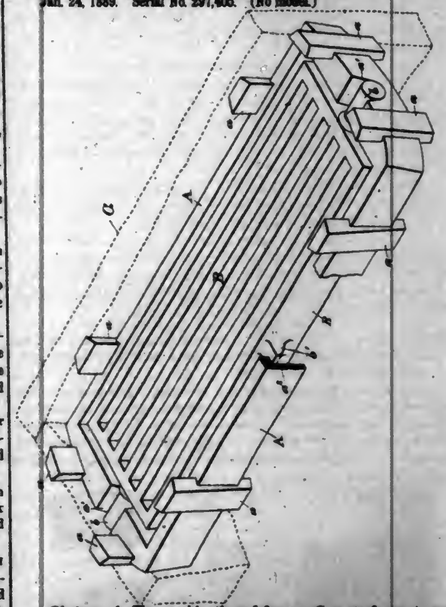
5. In a stove, a fire-pot adapted to turn upon trunnions and discharge its contents, a tank adapted to contain water and receive the contents of said fire-pot, and a cover to said tank supported in place by a chain attached to said fire-pot and adapted to open when said fire-pot turns upon its trunnions, substantially as described.

6. In a stove, a fire-pot having trunnions at one side of its center of gravity, arms attached to said trunnions, and sliding rods supporting said arms and attached to a disk having a rod attached to hold and rotate said disk, substantially as described.

7. In a stove, a disk to which are pivoted rods passing through loops, and supporting-arms attached to a pivoted fire-pot, said disk provided with a stop-pin engaging with a rod pivoted to said disk and resting against the end of the coach, substantially as described.

8. In a stove, a fire-pot having trunnions at one side of its center of gravity, arms attached to the outer ends of said trunnions, fastenings engaging with said arms to sustain said fire-pot in position, and the prop L, attached to the floor or other distant part of the coach and adapted to release said fastenings when said floor or part is crushed inward, substantially as described.

406,008. TIE-BAR CLIP FOR SPLIT SWITCHES. AXEL A. STROM, Austin, assignor to the Strom Manufacturing Company, Chicago, Ill. Filed Feb. 19, 1889. Serial No. 300,397. (No model.)

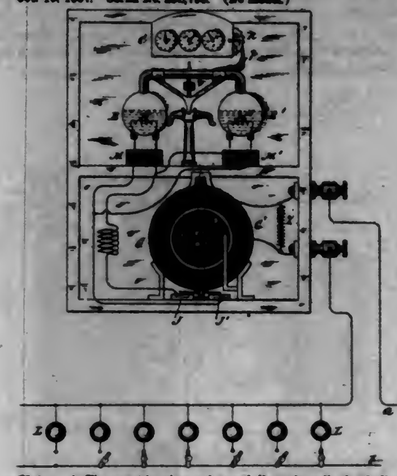


Claim.—1. In combination with a tie-bar C, a clip A, having arms *q*, to be secured at one end of the device to a switch-rail and extend, when so secured, beyond and below the flange of the rail, a base *p*, connecting the arms, and a fixed stud *o*, for pivotally securing the tie-bar C in the clip against removal therefrom when the clip is fastened to and the tie-bar extends underneath the rail, substantially as described.

2. In combination with a tie-bar C, a clip A, having arms *q*, to be secured at one end of the device to a switch-rail and extend, when so secured, beyond and below the flange of the rail, a base *p*, connecting the arms, and a stud *o*, fixed in the clip, and upon which to pivot the tie-bar, whereby, when the tie-bar is adjusted in the clip fastened to a switch-rail and extends underneath the said rail, it is confined against removal by the stud and between the clip and switch-rail, substantially as described.

3. In a clip A, the combination of arms *q*, to be secured at one end of the device to a switch-rail and extend, when so secured, beyond and below the flange of the rail, a base *p*, connecting the arms, and a stud *o*, extending into the clip from and fixed upon the base, substantially as and for the purpose set forth.

4. In combination with a tie-bar C, a clip A, comprising arms *q*, having perforated ears *r*, at which to secure the clip to the web of a switch-rail, and extending from the ears obliquely to conform to the flange of the rail and beyond the latter downward with reference to the rail-flange and below the latter, a base *p*, connecting the arms, and a stud *o*, extending from and fixed upon the base, whereby, when the tie-bar is adjusted in the clip fastened to a switch-rail and extends underneath the said rail, it is confined against removal by the stud and between the clip and switch-rail, substantially as described.



406,009. FIRE-GRATE. HAMLET SUTCLIFFE, Oakland, Cal. Filed Jan. 24, 1889. Serial No. 297,605. (No model.)

Claim.—1. The combination of fire-box C, grate-frame A, and wedges *a*, fitted into grate-frame and resting against the fire-box, substantially as described.

2. The combination of fire-box C, grate-frame A, and wedges *a*, fitted into the grate-frame and resting against the fire-box, and a grate pivoted in and supported by the grate-frame A, substantially as described.

406,010. ELECTRIC METER. ELIHU THOMSON, Lynn, Mass. Filed Oct. 19, 1887. Serial No. 252,793. (No model.)

Claim.—1. The combination, substantially as described, of a liquid-containing receptacle holding a vaporizable liquid, a heating-conductor forming a portion of an electric circuit, and a chamber or tube connected with the space above the liquid for collecting the condensed vapor evolved by the heating action of the current.

2. The combination, substantially as described, in an electric meter, of a receptacle containing a vaporizable liquid, a heating-conductor forming a portion of an electric circuit, and means for indicating or measuring the amount of vaporization.

3. The combination, substantially as described, of a liquid-containing receptacle holding a vaporizable liquid, an electric conductor forming a portion of an electric circuit and immersed in the liquid, and an independent condensing and collecting chamber connected with the space above the liquid, as and for the purpose described.

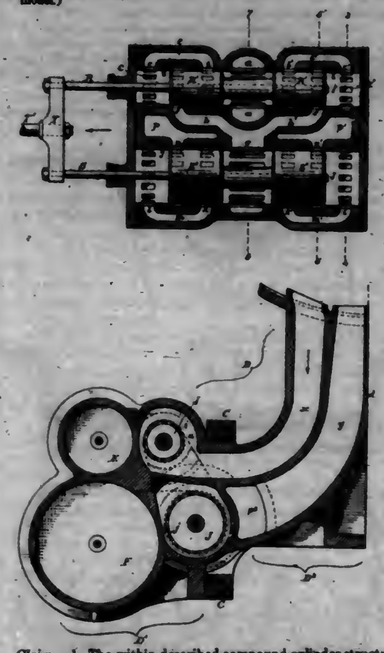
4. A balanced or pivoted liquid-containing receptacle holding a vaporizable liquid and having two liquid-holding chambers connected by a tube above the level of the liquid, in combination with a heating electric conductor.

5. A closed receptacle containing a vaporizable liquid, in combination with a heating electric conductor and an independent vapor condensing and collecting chamber connected with said vapor-space of said receptacle.

6. The combination, with a translating device operated by the heating effects of an electric current, of a transformer, the secondary of which is connected with the translating device, while the two members of the transformer are movable one with relation to the other under the action of the exciting-current.

7. The combination, with an electric meter, of a transformer whose two members are movable with relation to one another for the purpose of changing their inductive relations, one of the coils of said transformer being connected with the meter, while the other connects with the circuit of the current to be measured, as and for the purpose described.

8. The combination, in an electric meter, of a current-governing device operated or controlled by the current to be measured, a heating conductor or coil supplied with the current governed, a receptacle containing a volatile liquid acted upon by the heat developed in said conductor, and means for indicating the amount of vaporization of said liquid, as and for the purpose described.



9. The combination, with a closed receptacle containing a vaporizable liquid, of a heating electric conductor acting on the liquid, and a register or indicating device for showing the amount of liquid evaporated.

10. The combination, substantially as described, of two liquid-containing receptacles connected together and mounted upon a suitable pivot or fulcrum, two heating coils or conductors for said receptacles, and an electric switch operated by said pivoted receptacles, as and for the purpose described.

11. The combination, with a bulb or receptacle sealed and containing alcohol in vapor, of a heating electric conductor, and a second bulb or receptacle connected to the first by a tube opening into the same above the level of the liquid.

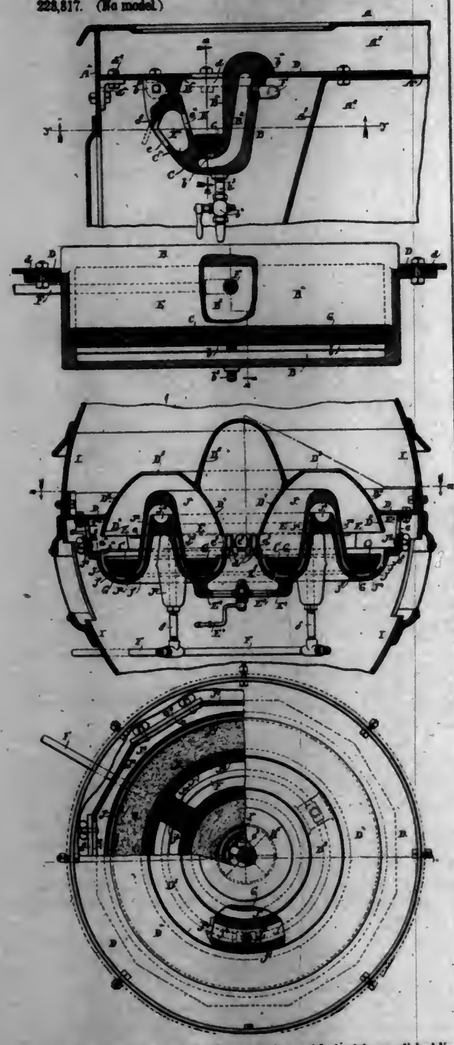
12. The combination of an inducing and induced conductor movable with relation to one another under the influence of alternating currents and having a retractor adjusted as described, to permit the movable member to assume positions where the induced current will be proportional to the square root of the inducing-current, as and for the purpose described.

406,011. COMPOUND LOCOMOTIVE-ENGINE. SAMUEL M. VAUCLAIN, Philadelphia, Pa. Filed Feb. 21, 1888. Serial No. 300,672. (No model.)

Claim.—1. The within-described compound cylinder structure for locomotives, said compound structure comprising a portion on the outer side of the engine-frame and a portion on the inner side of said frame, the portion on the outer side containing the high and low pressure cylinders, situated side by side, and the valve-chest structure for said cylinders, and the portion on the inner side containing the inlet and exhaust passages, which extend up to the smoke-box, so that the structure is capable of being substituted for the usual single-cylinder structure of a locomotive without change of the adjacent structure, substantially as specified.

2. The combination of the valve-stems, each having a valve, with the high and low pressure valve-chests, each having central inlet-chamber, opposite end ports communicating with the cylinder, and two sets of intermediate ports, the induction-ports communicating with the end ports, the eduction-ports of the high-pressure chest communicating with the inlet-chamber of the low-pressure chest, and the eduction-ports of the latter communicating with the exhaust-passage, substantially as specified.

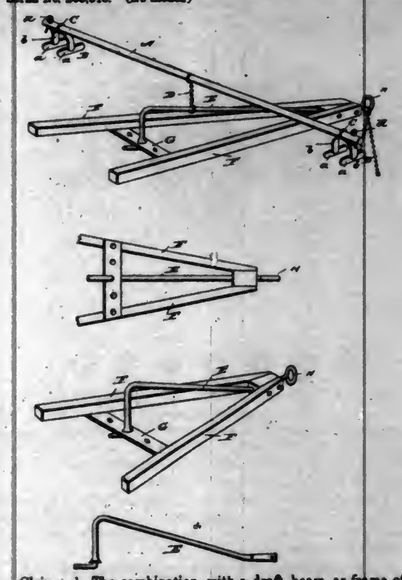
406,012. VALVE FOR COMPOUND ENGINES. SAMUEL M. VAUCLAIN, Philadelphia, Pa. Filed Mar. 22, 1889. Serial No. 304,322. (No model.)



Claim.—1. The combination, in a valve structure for compound engines, of the valve-chest having supply-ports, high-pressure induction and eduction ports, low-pressure induction and eduction ports, and final exhaust-port, with a hollow valve having an internal pas-

sage providing communication between the high-pressure ports and the opposite low-pressure ports, and a passage between the latter and the exhaust-port, substantially as described.

2. The combination, in a compound engine, of the high and low pressure cylinders situated side by side, the valve-chest common to both cylinders and situated at the side thereof, said chest having supply-ports at the ends, a final exhaust-port at the center, high-pressure induction and eduction ports adjoining the steam-supply ports, and low-pressure induction and eduction ports adjoining the final exhaust-port, with a hollow valve having an internal passage connecting opposite high and low pressure ports, and a passage connecting the latter ports and the exhaust-port, substantially as described.



406,013. **BURNER FOR LIQUID FUEL.** WILLIAM VOGEL, Chicago, Ill., assignor, by direct and mesne assignments, to the Vogel Petroleum Heating Company, same place. Filed Feb. 25, 1887. Serial No. 228,817. (No model.)

Claim.—1. A burner for liquid fuel provided with an oil-holding trough or receptacle, the side walls of the burner forming a combustion-chamber above the said oil-holding trough, and a closed passage within the side wall of the said combustion-chamber, said passage communicating at its upper end with an oil-supply pipe and at its lower end with the oil-holding trough, all substantially as described.

2. A burner for liquid fuel provided with an oil-holding trough or receptacle, a casing forming a combustion-chamber above said oil-holding trough, a closed passage in the side wall of said combustion-chamber, connected at one end with an oil-supply and at the other end with the oil-holding trough, and a chamber in the wall of the casing forming a trough for the overflow, said chamber being provided with openings for supplying air to the combustion-chamber, substantially as described.

406,014. **RACK-POLE, &c.** WILLIAM Y. WEST, New Orleans, La., assignor to the A. Baldwin Co., (Limited,) same place. Filed Jan. 8, 1889. Serial No. 296,815. (No model.)

Claim.—1. The combination, with a draft beam or frame of an agricultural implement, of a transverse bar connected therewith and carrying at opposite ends saddles adapted to be applied to the backs of draft-animals, substantially as specified.

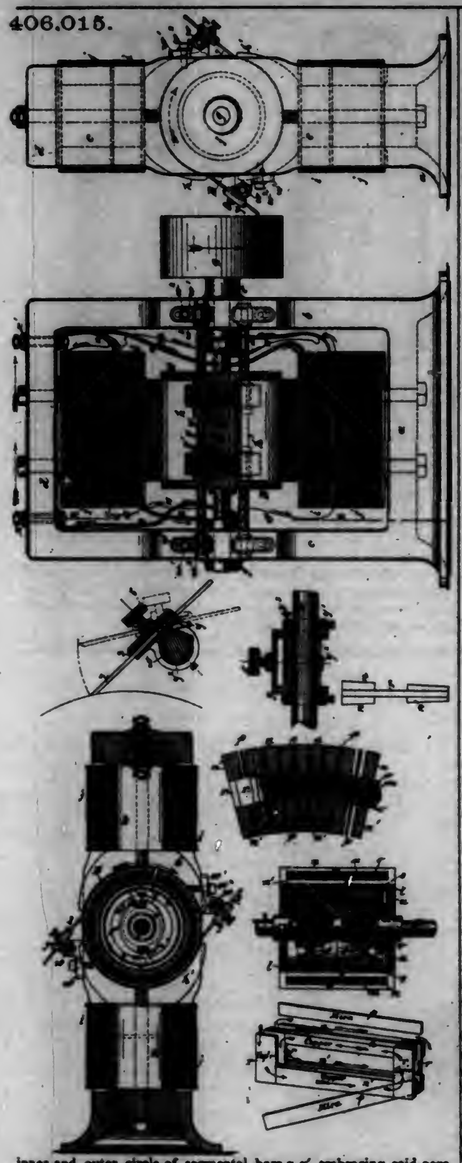
2. The combination, with a draft beam or frame, of a bar or rod secured thereto and having a pitch forwardly, and a transverse bar connected with said frame-bar and carrying saddles to be applied to the backs of draft-animals, substantially as specified.

3. The combination, with the draft-frame of an agricultural machine, of a transverse bar connected therewith and saddles connected to the opposite ends of said bar by swivel-joints, substantially as specified.

4. The combination, with a draft-frame, of the bar E, the saddle-bar A, the chain D, connecting them, and the saddles B, connected to said bar A on opposite sides of the draft-frame, substantially as specified.

406,015. **DYNAMO-ELECTRIC MACHINE.** THOMAS J. WILLSON, Brooklyn, assignor of one-third to Grosvenor P. Lowrey, New York, N. Y. Filed Jan. 9, 1888. Serial No. 260,256. (No model.)

Claim.—1. The combination of the field-magnet, a commutating-armature, and brushes bearing upon the periphery of the armature within the polar gaps.



2. The combination, with *d* commutating-armature, of a field-magnet having two pole-pieces embracing the armature on opposite sides, and commutator-brushes bearing upon the portion of the periphery of the armature exposed in the gaps between the pole-pieces.

3. A dynamo-electric machine having a commutating-armature and a field-magnet constructed to leave the entire length of the exterior of the armature exposed on opposite sides between the pole-pieces, and brushes arranged to bear against the exposed periphery of the armature in the polar gaps.

4. The combination, with a commutating-armature consisting of segmental bars arranged spirally around a core, and field-magnets having polar ends radially approaching the exterior circumference of said armature on opposite sides, of brushes bearing directly on the external peripheral segments of said commutating-armature at the exposed portions between the radially-approaching magnet-poles, substantially as herein set forth.

5. In a Gramme armature, the combination, with a core, of an

406,015.

inner and outer circle of segmental bars *a a'*, embracing said core, with their ends recessed or scarfed, and with cross connecting-pieces *r* let into said recesses and soldered or secured therein, substantially as shown and described.

6. A Gramme armature constructed with an annular core, exterior and interior metal strips extending longitudinally of the axis of the armature, plates of insulating material alternated with said strips, and radial metal strips connected at their inner ends to the inner strips and at their outer ends to the outer strips, the respective strips being coupled in spiral order, and the radial strips being of less width than the longitudinal strips, whereby they are held out of contact with and insulated from one another, substantially as set forth.

7. In a dynamo-electric machine, field-magnets made in the form of a rectangle or frame cast in one integral piece, with the polar limbs made separate and bolted on the ends of the integral frame and directed inward, with the armature-shaft extending transversely and centrally through the sides of the frame, and the armature mounted on the middle thereof in the center of the integral frame between the attached polar limbs, substantially as herein shown and described.

8. In a dynamo, the combination, with a field-magnet, of a commutating-armature arranged with its axis coincident with the plane of the field-magnet, whereby the portions of the periphery of the armature exposed within the gaps between the pole-pieces are on opposite sides of the plane of the field-magnet, and commutator-brushes bearing upon the periphery of the armature within the polar gaps, whereby the brushes are conveniently accessible upon the exterior of the machine.

9. The combination, with an annular armature, of an expansible clutching-sleeve within the same, an armature-driving shaft concentric to said sleeve, a wedging-screw connection between said shaft and expansible sleeve, acting to tighten or expand said sleeve by the forward rotation of the shaft within the armature, and a friction-clutch between the shaft and the sleeve acting to slip in the direction of said forward rotation of the shaft and to catch in the reverse direction, substantially as and for the purpose set forth.

10. In a dynamo-electric machine, the combination, with an armature and its driving-shaft, and a wedging-screw connection between the shaft and armature, constructed to tighten by a forward rotation of the shaft within the armature, of the disk *v*, secured to the shaft, and the frictional pawls *u*, pivoted thereon and engaging the armature in the reverse direction, substantially as shown and described.

11. In a dynamo-electric machine, the combination of brush-holding bars arranged parallel with the armature-shaft, with brushes mounted thereon to bear upon the commutating peripheral surface of the armature, and adjustable supports for said bars, substantially as shown and described.

12. In a dynamo-electric machine, a brush-carrier extending parallel to the shaft of the armature and adjacent and exterior to the periphery of the armature, with a brush mounted on said carrier and bearing upon the periphery of said armature, substantially as shown and described.

13. The combination, with the supporting-frame, of the brush-holding bars *w*, brushes mounted on said bars, and brackets *w'*, adjustably supporting each end of the bar on the frame, substantially as shown and described.

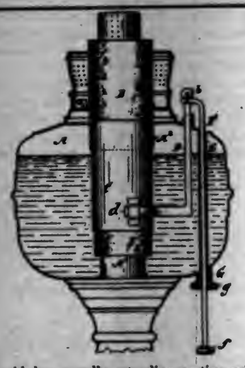
14. The combination of the brush-carrier extending parallel with the armature-shaft and external to the periphery of the armature, with angularly-adjustable brushes mounted on said carriers and bearing directly on the armature, substantially as set forth.

15. The combination, with the fixed frame *a b c d*, of the bars *w*, extending entirely across the frame and secured thereto at each end and disposed parallel with the armature, with brushes mounted thereon and bearing on the commutating-surface, substantially as shown and described.

16. The combination, with a commutating-armature, of brush-holding bars on opposite sides of the armature and extending parallel with its axis, and brushes mounted thereon bearing upon the periphery of the armature and adjustable longitudinally on said bars, in order to bear upon different portions of the length of the armature, substantially as set forth.

17. In a dynamo-machine, the combination of a brush-supporting bar extending parallel with the armature-shaft external to the armature and in electrical connection with the brushes and attached to the frame, with the circuit-wires of the field-magnets extending to and from said bar, substantially as shown and described.

18. In commutator-brush adjusters, the combination, with a brush-carrier adjustable tangentially in relation to the commutating-surface, of a brush mounted on said carrier, and having a radial adjustment to and from the commutating-surface, substantially as set forth.



19. In commutator-brush adjusters, the combination, with an axial bar adjustable tangentially in relation to the commutating-surface, of a movable brush mounted on said axial bar and rotatively adjustable thereon to and from the commutating-surface, substantially as herein shown and described.

406,016. **WICK-RAISER FOR LAMPS.** GEORGE W. WOODWARD, Brooklyn, N. Y. Filed Aug. 16, 1888. Serial No. 282,862. (No model.)

Claim.—1. In a central-draft lamp, the combination, with a wick-tube, of a wick-holder secured to a wick, a sliding rod detachably secured to the wick-holder and extended upwardly above the reservoir, a sliding rod secured to the upper end of the first-named rod by means of a thread and nut and extended downwardly through the reservoir below the same, and a tube through the reservoir, through which said downwardly-extending portion extends, substantially as specified.

2. In a central-draft lamp, the combination, with a wick-tube, of a wick-holder secured to the wick, a sliding rod detachably secured to the wick-holder and extending above the lamp-reservoir, a sliding rod secured to the upper end of the first-named rod and extended downward through the reservoir, and a finger-piece below the reser-

406,016.

voir surrounding said downwardly-extending portion, substantially as specified.

406,017. LABEL ATTACHMENT FOR BOTTLES. HARLOW E. WOODWARD, Boston, and SAMUEL R. KING, Cambridge, Mass. Filed Jan. 24, 1889. Serial No. 297,830. (No model.)

Claim.—1. The herein-described label-containing attachment for druggists' dispensing-bottles, &c., consisting of a casing adapted to be secured permanently to the outside of a bottle or receptacle for the purpose of containing a number of labels, and having the upper portion of its front side left open to form an aperture *g*, through which said labels are introduced and withdrawn, in combination with a guard or flange *m*, placed over the opening *g* and adapted to prevent the labels from falling out when the bottle is tipped up and protect them from any liquid flowing down from the mouth of the bottle, substantially as set forth.

406,017.

2. A label-containing casing B, adapted to be secured permanently to the outside of a bottle or other receptacle and having the upper portion of its front side left open to form an aperture *g*, for the introduction and withdrawal of the labels, in combination with the guard or flange *m*, placed over said aperture *g*, and the vertical slot *h* in the front side *f*, all operating substantially in the manner and for the purpose described.

3. The label-containing casing B, permanently secured to the bottle, having the upper portion of its front side left open to form an aperture *g*, for the introduction and withdrawal of the labels, in combination with the guard or flange *m*, placed over said aperture *g*, the slot *h* in the front side *f*, and the pusher-plate or ejector *i*, placed within the casing B and provided with a projection or handle *l*, extending outward through the slot *h*, all operating substantially in the manner and for the purpose set forth.

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE WEST.

Decided June 14, 1889.

1. INVENTION—MECHANICAL SKILL.

Where it appears that plackets in drawers have been bound in substantially the same manner as the applicant's alleged invention, it is not invention to extend that idea and make the binding include the opening for the wrist or neck or body in a shirt or other garment, or to slightly or obviously modify the manner in which the binding is turned, or to omit a cord from the binding which is simply a strengthener, or to merely prolong the binding itself.

2. SAME—FORMER DECISIONS FOLLOWED.

The cases of *Smith* v. *Nichols* (21 Wall., 112) and *Hollister* v. *Benedict Manufacturing Co.* (113 U. S., 59) followed in this respect.

APPEAL from Examiners-in-Chief.

SHIRTS.

Application of Marshall O. West filed November 30, 1888, No. 292,322.

Mr. W. X. Stevens for the applicant.

MITCHELL, *Commissioner:*

The claims appealed are as follows:

1. The combination of a garment having an opening and a placket at one side thereof, and a binding secured continuously around the said opening and placket and joined end to end by a continuous line of stitches, substantially as shown and described.

2. The combination of a garment having an opening and a placket at one side thereof, and further having a band comprising two or more thicknesses of cloth secured at one edge around the said mouth of the garment and ending at the placket, and a binding secured continuously around the outer edges of the band and placket by a continuous line of stitches.

The references cited are patents to Taylor, September 23, 1873, No. 143,198; Lubin, July 4, 1882, No. 260,694; Neustadter, May 24, 1881, No. 242,023; Hall, January 16, 1883, No. 270,663; McDonald, June 26, 1883, No. 280,056, and Smith and Paul, August 25, 1885, No. 325,126.

The Examiners-in-Chief held that the references cited in bar were pertinent, and that applicant's alleged invention indicated nothing but a double use of what was there shown, and involved only a well-known and obvious expedient.

Applicant shows and claims a *continuous* binding for a shirt or other garment, extending in one instance across the side placket or slit and around the front and back flaps, in another across the neck-placket and around the neck, and in a third across the wrist-placket and around the wrist. An "all-around" binding, which includes the placket, seems to be the thing contemplated. The patent to McDonald shows drawers stayed by the binding in precisely this way, so far as the placket is concerned, and the other references show, as the Examiners-in-Chief say—

that it is common to use binding where it will do the most good, although it is not shown that shirts have been finished with all-around binding.

Applicant insists that McDonald's binding is not an anticipation of his invention, inasmuch as that binding—

is turned under at its edges in a manner that would be bungling and totally impracticable in a shirt, and it is not a simple binding, but is a box to contain a cord.

He contends, furthermore, that it ends at the waist-band and does not extend around the mouth of the opening, and that the other references cited are equally inapplicable to his case. In view of the fact, however, that the gist of applicant's alleged invention is simply the "all-around" binding, I am unable to see the force of his objections to the relevancy of the patents cited. A slight and obvious modification of the manner in which the McDonald binding is turned, an omission of the cord, which is simply a strengthener, and a mere prolongation of the binding itself would constitute the identical invention claimed. These changes are such as would naturally occur to any seamstress who desired to accomplish the object sought by applicant—a continuous all-around binding—and do not involve invention. Applicant only accomplishes to a greater extent what has before been accomplished by those who have preceded him. In so far as it goes, the McDonald patent, for instance, shows that plackets have been bound in substantially the same manner. To extend that idea and make the binding include the opening for the wrist or neck or body cannot be said to call for anything more than the mere exercise of the will in adapting a well-known means to a proposed end, or the display of the expected skill of the calling.

Says the court in *Smith* v. *Nichols*, (21 Wall., 112:)

But a mere carrying forward or new or more extended application of the original thought, a change only in form, proportions, or degree, the substitution of equivalents, doing substantially the same thing in the same way by substantially the same means with better results, is not such invention as will sustain a patent.

The idea in this case—as in the case of *Hollister* v. *Benedict Manufacturing Co.* (113 U. S., 59)—

seems not to spring from that intuitive faculty of the mind put forth in the search for new results or new methods, creating what had not before existed or bringing to light what lay hidden from vision; but, on the other hand, to be the suggestion of that common experience which arose spontaneously and by a necessity of human reasoning in the minds of those who had become acquainted with the circumstances with which they had to deal. * * * It is but the display of the expected skill of the calling, and involves only the exercise of the ordinary faculties of reasoning upon the materials supplied by a special knowledge and the facility of manipulation which results from its habitual and intelligent practice, and is in no sense the creative work of that inventive faculty which it is the purpose of the Constitution and the patent laws to encourage and reward.

In view of these considerations, the decision of the Examiners-in-Chief is affirmed and the appeal denied.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Eastern District of Missouri, Eastern Division.

HUBER *et al. v.* N. O. NELSON MANUFACTURING COMPANY.

Decided May 25, 1889.

1. LIMIT OF POWER OF COMMISSIONER OF PATENTS UNDER SECTION 4887 REVISED STATUTES OF THE UNITED STATES TO ISSUE LETTERS PATENT FOR AN INVENTION PREVIOUSLY PATENTED IN A FOREIGN COUNTRY.

Section 4887 of the Revised Statutes of the United States so limits the power of the Commissioner of Patents that where an invention has been patented in a foreign country he cannot lawfully issue an American patent for the same invention for a term to extend beyond the actual duration of the life of the foreign patent.

2. SAME—AN AMERICAN PATENT CANNOT BE LAWFULLY ISSUED AFTER THE LAPSE OF A FOREIGN PATENT FOR THE SAME INVENTION.

Letters Patent of the United States granted after a foreign patent for the same invention had lapsed and become null and void by reason of the non-payment of a stamp duty, *Held*, granted without authority of law and void.

3. LIMITATION OF A UNITED STATES PATENT UNDER SECTION 4887.

The termination of a foreign patent prior to the time specified on the face of the grant by the failure of the patentee to comply with some requirement of the foreign law has the effect of terminating a subsequently-issued American patent for the same invention.

4. REISSUED LETTERS PATENT—INADVERTENCE, ACCIDENT, AND MISTAKE—SECTION 4916 REVISED STATUTES OF THE UNITED STATES.

A patent for an invention cannot be reissued for the mere purpose of enlarging the claim, unless there has been a clear mistake inadvertently committed in wording the claim.

5. SAME—DECISION OF COMMISSIONER OF PATENTS NOT FINAL.

A finding of the Commissioner of Patents as to an original patent being inoperative by reason of inadvertence, accident, or mistake may be reviewed in a suit for infringement, at least to the extent of determining whether as a matter of law what was described and alleged to be a mistake was such a mistake as will warrant a reissue.

6. SAME.

Where an applicant, desiring to secure a patent on a combination of old mechanical devices, included a certain element in each claim because he thought it necessary to the usefulness of the machine as a whole, and after the grant of his patent another patent for a similar machine was granted with claims which he thought broader than his own, and in order to invalidate said second patent the first patentee applied for and obtained a reissue with claims so broad that they substantially claimed as a separate device one of the original elements which was old, *Held* that there had been no such inadvertence, accident, or mistake as to warrant a reissue and that said broadened claims were void.

STATEMENT OF THE CASE.

This was a bill filed to restrain the infringement of Letters Patent No. 260,232, issued June 2, 1882, to Henry Huber, assignee of Peters and Donald, as well as to restrain the infringement of Reissued Letters Patent No. 10,826, issued April 19, 1887, to James E. Boyle. Both patents are for improvements in sanitary water-closets.

Huber is owner of Patent No. 260,232, and sole licensee under Reissued Letters Patent No. 10,826.

Mr. Paul Bakewell and *Mr. Arthur S. Brown* for the complainants.

Messrs. Taylor & Pollard and *Mr. Benjamin F. Rex* for the defendants.

THAYER, *J.:*

This case has been elaborately argued. Following the course that was pursued by counsel in the argument, the first question for consideration is whether Letters Patent No. 260,232, issued to Henry Huber as assignee of Peters and Donald, are valid.

The facts in the light of which that question must be determined are not disputed. Peters and Donald are residents of Great Britain. They secured a patent in England on April 7, 1874, for the same invention covered by American Letters Patent No. 260,232. On April 7, 1881, the English patent, by virtue of English laws, became null and void on account of the failure of the patentees to pay the stamp duty of £100 which became due on the patent on that day. On November 29, 1881, they filed an application for a patent for the same invention in the United States, and a patent was subsequently granted to Henry Huber as their assignee on June 27, 1882. Peters and Donald appear to have assigned all their interest in the invention for a nominal consideration to J. E. Boyle on the 27th of October, 1881, some (6) months after the English patent had lapsed and become void, and Boyle in turn assigned his interest to Huber, November 26, 1881. Can a patent issued under such circumstances be sustained as a valid grant?

The precise question, so far as I am aware, has never been decided in a case arising under the twenty-fifth section of the act of July 8, 1870, now section 4887 Revised Statutes of the United States. In several cases, however, where a foreign patent had been issued for a given term expressed on the face of the grant, but with a privilege under the foreign law of being extended for a further period, the question has arisen whether the life of the subsequent American patent was limited by the term expressed on the face of the foreign patent in force when the American patent was issued, or whether the American patent continued during the actual existence of the foreign patent, the same having been extended or renewed. (*Reissner* v. *Sharp*, 16 O. G., 355; *Bate Refrigerating Co.* v. *Gillett*, 22 O. G., 1205; 13 Fed. Rep., 553; *Gramme Electrical Co.* v. *Arron & Hochhausen Electrical Co.*, 25 O. G., 193, 17 Fed. Rep., 838.)

In another class of cases the question has arisen whether the termination of a foreign patent prior to the time specified on the face of the grant by the failure of the patentee to comply with some requirement of the foreign law has the effect of terminating a subsequently-issued American patent for the same invention. (*Paillard* v. *Bruno*, 38 O. G., 900, 29 Fed. Rep., 864: *Bate Refrigerating Co.* v. *Gillett*, 40 O. G., 1029, 31 Fed. Rep., 809; *Holmes Electrical Protective Co.* v. *Metropolitan Burglar Alarm Co.*, 28 O. G., 1189, 21 Fed. Rep., 468.)

The decisions of all the circuit courts in the cases above mentioned proceeded consistently upon the theory first outlined by Mr. Justice CLIFFORD in *Henry* v. *Providence Tool Co.*, (14 O. G., 855, 3 Barn. & Ald., 501,) a case in which the Court was dealing with an American patent granted after an English patent that had been extended for 4 years after its expiration by special order of the crown. The theory thus outlined was, in substance, that every American patent ought to run for a definite period that may be ascertained as soon as the patent issues, and that Congress did not intend by section 4887 of the Revised Statutes that patents should be granted for an uncertain period. In accordance with that view it was held, in substance, in *Henry* v. *Providence Tool Co.*, and in the subsequent decisions, that the life of an American patent, subject to the provisions of section 4887, is limited by the term expressed on the face of the prior foreign patent having the shortest term, and that the existence of the domestic patent when issued is not affected by any events that subsequently shorten or prolong the life of the foreign patent.

Three of the cases above cited were expressly overruled by the United States Supreme Court in *Bate Refrigerating Co.* v. *Hammond et al.*, (46 O. G., 689, 129 U. S., 151,) and, in my judgment, the decision in that case overturns as well the principle on which the other circuit court decisions were predicated.

The Supreme Court has clearly discarded the doctrine that an American patent must necessarily have a fixed term which may be definitely ascertained at the time Letters Patent are granted by holding (as in the cases cited) that the duration of an American patent is dependent upon circumstances that affect the duration of the foreign monopoly. Thus the Court say:

> Under section 4887, although * * * the United States patent may on its face run for 17 years from its date, it is to be so limited by the courts as matter to be adjudicated on evidence *in pais* as to expire at the same time with the foreign patent.

And again:

> Under this view the time of the expiration of the foreign patent may be shown by evidence *in pais* whether the record of the foreign patent itself shows its duration, or other proper evidence, and it is no more objectionable to show the time of the expiration of the foreign patent by giving evidence of extensions such as these in the present case, and thus show the time when by virtue of such extensions the United States patent will expire.

In accordance with such views the court held that although an American patent had been granted subsequently to the issuance of a Canadian patent, which on its face purported to be a grant for the period of 5 years, yet that the American patent did not expire at the end of 5 years limited, inasmuch as the patentee, in compliance with Canadian law, obtained an extension of the foreign patent for two additional terms of 5 years each after the grant of the American patent. The arguments used in the course of that decision lead logically to the conclusion that United States Letters Patent issued subject to the provisions of section 4887 remain in force no longer than the foreign patent having the shortest term; that the life of the domestic patent is measured by the actual duration of the foreign patent, and may be abridged as well as lengthened by circumstances which operate under the foreign law to abridge or lengthen the foreign monopoly.

When it is conceded that it is not essential that the life of an American patent shall be absolutely fixed at its inception, as by the term expressed on the face of the foreign grant having the shortest term, but may extend beyond that period in consequence of the extension of the foreign patent by acts *in pais* done by the patentee in compliance with the foreign patent law, that is a concession that the duration of the domestic patent is dependent in one respect on the life of the foreign patent, and if dependent upon it in one respect it ought to be regarded as dependent upon it in all respects. At all events, if acts done by the patentee in conformity with the foreign law operate to extend the foreign patent beyond the term specified on the face of the original grant, and thereby to prolong the American patent, by parity of reasoning an omission to do acts required by the foreign law which works an absolute forfeiture of the foreign grant ought to extinguish the domestic patent.

No valid reason can be assigned, I apprehend, why the omission of acts required to be done by the foreign law in order to preserve the life of the foreign patent should have no effect on the duration of an American patent issued under section 4887 so long as acts done by the patentee in compliance with the foreign law are allowed to give the American patent a duration that it would not otherwise have. The whole controversy seems to hinge on the question whether the term of the domestic patent is fixed at its inception by the term expressed on the face of the shortest foreign patent, or whether the life of the American patent may be to an extent uncertain and is subject to contingencies affecting the life of the foreign patent. The Supreme Court of the United States appears to have adopted the latter view. It follows, of course, that if the true construction of section 4887 is that a patent subject to its provisions becomes void when the foreign patent lapses—in other words, if the life of the domestic patent is dependent upon that of the foreign patent—then the Commissioner of Patents has no authority under section 4887 to issue American letters after the foreign patent has ceased or determined.

It would hardly be contended, I suppose, that the Commissioner of Patents would be authorized to grant a monopoly of an invention after an event has occurred that in law determines the duration of the monopoly, and which event, if it had occurred after the grant was made instead of before, would at once have rendered the same void.

Commissioner Fisher in the case of *Mushet*, (2 Com. Dec., 106,) shortly after the passage of the act of July 8, 1870, held that section 4887 was intended to allow foreign inventors to secure a monopoly of their inventions in this country after they had been patented abroad, *but only for so long a period as the foreign monopoly continued*, and that to a casual reader would seem to be the obvious purpose of the statute. The last clause of the section—

> but every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent, &c.—

presupposes, as I think, that there is a foreign patent *in force when the American patent issues*, the actual existence of which foreign patent is to determine the duration of the domestic patent. If there is no such foreign patent in force when the American patent issues, but a foreign patent has been theretofore granted for the invention and it has lapsed and become void, there is no authority in law, in my opinion, for the American grant.

The result is that the Peters and Donald patent is adjudged to be void.

Second. The next question concerns the validity of reissued Letters Patent No. 10,826, issued to James E. Boyle, April 19, 1881, and the facts on which that controversy depends are substantially undisputed. The original patent on which the reissue was obtained was numbered 291,139, and was dated January 1, 1884. In the construction of the flushing apparatus or water-closet covered by the original letters Boyle, the inventor, employed what is commonly called an "injector" to exhaust the air confined between two traps

located beneath the bowl or seat of the "flushing apparatus." The apparatus was so arranged that when in use water falling through a pipe from the water tanks or reservoir into the bowl passed by the mouth of the "injector," which was connected by a pipe with the confined air-chamber between the traps, and by the operation of a well-known principle tended to exhaust the air and to create a vacuum in such chamber, the purpose of creating a vacuum being to induce a more powerful outflow of water from the bowl through the traps and into the soil-pipe by the aid of atmospheric pressure on the surface of the water in the bowl.

The idea of constructing a water-closet or flushing apparatus with double traps underneath the seat and a confined air-chamber between the same, from which the air might be withdrawn when the closet was used, so as to induce a more powerful outflow, was not novel. The same method of construction was shown in the Peters and Donald patent before mentioned; but Peters and Donald employed a different device to exhaust the air between the traps. Although injectors and the principle upon which they operate were well known, and although they were in use for various purposes, it may be conceded that Boyle was the first to employ them in the construction of a flushing apparatus or water-closet. Being an old device, he could not claim the injector, independently or otherwise, than in connection with other devices forming a part of his improved sanitary water-closet. The first and most important claim in the original Letters Patent was for—

> A flushing apparatus consisting of a reservoir-tank, a flushing-chamber adapted to be filled therefrom, a valve controlling the admission of water from said tank to said chamber, a suction-injector arranged beneath the outlet from said chamber, a flushing-pipe leading from said injector, and a suction or air pipe communicating with said injector, all combined * * * substantially as set forth, whereby the water in escaping from said chamber into the flushing-pipe traverses said injector and sucks air from said suction-pipe.

It will thus be seen that the injector was 1 of 6 elements in the combination covered by the first claim of the original Letters Patent, No. 291,139.

On January 21, 1885, Boyle made application for a reissue, stating in substance in his application therefor that his patent was "inoperative to protect the invention intended to be covered by it," because the principal claims in said patent were defective or insufficient, in that they appear to be limited to combinations embodying the flushing-chamber as an essential element, whereas that chamber was not essential to his invention in its generic features; that he believed he had introduced a new principle for operating double-trapped siphon-closets—namely, that of producing a vacuum by causing falling flushing-water to act as an injector; but "that, through inadvertence or mistake of judgment, his claims were drawn with less breadth than his specifications, and did not, as they should, cover broadly the application of such principle;" that "such inadvertence or mistake arose by, and in consequence of, a misunderstanding between the inventor and his patent solicitor," and by reason of the inventor's want of familiarity with the technical meaning of the language used in patent claims.

It is admitted that the idea of obtaining a reissue was suggested by the granting of Letters Patent No. 308,358, to Frank B. Hanson, under date of November 25, 1884, for an improvement in water-closets, which latter patent by one of its claims covered a flushing apparatus, the same substantially as that described in the first claim of the Boyle patent above set forth, omitting only the "flushing-chamber."

Boyle's sole purpose in asking for a reissue was confessedly to eliminate the "flushing-chamber" as a constituent element of the combination covered by certain claims of his original patent, particularly the first claim. In other words, he desired to recast his claims, so as to obtain a patent for a flushing apparatus like that described above in the first claim, *minus the flushing-chamber*.

A reissue was eventually granted in accordance with such desire. A claim was allowed in the reissued letters for—

> A flushing apparatus * * * consisting of the combination of a reservoir-tank, a flushing-valve controlling the outlet thereof, a flushing-pipe for conveying water therefrom to the bowl of the closet, a suction-injector arranged in connection with said pipe, and to be traversed by the descending flushing-water, and a suction-pipe in connection with said injector, whereby the water in flowing from said tank downward through the flushing-pipe traverses said injector and sucks the air from said suction-pipe.

The effect was clearly to expand the claims of the original patent by as much as the addition of the flushing-chamber to the combinations claimed in the original patent had served to limit them. (*Pattee Plow Co.* v. *Kingman*, 129 U. S., 294.)

Notwithstanding the expansion of the claims in the reissue, it is strenuously insisted that the main feature of Boyle's flushing apparatus (that which was essentially novel) consisted in the use of an injector operated by falling flushing-water to pump air from between the two traps; that such fact was clearly shown and commented upon in the original specification; that the flushing-chamber was not essential to the operation of that device, a single-reservoir tank being sufficient for that purpose; that by inadvertence or mistake a non-essential limitation was put upon the claims of the original patent that covered the injector device; that in consequence thereof the original patent was inoperative to fully secure the invention intended to be claimed, and that the patent was for such reasons properly reissued, it being a case where the claims have simply been altered to cover more accurately the invention described in the original specification.

Some of these propositions require careful consideration; and in the first place it will be well to understand clearly what is meant by the assertion that the original patent was "*inoperative to protect the invention intended to be covered* by it."

The original patent certainly protects the flushing apparatus that was claimed as a whole in the first claim and carefully described in the drawings. It also protects all the combinations claimed in the several claims of the original patent. It was not necessary to change a word in the specification or alter a line in the drawing to fully secure the apparatus so claimed, and it appears that that was the identical flushing apparatus or water-closet which the patentee intended to manufacture and that his licensee is now manufacturing. It cannot be said, therefore, that the original patent was "*inoperative and invalid*" in the sense that what the patentee claimed and intended to manufacture he cannot hold in consequence of the original specifications being either "defective or insufficient." In the light of these facts, when the patentee asserts that the original patent was "inoperative," no more is meant than that a particular combination of parts might have been claimed originally (and possibly would have been allowed) that was not claimed, and that the original patent was inoperative to protect that *particular combination* because no right to protection was asserted.

Now, even conceding for the purpose of the decision that the original patent was "inoperative" in the sense in which that word is used in section 4916 of the Revised Statutes, which authorizes a reissue, the question remains whether the failure of the inventor to claim what the original patent does not protect, because it was not claimed, was due "to inadvertence, accident, or mistake" in the sense of the statute.

All of the evidence that was before the Commissioner tending to show inadvertence or mistake (such as the affidavit of the inventor and his solicitor and other documents) was offered by the complainants in the present case, and was supplemented by some additional testimony.

Under such circumstances I understand the law to be that the court may review the finding of the Commissioner on the point that the original patent was inoperative by reason of inadvertence and mistake, at least to the extent of determining whether, as a matter of law, what was described and alleged to be a mistake is such a mistake as will warrant a reissue. (*Miller* v. *Brass Co.*, 104 U. S., 355; *Leggett* v. *Avery*, 101 U. S., 256; *Mahn* v. *Harwood*, 112 U. S., 359; *Coon* v. *Wilson*, 113 U. S., 277; *Turner & Seymour Co.* v. *Davis Co.*, 111 U. S., 319.)

In his affidavit filed with the Commissioner, Mr. Frazer, the solicitor who obtained Boyle's original patent as well as the reissue, describes the mistake alleged to have been committed by him and the patentee as tersely, perhaps, as it is anywhere described. He says:

> Deponent clearly understood that the invention in question introduced a new principle in water-closet flushing apparatus—that of exhausting the air by means of an injector—and so described the invention in the specification; but that in drawing the claims he inadvertently incorporated the flushing apparatus as an element therein, *being at the time under the impression the said flushing-chamber was essential to the operation of the invention, whereas, in fact, the said chamber is essential only to the operativeness of the device for producing the afterwash for refilling the bowl, which devices are claimed specifically in claim 4 of said patent.*

It will be observed that the mistake thus described by Mr. Frazer consisted in his being under the impression when he drew the claims of the original patent that—

> The flushing-chamber was essential to the operation of the invention, whereas it was essential only to the operativeness of the devices for producing the afterwash.

This statement is a little obscure, because he does not explain whether by the use of the word "invention" in the paragraph quoted he means the injector device only, or the flushing apparatus considered as a whole. I take it for granted, however, that Mr. Frazer did not use the word "invention" in the restricted sense first mentioned, and would not be so understood.

He is evidently an expert of too much experience to assert that he ever acted for a moment under the mistaken impression that it was necessary to employ a flushing-chamber as well as a "water-tank" in order that the falling flushing-water traversing the injector might operate to suck air from between the two traps, and that was the sole function of the injector device. Drawing No. 6 attached to the original patent, and Mr. Frazer's explanation of the purpose of that drawing, contained in the original specification, shows that he clearly understood that the falling flushing-water traversing the injector would perform its function of pumping air from between the traps equally well whether the water proceeded from a reservoir having one compartment or a dozen, and that fact was obvious to an ordinary observer who had any knowledge of the principle upon which an injector acts. Therefore, in the paragraph quoted Frazer must be understood as asserting merely that he incorporated the flushing-chamber as an element in the several combinations claimed in the original patent, because he desired and intended to describe and claim an operative flushing apparatus or water-closet—that is to say, one that would do the work required of such an apparatus and prove a marketable invention.

It is manifest from other statements made by Mr. Frazer in the course of his testimony that, in his opinion, a flushing apparatus minus the "flushing-chamber," with its attendant devices for securing an afterwash, would be practically useless; that some provisions for refilling the bowl after the injector had ceased to act, thereby sealing the upper trap, was essential to the successful operation of the flushing apparatus or water-closet, considered as a whole; and that in drafting the several claims of the original patent he intentionally (and with great care, as it would seem) included the flushing-chamber for the reason that it was one of the essential parts of the flushing apparatus, without which the apparatus would not be serviceable.

Boyle's affidavit filed with the Commissioner describes no mistake, inadvertence, or accident. He contents himself with the general statement that a misunderstanding existed between himself and his solicitor, but what the misunderstanding was does not appear. From his testimony on the trial of this case it is made manifest, however, that he as well as Frazer was of the opinion when the original patent was granted that a flushing apparatus constructed according to his design, but without the flushing-chamber to secure an afterwash, would be practically valueless, because it would command no sale. He admits that he made a flushing apparatus such as is last indicated, (that is, an apparatus minus the flushing-chamber;) that it was not satisfactory; that it was not intended to be operative, and (as I understand him) was never intended as a design for a water-closet that he expected to manufacture or sell. The result is that if Boyle and Frazer made any mistake, or labored under any misapprehension when the original patent was taken out, it consisted in the assumption that the omission of the flushing-chamber, on which the afterwash devices depended, and without which there was no means of securing an afterwash automatically, so far as the patentee had then discovered, would leave a practically valueless combination, and hence that there was no need of claiming such a combination. When the statements of Mr. Boyle and his patent solicitor are carefully and fairly analyzed, that

appears to be all that can reasonably be said in support of the contention that the claims of the original patent were due to inadvertence and mistake. But, conceding that the parties named acted on the assumption last stated, it does not appear that even that assumption was erroneous. On the contrary, the testimony shows to my entire satisfaction that Frazer was right in supposing that Boyle's flushing apparatus without the flushing-chamber would be incomplete and, for that reason, practically valueless. Mr. Hanson, who, subsequently to the date of Boyle's invention, secured a patent on a water-closet having a single water-reservoir and an injector, but no flushing-chamber or provision for an afterwash, and who by so doing caused Boyle to apply for a reissue that would invalidate Hanson's patent, is compelled to admit that a water-closet constructed according to the specification of his patent is defective and unsalable, and for that reason has never been put upon the market.

Boyle, Hanson, and Frazer substantially agree that some mechanism to secure an afterwash automatically (that is to say, some mechanism to flush the closet and refill the bowl at the end of the flush by a single pull at the lever) is essential to the successful operation of a flushing apparatus; that without such mechanism an apparatus constructed with double traps, and an injector to exhaust the air between the traps, would be useless in the sense that there would be no demand for such an apparatus. It would seem, indeed, that Boyle displayed quite as much (if not more) ingenuity in devising the mechanism to produce an afterwash, as in employing an injector, which was an old device to pump the air from between the traps. Now, in the case of *Mahn* v. *Harwood* (112 U. S., 359 and 360) it was said that:

> A patent for an invention cannot lawfully be reissued for the mere purpose of enlarging the claim, unless there has been a clear mistake inadvertently committed in wording the claim.

And the same remark is repeated in *Conn* v. *Wilson* (117 U. S., 277.) In *Miller* v. *Brass Co.* (104 U. S., 355) the court said:

> While * * * we do not deny that a claim may be enlarged in a reissued patent, we are of the opinion that this can only be done when an actual mistake has occurred, not from mere error of judgment, * * * but a real *bona fide* mistake inadvertently committed, such as a court of chancery in cases within its ordinary jurisdiction would correct.

So far as I can see the testimony in the case does not tend to establish that either Boyle or Frazer acted so inadvertently or labored under such misapprehension, either of matters of law or fact, when the claims of the original patent were formulated as justified a reissue of the patent under the law as declared in these cases. It was obvious to them, as it is to any one, that the injector would perform its function as well with a single water-tank as with a tank and flushing-chamber combined. They both believed that a water-closet constructed according to Boyle's design, but without provision for an afterwash, would be valueless in the market, and in that they were right. The patentee had discovered no method of producing an afterwash automatically by using a single water-tank, and hence both he and his solicitor regarded the flushing-chamber as one of the essential features of the flushing apparatus intended to be manufactured, and accordingly claimed it industriously in all of the important claims. Conceding that they claimed the "injector" in combination with a part that was non-essential to its operation, and thereby limited the claim, yet they did so in pursuance of a well-defined purpose that was not based upon misconception of matters of fact or ignorance of the law, so far as the records before the Commissioner or the proof in this case shows.

It is an important fact that must be kept in mind in the consideration of this case, that the injector was an old device when Boyle adopted it, and that it could only be claimed in combination with other parts which would together produce a new result or effect or constitute a new machine. (*Reckendorfer* v. *Faber*, 91 U. S., 357.) Boyle placed it in combination with certain other old parts or devices that he deemed necessary to employ to make a new flushing apparatus that would be operative and useful, and by so doing made each element of the combination material, and was undoubtedly entitled to be protected in the use of the combination so formed and claimed. (*Water Metre Co.* v. *Desper*, 101 U. S., 337.) His sole purpose in asking for a reissue, however, appears to have been to slough off one element of the combination, and to so reduce the parts embraced in the claim that it would be impossible for any other person to use an "injector" in the construction of a double-trapped water-closet without paying tribute to his patent. As the claims are stated and enlarged in the reissue, it would be unlawful for a mechanic to use the injector in the construction of a flushing apparatus, even if he should succeed in doing what Boyle failed to accomplish—that is to say, in producing an afterwash automatically by the use of a single tank—because the parts with which the injector has been combined in the claims of the reissue are so few that they must necessarily all be used to work the injector. In other words, the claims in the reissued letters, or some of them at least, are now so broad as to practically cover the injector as a thing susceptible of being separately claimed. If it was new and had not been claimed in the original patent, it might be proper to interpret the law liberally in favor of the inventor to enable him to realize the full benefit of his invention. The fact is, however, that an injector is an old device, and that Boyle merely adopted it and applied it to a new use, and should be limited to that combination in which, as it appears, he deliberately placed it and claimed it. (*Prouty & Mears* v. *Douglass*, 16 Peters, 341. *Eames* v. *Godfrey*, 1 Wall., 79.)

I am forced to the conclusion that the reissued letters, granted under the circumstances and for the purposes hereinafter stated—that is, merely to enlarge the claims—cannot be sustained as a valid grant. (*Burr* v. *Dury*, 22 Wall., 531; *Gill* v. *Wells*, 22 Wall., 1, and cases heretofore cited.) In the first place, although the original patent was inoperative to protect a particular combination not claimed therein to which the inventor now conceives himself to be entitled, yet the failure to claim it was not due to any such inadvertence or mistake as will now entitle him to claim it, the inevitable result being to expand the old claims; and, secondly, the failure to claim such combination originally, even if it was one that ought to have been allowed if claimed, occurred under such circumstances, and was accompanied with such full knowledge of all material facts, as amounted to an abandonment of that particular combination to the public.

The bill is accordingly dismissed.

INDEX TO DECISIONS

DIGEST OF DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS

IN THE MATTER OF

PATENTS, TRADE-MARKS, &c.

OFFICIAL GAZETTE—April-June, 1889.

DIGEST OF DECISIONS.

[Decisions of United States courts designated by an asterisk (*), and of the Attorney-General by a dagger (†).]

AMENDMENTS.

(See Construction of Specifications and Patents, 1; Infringement, 5; Limitations Imposed by the Patent Office.)

ANTICIPATION.

(See Particular Patents, 13, 16, 21, 22.)

APPEALS.

(See Commissioner of Patents; Examiners.)

ASSIGNEES.

(See Validity of Patents.)

ASSIGNMENTS.

(See Assignment by Attorney Under Power of Attorney.)

ASSIGNMENT BY ATTORNEY UNDER POWER OF ATTORNEY.

CONVEYANCE OF PATENT UNDER A POWER OF ATTORNEY.

A conveyance executed by an attorney under a power of attorney to sell for the patentees, for them and in their names, all their right, title, and interest in a patent, is in law their conveyance and not his.

[*H. Tibbe & Son Manufacturing Company v. Heineken, 1221.

ATTORNEYS.

(See Assignment by Attorney Under Power of Attorney.)

BAR TO PATENT.

(See Rehearing, 4.)

BILL OF REVIEW.

(See Decree.)

CAVEATS.

(See Rehearing, 4; Treaty for the Protection of Industrial Property.)

CHANGE OF STRUCTURE.

(See Infringement, 4, 6, 7, 8, 11; Invention, 1, 2.)

CIRCUIT COURTS.

(See Jurisdiction.)

CLAIMS.

(See Reissues, 2.)

COMBINATIONS.

(See Infringement; Invention, 2; Reissues, 4.)

1. CONSTRUCTION OF PATENTS—COMBINATIONS.

In cases where none of the elements of a combination are new or are claimed separately and there are other similar kindred combinations in use the evident tendency of late decisions is to limit the patentee to the particular form of the various elements composing the combination shown by his drawings.

[*Heine Safety Boiler Company v. Smith Feed Water Heater and Purifier Company, 1634.

2. SAME—VALIDITY.

If the claim in Letters Patent No. 304,195, granted August 26, 1884, to Hermann Heine were to receive a broader construction, it is by no means certain that it is valid and ought to be sustained, in view of the state of the art when the patent issued.

[*Id.

COMMISSIONER OF PATENTS.

(See Limitation of United States Patent by Foreign Patent Previously Granted, 1; Practice in the Patent Office, 1, 2; Priority of Invention, 2, 3; Rehearings, 1, 2, 5; Reissues, 3.)

DUTIES OF THE COMMISSIONER DEFINED—WHICH ARE SUBJECT TO REVIEW.

The duties of the Commissioner of Patents are in part administrative and in part of a judicial nature. In the discharge of the latter duties he acts as the direct representative and agent of the law, subject to no appeal excepting to the tribunals expressly designated by statute. The rule limiting the right of an administrative officer to review his predecessor's decision to the three cases specified may be applicable to the Commissioner in his capacity as an administrative officer; but it is clear that it is not binding upon the Commissioner in the discharge of his judicial duties.

[*Daniels v. Morgan, 811.

CONSTRUCTION OF CLAIMS.

(See Infringement, 4, 5, 6, 7, 10; Particular Patents, 11.)

CLAIM CONSTRUED AND RESTRICTED.

The prior state of the art and the express language of the specification in Letters Patent No. 180,857 combine to restrict the second claim to the use of a stencil made by the electric pen.

[*Edison *et al. v.* Klaber, 1486.

CONSTRUCTION OF RULES.

(See Rehearing, 1, 6.)

CONSTRUCTION OF SPECIFICATIONS AND PATENTS.

(See Combination; Construction of Claims; Disclaimers; Infringement; Invention; Invention Described but not Claimed; Limitation Imposed by the Patent Office; Particular Patents; Reissues, 1.)

1. LIMITATION IMPOSED BY PATENT OFFICE.

The intimation in *Sargeant* v. *Hall* (114 U. S., 38) that the limitations introduced into an application after it was persistently rejected must be strictly construed against the inventor and in favor of the public, and looked upon as in the nature of disclaimers, means no more than that when under the state of the art and the action of the Office a patentee of a combination has modified and limited his claim he shall be held strictly to the combination as he has described it. It does not debar the patentee from the benefit of the doctrine of equivalents.

[*Rodebaugh *et al. v.* Jackson *et al.*, 658.

2. SCHILLINGER—CONCRETE PAVEMENTS—REISSUE.

Reissued Letters Patent No. 4,364, granted May 2, 1871, to John J. Schillinger, for an improvement in concrete pavements, as it stood after the filing of the disclaimer, (March 1, 1875,) was not open to the objection that it was not for the same invention as that of the original Patent No. 105,590, dated July 19, 1870.

[*Hurlbut *v.* Schillinger *et al.*, 1067.

DIGEST OF DECISIONS.

[Decisions of United States courts designated by an asterisk (*), and of the Attorney-General by a dagger (†).]

(See Infringement; Invention, 2; Reissues, 4.)

1. CONSTRUCTION OF PATENTS—COMBINATIONS.

In cases where none of the elements of a combination are new or are claimed separately and there are other similar kindred combinations in use the evident tendency of late decisions is to limit the patentee to the particular form of the various elements composing the combination shown by his drawings.

[*Heine Safety Boiler Company *v.* Smith Feed Water Heater and Purifier Company, 1634.

2. SAME—VALIDITY.

If the claim in Letters Patent No. 304,195, granted August 26, 1884, to Hermann Heine were to receive a broader construction, it is by no means certain that it is valid and ought to be sustained, in view of the state of the art when the patent issued.

[*Id.

COMMISSIONER OF PATENTS.

(See Limitation of United States Patent by Foreign Patent Previously Granted, 1; Practice in the Patent Office, 1, 2; Priority of Invention, 2, 3; Rehearings, 1, 2, 5; Reissues, 3.)

DUTIES OF THE COMMISSIONER DEFINED—WHICH ARE SUBJECT TO REVIEW.

The duties of the Commissioner of Patents are in part administrative and in part of a judicial nature. In the discharge of the latter duties he acts as the direct representative and agent of the law, subject to no appeal excepting to the tribunals expressly designated by statute. The rule limiting the right of an administrative officer to review his predecessor's decision to the three cases specified may be applicable to the Commissioner in his capacity as an administrative officer; but it is clear that it is not binding upon the Commissioner in the discharge of his judicial duties.

[*Daniels *v.* Morgan, 811.

CONSTRUCTION OF CLAIMS.

(See Infringement, 4, 5, 6, 7, 10; Particular Patents, 11.)

CLAIM CONSTRUED AND RESTRICTED.

The prior state of the art and the express language of the specification in Letters Patent No. 180,857 combine to restrict the second claim to the use of a stencil made by the electric pen.

[*Edison *et al. v.* Klaber, 1486.

CONSTRUCTION OF RULES.

(See Rehearing, 1, 6.)

CONSTRUCTION OF SPECIFICATIONS AND PATENTS.

(See Combination; Construction of Claims; Disclaimers; Infringement; Invention; Invention Described but not Claimed; Limitation Imposed by the Patent Office; Particular Patents; Reissues, 1.)

1. LIMITATION IMPOSED BY PATENT OFFICE.

The intimation in *Sargeant* v. *Hall* (114 U. S., 38) that the limitations introduced into an application after it was persistently rejected must be strictly construed against the inventor and in favor of the public, and looked upon as in the nature of disclaimers, means no more than that when under the state of the art and the action of the Office a patentee of a combination has modified and limited his claim he shall be held strictly to the combination as he has described it. It does not debar the patentee from the benefit of the doctrine of equivalents.

[*Rodebaugh *et al. v.* Jackson *et al.*, 658.

2. SCHILLINGER—CONCRETE PAVEMENTS—REISSUE.

Reissued Letters Patent No. 4,364, granted May 2, 1871, to John J. Schillinger, for an improvement in concrete pavements, as it stood after the filing of the disclaimer, (March 1, 1875,) was not open to the objection that it was not for the same invention as that of the original Patent No. 105,509, dated July 19, 1870.

[*Huribut *v.* Schillinger *et al.*, 1067.

3. SAME—INVENTION CONSTRUED.
Thus sustained and construed the invention is held to consist in dividing the pavement into blocks, so that one block can be removed and repaired without injury to the rest of the pavement, the division being effected by either a permanent or a temporary interposition of something between the blocks.
[*Id.

4. INFRINGEMENT.
The use of a bottom layer of coarse cement, and placing on it a course of fine cement, and dividing the upper course into blocks by a trowel run partially or wholly through the upper course while it is plastic, in a line coincident with the joints between the sections in the lower layer, accomplishes the substantial results of Schillinger's invention, in substantially the way devised by him, and is within the patent as it stands after the disclaimer. [*Id.

5. DISCLAIMER—INFRINGEMENT.
The patent might be held to be invalid on account of its covering the product, of which the patentee is not the inventor, and which is a material and substantial part of the thing patented, (R. S., 4920;) but regarding this as claimed through inadvertence, accident, or mistake, without any willful default or intent to defraud or mislead the public, the patentee may file a disclaimer to the second claim now, and thereupon have a decree for the infringement of the first claim, without costs.
[*Hake *v.* Brown *et al.*, 1071.

6. DESCRIPTION.
The description in the specification of the patent, which, it should be remembered, is addressed to persons skilled in the particular art to which the invention relates, is sufficiently explicit to enable a person skilled in the art to practice the invention.
[*Am Ende *v.* Seabury & Johnson, 1354.

CONSTRUCTION OF STATUTES.

(See Copyrights; Suits in Equity for a Patent under Section 4915 Revised Statutes, 1; Limitation of United States Patent by Foreign Patent Previously Granted, 1, 3.)

COPYRIGHTS.

(See Jurisdiction.)

1. COPYRIGHT—SECTION 4963 CONSTRUED—PENALTY.
The language of section 4963 Revised Statutes, providing a penalty for falsely marking articles "Copyrighted," is not "for each copy," and while it may be true that if upon different days, under different circumstances, separate copies are printed, each transaction thus separate would constitute a separate offense, yet when the printing of many copies is a single continuous act only one offense is committed thereby.
[*Taft *v.* The Stephens Lithographing and Engraving Company, 1355.

2. SAME—SAME—ARTICLES NOT COPYRIGHTABLE.
The law is clear that no offense is committed when the word "Copyrighted" is placed upon an article that is not the subject-matter of copyright—that cannot be copyrighted.
[*Id.

3. DEMURRER.
It being alleged in the petition that the print is not the subject of copyright, the demurrer sustained. [*Id.

DAMAGES AND PROFITS.

(Licenses; Measure of Damages; Use of Patented Articles.)

1. MEASURE OF DAMAGES.
It is a general rule in patent causes that established license-fees are the best measure of damages that can be used. In this case the master excluded certain license-fees as the basis of computing damages on the ground that they were practically settlements of pending litigations between the complainants and the parties taking said licenses, made with one exception after the commencement and during the pendency of this suit. *Held* that those licenses were in full operation when the defendants elected to resume their infringing manufacture; that they are competent evidence as bearing upon the fair market value of the privilege which the infringers have wrongfully undertaken to exercise, and that the defendants took the risk of being compelled to pay damages on the basis of the rate of license thus established.
[*Cary *et al. v.* The Lovell Manufacturing Company, (Limited,) 525.

2. INFRINGEMENT—ESTIMATING DAMAGES.
The basis for estimating damages for infringement should be the amount of profit or savings made by the use of the infringing device over what could have been made by the use of devices free and open to the public.
[*McMurray *et al. v.* Emerson, 815.

DECREE.

PRACTICE IN THE COURTS.
The facts are set forth in the statement. The Court held that the whole basis and foundation of the present suit had disappeared by reason of its decree in a former case, and that the cause should be remanded to the circuit court with instructions to allow the appellant, defendant below, to file such supplemental bill as he may be advised, in the nature of a bill of review, or for the purpose of suspending or avoiding the decree, upon the new matter arising from the reversal of the decree in the former case.
[*Ballard *v.* Searles, 655.

DEFECTIVE SPECIFICATION.

(See Particular Patents, 25.)

DEFENSE.

(See Suits for Infringement.)

DEMURRER.

(See Copyrights, 3.)

DESCRIPTION.

(See Construction of Specifications and Patents, 6; Particular Patents, 3; Rehearing, 4.)

DESIGN PATENTS.

1. LETTERS PATENT AS PRIMA FACIE EVIDENCE.
The rule is well settled that the production of Letters Patent for a Design establishes a *prima facie* right in the patentee which can only be defeated by proofs which are of convincing force.
[*Untermeyer *v.* Freund *et al.*, 527.

2. DESIGN PATENTS AS DISTINGUISHED FROM PATENTS FOR INVENTIONS.
The validity of a patent for a Design does not depend upon the exercise of the "inventive faculty of the mind" in the sense in which that expression is used in connection with inventions which relate strictly to the useful arts. [*Id.

3. DESIGNS ANALOGOUS TO COPYRIGHTS.
The policy which protects a Design is akin to that which protects the works of an artist by copyright. If the Design produce a different impression upon the eye, even though it be simple, and does not show wide departure from other designs, its use will be protected. [*Id.

DILIGENCE.

(See Priority of Invention, 1.)

DISCLAIMERS.

(See Construction of Specifications and Patents, 1, 2, 3, 5; Infringement, 6, 7; Particular Patents, 23.)

DISCLAIMER NO REMEDY.
To disclaim the skein except for use in the process of dyeing would not change the patent into one for the process. The patent for the skein would still be void and the process of using it be still free from the patent.
[*Grant *v.* Walter, 1220.

DIVISION OF APPLICATION.

1. DIVISION—PROCESS AND PRODUCT—RE-EXAMINATION OF EX PARTE BLYTHE, (C. D., 1885, p. 82.)
While there is no express provision of the statute limiting or controlling the discretion of the Commissioner in embracing more than one invention in the same Letters Patent, and the courts would not for that reason declare such a patent void, the statute does prohibit the introduction into reissue patents of new matter or other invention than that covered by the original patent. The Supreme Court has held that under this prohibition no new matter could be introduced; that process and apparatus are separate and distinct inventions, and that when a patent for one has issued, although the other was distinctly shown, a reissue for both could not be maintained. (*Burt* v. *Duryee*, 1 Wall., 531; *James* v. *Campbell*, 104 U. S., 356; *Powder Co.* v. *Powder Works*, 98 U. S., 126; *Heald* v. *Rice*, 104 U. S., 737.)
[*Ex parte* Tainter, 135.

2. SAME.
The opposite conclusion has been reached in regard to process and product when both were new and the process could produce no other product and the product could be made by no other process. This conclusion is based upon the premise that such process and product contribute one single invention. It must be deemed settled by the highest authority that such processes and products are not separate and distinct but unitary inventions, and that the process and product may be regarded and claimed as parts of such invention, much as different elements in a combination may be separately claimed. This conclusion finds satisfactory support in the nature of the invention itself, as well as in the character of legal property residing in it.
[Id.

3. SAME.
This conclusion excludes all other cases of process and product, such as when either process or product is not new, or when the product can be made by some other process or the process will produce some other product. [Id.

4. SAME.
The novelty of the tablet in the present case doubted, but not determined; but the novelty and patentability of the process denied. The question of division in such case, being a preliminary one, must be settled first, and consequently the action of the examiner in requiring division is affirmed for this reason, and not upon the general proposition. [Id.

1. EQUIVALENTS.
The mechanical devices used by the defendant are known substitutes or equivalents for those employed in the Morley machine to effect the same results, and this is the proper meaning of the term "known equivalents," in reference to a pioneer machine, such as that of Morley.
[*Morley Sewing Machine Company *et al. v.* Lancaster, 267.

2. IMPROVEMENT ON PIONEER MACHINES.
Where an invention is one of a primary character and the mechanical functions performed by the machines are as a whole entirely new all subsequent machines which employ substantially the same means to accomplish the same results are infringements, although the subsequent machines may contain improvements in the separate mechanisms which go to make up the machine. [*Id.

3. MECHANICAL EQUIVALENT.
In such a case, where an infringer has attempted to avoid the patent by the use of a well-recognized mechanical equivalent, the court is bound to look to the state of the art at the time the patent was applied for to determine the limitations of the claim.
[*Rodebaugh *et al. v.* Jackson *et al.*, 658.

4. SAME—NON-INFRINGEMENT.
Where the claim is limited to a lever locking in vertical position, and defendants' lever, like a prior patented lever, locked in a horizontal position, *Held* that the claim is either anticipated or not infringed. [*Id.

5. NON-INFRINGEMENT.
Where after official rejection a patentee's claim was limited to the specific device described, in which the lever for operating the dog-bar locked when in vertical position, and the defendant's lever was so arranged as not to lock in that position, *Held* to be no infringement.
[*Rodebaugh *et al. v.* Jackson *et al.*, 660.

6. SCHILLINGER—REISSUE 4,364—FIRST CLAIM.
The first claim of the reissue, as it stands after the disclaimer, is infringed, because the defendant's pavement is a concrete pavement, laid in detached blocks or sections, substantially in the manner shown and described in the specification of the reissue, the detached blocks in the upper course being the equivalent of the detached blocks or sections of the Schillinger pavement.
[*Huribut *v.* Schillinger *et al.*, 1067.

7. SAME—SECOND CLAIM.
The second claim of the reissue is infringed, because the temporary use of the trowel or cutting-instrument, to divide the upper course into blocks, is the equivalent of the tar-paper of the Schillinger patent, the cutting making a division which controls the cracking, and facilitates the taking up and relaying of the blocks or sections in the upper course "without disturbing the adjoining sections," and the trowel being interposed to effect its object during the process of forming the pavement on the spot where it is to remain. [*Id.

8. INFRINGEMENT—RIGHT TO USE AND IMPROVE A PATENTED MACHINE.
A machine purchased of the complainant, the patentee, by the employer of the defendant was repaired and its construction somewhat changed by the defendant in his capacity as an employé of the purchaser. *Held* that the purchaser was at liberty to repair and improve it within the limits of his contract, and that so long as the identity of the machine was not destroyed its owner had the right to discard useless parts and add new ones which might improve its action.
[*Young *et al. v.* Foerster, 1353.

9. SAME—PARTIAL USE.
One who has a license to use the whole of a machine does not become an infringer by the use of a part only. [*Id.

10. EDISON—PATENT NO. 180,857 NOT INFRINGED.
As claim 2 is construed it is not infringed by the defendant's device. The "cyclostyle" of the defendant shows another step in the art. It is as much an improvement on Edison's method as that was an improvement on what preceded it.
[*Edison *et al. v.* Klaber, 1486.

11. COMBINATIONS.
Applying the rule that where none of the elements of a combination are new or are claimed separately and there are other similar kindred combinations in use, the patentee is limited to the particular form of the various elements composing the combination shown by his drawings to Letters Patent No. 304,195, granted August 26, 1884, to Hermann Heine, for purifiers for the feed-water of steam-boilers, the patent is not infringed by a device differing essentially therefrom in construction.
[*Heine Safety Boiler Co. *v.* Smith Feed Water Heater and Purifier Co., 1634.

INJUNCTION.

(See Trade-Marks.)

INJUNCTION.
Motion for injunction to enjoin defendants from manufacturing wash-boards which infringe the patent to Gorham (No. 223,838, dated January 8, 1880) granted. (Sargent *et al. v.* Burgess, 46 O. G., 693, referred to.)
[*Sargent *et al.* v. Jenkins *et al.*, 404.

INVENTION.

See Construction of Specifications of Patents, 1, 2, 3, 4; Disclaimers; Particular Patents, 2, 6, 18, 19, 20, 24.)

1. ANTICIPATION—EQUIVALENT.
When a T-lever had already been used for operating a sawmill dog, there was no invention in the substitution of an eccentric-lever which was used to perform the same function in a no more effectual manner.
[*Rodebaugh *et al. v.* Jackson *et al.*, 658.

2. SAME—REARRANGEMENT.
The rearrangement of an old combination, where each element of the combination operates practically as before, is not patentable unless a new or greatly-improved result is gained.
[*Id.

3. MECHANICAL SKILL.
There was no invention in providing a bearing-surface (covered by claim 4) upon the frame of a dash, to which the foot of a brace was to be attached to support the brace and dash, either by an increase in the quantity of metal or otherwise, so as to strengthen the proper part, in a proper way, for its proper duty.
[*Peters *v.* Hanson *et al.*, 945.

4. INVENTION—MECHANICAL SKILL.
Where it appears that plackets in drawers have been bound in substantially the same manner as the applicant's alleged invention, it is not invention to extend that idea and make the binding include the opening for the wrist or neck or body in a shirt or other garment, or to slightly or obviously modify the manner in which the binding is turned, or to omit a cord from the binding which is simply a strengthener, or to merely prolong the binding itself.
[*Ex parte* West, 1731.

5. SAME—FORMER DECISIONS FOLLOWED.
The cases of *Smith* v. *Nichols* (21 Wall., 112) and *Hollister* v. *Benedict Manufacturing Co.* (113 U. S., 59) followed in this respect.
[Id.

INVENTION DESCRIBED BUT NOT CLAIMED.

(See Disclaimer.)

INVENTION DESCRIBED BUT NOT CLAIMED.
While the specification makes many references to the use of the skein in the process of dyeing, which process of using might be patentable, it is not covered by the claims, and they rigidly control.
[*Grant *v.* Walter, 1220.

JURISDICTION.

(See Practice in the Patent Office, 1; Rehearing, 1.)

JURISDICTION.
The circuit courts have jurisdiction of suits brought to recover penalties imposed by the copyright laws of the United States.
[*Taft *v.* Stephens Lithographing and Engraving Company, 142.

JURISDICTION OF THE SECRETARY OF THE INTERIOR OVER THE COMMISSIONER OF PATENTS.

(See Commissioner of Patents.)

LABELS.

(See Use of Patented Articles.)

LETTERS PATENTS AND PRIMA FACIE EVIDENCE.

(See Design Patents, 1.)

LICENSEES.

LICENSE—INFRINGEMENT.
The defendant is a licensee of the Detroit Lubricating Company under a license which is limited upon its face to patents owned by that company. The Detroit Lubricating Company is the licensee of the complainant under a contract which does not grant an exclusive license for the manufacture or use of the Gates patent owned by the complainant, and which is infringed; *Held* that the defendant was not protected by its license in the manufacture of articles under the Gates patent.
[*The Seibert Cylinder Oil Cup Company *v.* The William Powell Company, 1072.

LICENSE.

(See Infringement, 9; Suits for Infringement.)

LICENSE FEES.

(See Damages and Profits, 1.)

LIMITATION IMPOSED BY THE PATENT OFFICE.

(See Construction of Specifications and Patents, 1; Infringement, 5.)

LIMITATION IMPOSED BY PATENT OFFICE.
Where a claim in complainants' application broad enough to cover the machine used by defendants was rejected on reference to a prior patent, and the applicant was compelled to present a new claim having a limitation not found in the claim first presented, the new claim cannot be enlarged to cover what was first rejected.
[*Rodebaugh *et al. v.* Jackson *et al.*, 660.

LIMITATION OF UNITED STATES PATENT BY FOREIGN PATENT PREVIOUSLY GRANTED.

1. LIMIT OF POWER OF COMMISSIONER OF PATENTS UNDER SECTION 4887 REVISED STATUTES OF THE UNITED STATES TO ISSUE LETTERS PATENT FOR AN INVENTION PREVIOUSLY PATENTED IN A FOREIGN COUNTRY.
Section 4887 of the Revised Statutes of the United States so limits the power of the Commissioner of Patents that where an invention has been patented in a foreign country he cannot lawfully issue an American patent for the same invention for a term to extend beyond the actual duration of the life of the foreign patent.
[*Huber *et al. v.* N. O. Nelson Manufacturing Company, 1732.

2. SAME—AN AMERICAN PATENT CANNOT BE LAWFULLY ISSUED AFTER THE LAPSE OF A FOREIGN PATENT FOR THE SAME INVENTION.
Letters Patent of the United States granted after a foreign patent for the same invention had lapsed and become null and void by reason of the non-payment of a stamp duty, *Held*, granted without authority of law and void.
[*Id.

3. LIMITATION OF A UNITED STATES PATENT UNDER SECTION 4887.
The termination of a foreign patent prior to the time specified on the face of the grant by the failure of the patentee to comply with some requirement of the foreign law has the effect of terminating a subsequently-issued American patent for the same invention.
[*Id.

MACHINE AND PRODUCT.

(See Use of Patented Articles.)

MEASURE OF DAMAGES.

(See Damages and Profits.)

1. MEASURE OF DAMAGES.
The rule that "when the entire profit of a business or undertaking results from the use of the invention, the patentee will be entitled to recover the entire profits, if he elects that remedy," applied.
[*Huribut *v.* Schillinger *et al.* 1067.

2. SAME.
The payment of a sum in settlement of a claim for an alleged infringement of a patent cannot be taken as a standard to measure the value of the improvements patented in determining the damages sustained by the owner of the patent in other cases of infringement.
[*Cornely *v.* Marckwald, 1353.

(See Use of Patented Inventions.)

OLD DEVICE.

(See Invention, 2; Particular Patents, 7, 18, 19.)

PARTIAL USE.

(See Infringement, 9.)

PARTICULAR PATENTS.

1. AM ENDE—COMPOSITION OF BORATED COTTON.
Letters Patent No. 181,024, granted August 15, 1876, to Charles G. Am Ende, for an improvement in borated cotton, *Held* valid and not anticipated by such preparations as "lint steeped in a hot saturated solution of boracic acid" or "wadding saturated with a certain quantity of glycerine" or boracic acid dissolved in glycerine.
[*Am Ende *v.* Seabury & Johnson, 1354.

2. BALLARD AND WADDELL—STREET-PAVEMENTS.
Letters Patent No. 94,062, granted August 24, 1869, to Ballard and Waddell, for an improvement in street-pavements, and Letters Patent No. 94,063, granted same date to the same parties, for an improved mode of cutting blocks for street-pavement, *Held* void for want of patentable novelty.
[*Brown *v.* The District of Columbia, 398.

3. BÉNÉ—PROCESS OF REFINING AND BLEACHING HAIR.
Reissued Letters Patent No. 8,637, granted March 25, 1879, to John Béné, for an improvement in the process of refining and bleaching hair, *Held*, except as to the second claim, not full and clear enough to give one skilled in chemistry such an idea of the particular kinds and character of the chemicals or combination of chemicals, with the relative proportions of each, as would enable him to use the invention without having to resort to experiments of his own to discover the ingredients.
[*Béné *et al. v.* Jeantet, 402.

4. SAME—CONSTRUCTION AND LIMITATION OF PATENT.
The patent limited to the second claim is to be construed as one for a process of refining hair by treating it in a bath composed of a solution of chlorine salt dissolved in an excess of muriatic acid, and the claims are to be limited accordingly.
[*Id.

5. SAME—INFRINGEMENT.
Thus limited and construed the patent is not infringed, and the allegation that the product cannot be produced except by treating the hair in a bath composed of chlorine salt dissolved in an excess of muriatic acid, or a solution of their (chemical) equivalents, is not established.
[*Id.

6. COWING—STREET PAVEMENTS.
Letters Patent No. 101,590, granted to Turner Cowing April 5, 1870, for a new mode of constructing wood pavement for streets, cannot be regarded as possessing patentable novelty.
[*Brown *v.* The District of Columbia, 396.

7. EDISON—AUTOGRAPHIC PRINTING.
Letters Patent No. 180,857, for an improvement in autographic printing, granted to Thomas A. Edison August 8, 1876, cannot be regarded as a pioneer patent in this art. There could be no broad claim for printing with a paper stencil, semi-liquid ink, and a roller. Neither could there be a broad claim for a puncturing device. Both were old.
[*Edison *et al. v.* Klaber, 1486.

8. GRANT—REELING AND WINDING SILK AND THREAD.
The claims of Letters Patent No. 267,192, granted November 7, 1882, to James M. Grant, for improvements in the art of reeling and winding silk and other thread, are for the skein merely as a product, and are void for want of novelty.
[*Grant *v.* Walter, 1220.

9. HAKE—VISITING-CARDS.
Letters Patent No. 219,464, granted September 9, 1879, to Philip Hake, for an improvement in visiting-cards, *Held* valid as to the first claim, which covers the process of arranging cards in oblique packs and beveling and ornamenting and finishing the sides and ends of the whole pack as though it were one card, but invalid as to the second claim, covering the product, which is old in the sense of the patent law.
[*Hake *v.* Brown *et al.*, 1071.

10. HEINE—PURIFIERS FOR FEED-WATER FOR STEAM-BOILERS.
Applying the rule that when none of the elements of a combination are new or are claimed separately, and there are other similar kindred combinations in use, the patentee is limited to the particular form of the various elements composing the combination shown by his drawings to Letters Patent No. 304,195, granted August 26, 1884, to Hermann Heine, for purifiers for the feed-water of steam-boilers, the patent is not infringed by a device differing essentially therefrom in construction.
[*Heine Safety Boiler Company *v.* Smith Feed Water Heater and Purifier Company, 1644.

11. SAME—VALIDITY.
If the claim were to receive a broader construction, it is by no means certain that it is valid and ought to be sustained, in view of the state of the art when the patent issued.
[*Id.

12. JOHNSON—CUTTING-PLIERS.
The conclusion of the circuit court (38 O. G., 1140) that Moses C. Johnson was not the first and original inventor of the improvements claimed in Letters Patent No. 232,975, granted October 5, 1880, to Henry G. Thompson, as assignee of said Moses C. Johnson, for cutting-pliers, sustained and decree affirmed.
[*Thompson *v.* Hall *et al.*, 636.

13. JORDAN AND SMITH—WRENCHES.
Reissued Letters Patent No. 5,291, to Lucius Jordan and Leander E. Smith February 25, 1873, for an improvement in wrenches, *Held* to be anticipated by the patent to Loring Coes April 16, 1841, and by the wrenches known as the "Hewitt" wrenches, manufactured in 1851-4, and to be void for want of patentable novelty.
[*Collins Company *v.* Coes *et al.*, 623.

14. MORLEY—MACHINES FOR SEWING BUTTONS ON FABRICS, &c.
Letters Patent No. 236,350, granted January 4, 1881, to Joseph H. Morley, for a machine for sewing buttons on fabrics, &c., is entitled to receive a liberal construction in view of the fact that the inventor was a pioneer in the construction of an automatic button-sewing machine, and is not to be limited to the particular devices or instrumentalities described by him, used in the three main elements of his machine, which combine together to make it up.
[*Morley Sewing Machine Company *et al. v.* Lancaster, 267.

15. SAME—INFRINGEMENT.
As thus construed the patent is infringed by defendant's machine manufactured under Letters Patent No. 268,309, granted November 28, 1882, to Joseph Mathison, for a machine for sewing on buttons, the means employed in which are substantially equivalents of those used in the Morley machine.
[*Id.

16. PETERS—TOOLS FOR ATTACHING SHEET-METAL MOLDINGS.
Claims 1 and 2 of Letters Patent No. 178,463, granted June 6, 1876, to George M. Peters, for an improvement in tools for attaching sheet-metal moldings, *Held* to be anticipated by a machine used by Joseph P. Noyes, Binghamton, N. Y., as early as September, 1867.
[*Peters *v.* The Active Manufacturing Company, 948.

17. SAME—SAME—INFRINGEMENT.
Claim 3 not infringed by defendant's apparatus, in which no washers are used for adjustment. [*Id.

18. PETERS—VEHICLE-DASHES.
Claims 1, 2, and 3 of Letters Patent No. 213,539, granted March 25, 1879, to George M. Peters, for an improvement in vehicle-dashes, cover merely applications of old devices to new uses, not involving invention.
[*Peters v. Hanson *et al.*, 945.

19. SAME—VEHICLE-DASH FRAMES.
Reissue Letters Patent No. 9,891, granted October 11, 1881, to George M. Peters, for an improvement in vehicle-dash frames, does not involve invention. The process was old in the state of the art of working metals. [*Id.

20. PETERS—DIE FOR MAKING DASH-FRAMES.
Letters Patent No. 281,553, granted July 17, 1883, to George M. Peters, for an improvement in dies for making dash-frames for carriages, *Held* void for want of invention.
[*Peters v. The Active Manufacturing Company, 1219.

21. RODEBAUGH—SAW-MILL DOG—INVALID PATENT.
The first claim of Letters Patent No. 196,102, granted October 16, 1877, to George W. Rodebaugh, for an improvement in saw-mill dogs, is anticipated by the patent of Craney, No. 150,534, dated May 5, 1874.
[*Rodebaugh *et al.* v. Jackson *et al.*, 660.

22. RODEBAUGH—SAW-MILL DOG—INVALID PATENT.
The first claim of Letters Patent No. 196,102, granted October 16, 1877, to George W. Rodebaugh, for an improvement in saw-mill dogs, is anticipated both by the patent of Craney, No. 150,534, dated May 5, 1874, and the patent of Ely, No. 163,300, dated May 18, 1875.
[*Rodebaugh *et al.* v. Jackson *et al.*, 658.

23. SCHILLINGER—CONCRETE PAVEMENTS—REISSUE.
Reissued Letters Patent No. 4,364, granted May 2, 1871, to John J. Schillinger, for an improvement in concrete pavements, as it stood after the filing of the disclaimer, (March 1, 1875,) was not open to the objection that it was not for the same invention as that of the original Patent No. 105,599, dated July 19, 1870.
[*Hurlbut v. Schillinger *et al.*, 1067.

24. TIBBE—PIPES.
Letters Patent No. 205,816, granted July 9, 1878, to Henry Tibbe, for an improvement in pipes, *Held*, in view of the state of the art, void for want of patentable novelty.
[*H. Tibbe & Son Manufacturing Company *v.* Heineken, 1221.

25. WOOD—CARRIAGE-SPRINGS—REISSUE VOID.
Reissued Letters Patent No. 6,018, granted to Thomas H. Wood August 18, 1874, for an improvement in carriage-springs, *Held* void, not only because it is for an invention not disclosed or suggested in the original, but also because, as in the case of *Coon et al.* v. *Wilson*, (30 O. G., 889; 113 U. S., 268,) there was no defective or insufficient specification, and no mistake inadvertently committed in the wording of the claim of the original.
[*J. B. Brewster & Co. *v.* Shuler, 1485.

26. SAME—PRIOR PUBLIC USE.
The defense of prior public use also established. [*Id.

PRACTICE IN THE PATENT OFFICE.

(See Division of Application; Examiners; Priority of Invention; Reduction to Practice; Rehearing, 1, 3, 5, 6, 7.)

1. RIGHT OF THE COMMISSIONER OF PATENTS TO REHEAR THE DECISIONS OF HIS PREDECESSOR IN OFFICE—HISTORY AND REVISIONS OF RULE 144 OF THE RULES OF PRACTICE DISCUSSED AND DECISIONS THEREUNDER REVIEWED.
Rule 144 had its origin in an executive order, was transformed into a judicial rule when the Commissioner of Patents was, by act of July 1, 1870, substituted for the Supreme Court of the District of Columbia as the tribunal having final jurisdiction, and at a later date the office of Commissioner was recognized as a continuing one, placed upon the same footing as a court, and given the power of granting new trials.
[*Daniels *v.* Morgan, 811.

2. IN DISCHARGE OF OFFICIAL DUTIES, REASONABLE RULES AND REGULATIONS ARE VALID.
Since the Commissioner of Patents in the discharge of his judicial duties in determining the question of priority between interfering parties exercises the function of a court, reasonable rules and regulations, based upon analogies derived from the procedure in courts of law, are valid rules and regulations when prescribed by the competent authority. [*Id.

PRIMA FACIE EVIDENCE.

(See Design Patents, 1.)

PRIORITY OF INVENTION.

(See Rehearing, 7.)

1. WORKING MODEL NOT REDUCTION TO PRACTICE.
In the decision complained of (46 O. G., 1515) it was held that a working model designed and intended as such is not a reduction to practice, *held* no error. A model or drawing, although a sufficient foundation for a claim to priority, as was held in *Loom Co.* v. *Higgins*, must be followed up with reasonable diligence in order to establish full title to priority.
[Green *v.* Hall *v.* Siemens *v.* Field, 1631.

2. INTENT OF INVENTOR.
Where it was alleged as error that the Commissioner erroneously decided that one of the parties did not intend at the time he constructed the apparatus upon which his claim to priority was based to use it practically upon an electric railway, and it appeared that the Commissioner did not decide what was the ultimate intention of such party with reference to his invention, but simply decided that certain models were designed and intended as models, *held* no error. [Id.

3. SAME.
Where it was alleged as error that the Commissioner held that priority of invention was to be determined by the intent of the inventor as to the use to which his apparatus should be put, and it appeared that the actual finding of the Commissioner upon that subject was limited to the intent with which certain models were made and used, *held* no error. [Id.

PROCESS.

(See Disclaimers; Use of Patented Inventions.)

PROCESS AND PRODUCT.

(See Construction of Specifications and Patents, 5; Division of Application, 1, 2, 3, 4.)

PRODUCTS.

(See Use of Patented Articles.)

PUBLIC USE.

(See Particular Patents, 25, 26.)

REDUCTION TO PRACTICE.

(See Priority of Invention, 1.)

PUTTING IN INTERFERENCE DOES NOT DETERMINE THE QUESTION OF REDUCTION TO PRACTICE.
The allegation that the fact of an application being put in interference determines that the invention has been reduced to practice, overruled. The Office possesses no machinery for ascertaining such fact, but assumes for the purposes of the interference that the invention of each applicant is within the issue, although the subsequent history of the rival inventions may develop the fact that while one of them is in a form capable of commercial use the other may be incapable of any practical use whatever.
[Green *v.* Hall *v.* Siemens *v.* Field, 1631.

REHEARING.

(See Commissioner of Patents; Practice in the Patent Office, 2; Priority of Invention; Reduction to Practice.)

1. JURISDICTION OF THE COMMISSIONER TO REHEAR.
Rule 144, based upon the procedure in courts of law, does in terms confer, and was intended to confer, upon the Commissioner jurisdiction to rehear the decisions of his predecessor when grounds other than those based on fraud, error in computation, or newly-discovered evidence are alleged and set forth in motions filed for the rehearing of such decisions.
[*Daniels *v.* Morgan, 811.

2. IN INTERFERENCE PROCEEDINGS A REHEARING OTHERWISE ALLOWABLE SHOULD NOT BE BARRED BECAUSE OF A CHANGE IN COMMISSIONER.
It certainly would be a hardship if in an interference proceeding, when the Commissioner who rendered the decision would on sufficient showing have been swift to afford a rehearing, the defeated applicant should be without remedy because of the succession to office of a new Commissioner, and a rule adapted to prevent such a result certainly commends itself as a part of a system of procedure designed to do justice between parties who are asking the Patent Office to determine which of them is the prior inventor of an invention which can be patented to but one of them. [*Id.

3. PRACTICE IN THE PATENT OFFICE—MOTIONS FOR REHEARINGS.
The practice of splitting up cases and allowing separate parties to file separate motions and present them at different times condemned. In interference proceedings motions for rehearings presented by the parties thereto ought to be heard at the same time, in order that the entire case may be disposed of at once.
[Green *v.* Hall *v.* Siemens *v.* Field, 813.

4. MOTION FOR REHEARING OVERRULED—SIEMENS.
Siemens's motion for rehearing overruled, and *Held*, *first*, that while the law does not require that a caveat shall give a complete and accurate description of the construction and details of an invention, the caveat filed by Field is a full and complete disclosure of the subject-matter in controversy. *Second*, that knowledge of foreign invention, although of an earlier date than an original invention in this country, is not necessarily a bar to a domestic patent. [Id.

5. SAME—GREEN.
Green's motion for rehearing overruled because (*first*) it involves a question of merits which is *res adjudicata* by reason of the previous decision of the Commissioner and also that of his predecessor, and (*second*) because it shows no error in the former decision which Green seeks to have set aside.
[Id.

6. GROUND FOR REHEARING.
Manifest error in law, being ground for new trial, is also ground for a rehearing under Rule 144.
[Green *v.* Hall *v.* Siemens *v.* Field, 1631.

7. STATUS OF PARTIES AT CONCLUSION OF INTERFERENCE IN RELATION TO PRIOR ART.
After a final award of priority there is no more reason for permitting the defeated party to the interference to be heard upon the relation of the prevailing party to the prior art than there would have been for permitting the same privilege before the institution of the interference.
[Green *v.* Hall *v.* Siemens *v.* Field, 1633.

REISSUES.

(See Division of Application, 1; Infringement, 6, 7; Particular Patents, 3, 23, 25.)

1. WOOD—CARRIAGE-SPRINGS—REISSUE VOID.
Reissued Letters Patent No. 6,018, granted to Thomas H. Wood August 18, 1874, for an improvement in carriage-springs, *Held* void, not only because it is for an invention not disclosed or suggested in the original, but also because, as in the case of *Coon et al.* v. *Wilson*, (30 O. G., 889; 113 U. S., 268,) there was no defective or insufficient specification, and no mistake inadvertently committed in the wording of the claim of the original.
[*J. B. Brewster & Co. *v.* Shuler, 1485.

2. REISSUED LETTERS PATENT—INADVERTENCE, ACCIDENT, AND MISTAKE—SECTION 4916 REVISED STATUTES OF THE UNITED STATES.
A patent for an invention cannot be reissued for the mere purpose of enlarging the claim, unless there has been a clear mistake inadvertently committed in wording the claim. [*Id.

3. SAME—DECISION OF COMMISSIONER OF PATENTS NOT FINAL.
A finding of the Commissioner of Patents as to an original patent being inoperative by reason of inadvertence, accident, or mistake may be reviewed in a suit for infringement, at least to the extent of determining whether as a matter of law what was described and alleged to be a mistake was such a mistake as will warrant a reissue. [*Id.

4. SAME.
Where an applicant, desiring to secure a patent on a combination of old mechanical devices, included a certain element in each claim because he thought it necessary to the usefulness of the machine as a whole, and after the grant of his patent another patent for a similar machine was granted with claims which he thought broader than his own, and in order to invalidate said second patent the first patentee applied for and obtained a reissue with claims so broad that they substantially claimed as a separate device one of the original elements which was old, *Held* that there had been no such inadvertence, accident, or mistake as to warrant a reissue and that said broadened claims were void. [*Id.

REJECTED CASES.

SUBSTITUTION OF DEVICE.

(See Invention, 1.)

SUIT IN EQUITY FOR A PATENT UNDER SECTION 4915 REVISED STATUTES.

1. PRACTICE—CROSS-BILL—SECTION 4915 REVISED STATUTES.
Leave to file cross-bill in proceeding under section 4915 Revised Statutes denied, the object of the cross-bill being to enjoin the complainant from infringing a patent for the same invention already issued to defendant.
[*McCormick Harvesting Machine Company *v.* Deering, 1222.

2. SAME.
The original bill not necessarily involving the question of infringement of the defendant's patent, such a cross-bill is not germane thereto. [*Id.

SUITS FOR INFRINGEMENT.

(See Assignment by Attorney Under Power of Attorney; Jurisdiction; Suit in Equity to Obtain a Patent Under Section 4915 Revised Statutes, 1.)

DEFENSE—ESTOPPEL.

A former licensee is not estopped from questioning the validity of a patent after his license has expired in vindication of acts done subsequent to its termination.

TRADE-MARKS.

INJUNCTION.

Injunction under Trade-Mark No. 16,473, registered April 9, 1889, by Moses Lyman, for a game, "Pigs in Clover."

[*Lyman *v.* Burns, 660.

TREATY FOR THE PROTECTION OF INDUSTRIAL PROPERTY.

LEGISLATION FOR THE ENFORCEMENT OF THE TREATY NECESSARY.

This treaty is a reciprocal one. Each party to it covenants to grant in the future to the subjects and citizens of the other parties certain special rights in consideration of the granting of like special rights to its subjects and citizens. It is a contract operative in the future infraterritorially. It is therefore not self-executing, but requires legislation to render it effective for the modification of existing laws.

[†Opinion of the Attorney General of the United States, 397.

USE OF PATENTED ARTICLES.

INJUNCTION—RIGHTS OF PURCHASER OF PATENTED MACHINE.

The purchaser of a patented machine has the right to use the machine until worn out in the manufacture of the product it is designed to make, and sell the same in the market, and to designate it by label or otherwise as the product of the invention.

[*Martha Washington Creamery Buttered Flour Company of the United States (Limited) *v.* Martien, 1[illegible].

USE OF PATENTED INVENTIONS.

(See Infringement, 8.)

USE OF PATENTED PROCESSES BY A SUBSEQUENT INVENTOR.

A person who subsequently discovers a new mode of carrying out a patented process is not entitled to use the process without the consent of the patentee.

[*Morley Sewing Machine Company *et al.* *v.* Lancaster, 267.

VALIDITY OF PATENTS.

(See Combinations, 2; Construction of Specifications and Patents, 5.)

NULLIFICATION OF PATENTS—PATENTEE—ASSIGNEE.

A patentee may not, as against the assignees of his entire interest, so restrict and qualify the claims of his patent as to make them void for want of novelty.

[*Adee *et al.* *v.* Thomas, 528.

VALID PATENTS.

(See Construction of Specifications and Patents, 2, 3, 4; Particular Patents, 1, 9, 14, 23.)

VOID CLAIMS.

(See Particular Patents, 9; Reissues, 4.)

VOID PATENTS.

Anderson, Henry C., assignor to C. C. Clemens and J. B. Choice, Whitesborough, Tex. Churn-motor	405,336	June 18	1421	274	47	1520
Anderson, James C., Highland Park, Ill. Bricks, &c., incrusted with metal	401,097	Apr. 9	1005	.....	47	199
Anderson, James C., Highland Park, Ill. Incrusting brick	401,098	Apr. 9	1006	.....	47	199
Anderson, James C., Highland Park, Ill. Burning brick	405,666	June 11	1016	271	47	1434
Anderson, Jesse N., Conway, Mo. Saddle-bag	405,649	June 18	1929	507	47	1620
Anderson, John W., Lancaster, Pa. Wash-boiler tank	400,425	Apr. 2	3	2	47	3
Anderson, Joseph, assignor to O'Hara Glass Company, (limited,) Pittsburg, Pa. Apparatus for shaping glassware	401,099	Apr. 9	1007	268, 269	47	199
Anderson, Joseph K., assignor of two-thirds to F. B. and C. H. Reeves, Philadelphia, Pa. Hanger for mirrors of bureaus	401,921	Apr. 23	2278	591	47	460
Anderson, Josiah B., Boston, Mass. Paper waxing and cutting machine	404,151	May 28	2419	634	47	1152
Anderson, Rufus, Ithaca, N. Y. Drawing pen and pencil	405,650	June 18	1930	508	47	1621
Andersson, Carl E. K., New York, N. Y. Fly-catcher	404,946	June 11	838	218	47	1397
Andre, Emil, assignor to F. Heuser & Co., Hanover, Germany. Pressure regulating or reducing valve	404,586	June 4	334	80	47	1228
André, Reuben. (See Oriatt, Solomon E., assignor.)						
Andresen, Blatt & Co. (See Müller, Frederick E., assignor.)						
Andresen, Momme, assignor to Actien-Gesellschaft für Anilin Fabrikation, Berlin, Germany. Manufacture of a new alpha-naphthol-disulphonic acid	405,938	June 25	2356	.....	47	1705
Andrew, Moses L., Delhi, Ohio. Drill-chuck	403,063	May 14	786	209	47	819
Andrews, Benjamin, New Orleans, La. Well-borer	401,404	Apr. 16	1478	391	47	301
Andrews & Company, A. H. (See Schustek, Daniel, assignor.)						
Andrews Manufacturing Company. (See Old, Anaborn F., assignor.)						
Andrews, Marion A. (See Grant, David G., assignor.)						
Angell, Edward F., Chicago, Ill. Book-leaf or paper holder	400,627	Apr. 2	285	80	47	59
Angerer, Victor. (See Herbert and Angerer.)						
Angevine, Lewis, Sweden Valley, Pa. Handle for dust-pans	402,292	Apr. 30	2833	734	47	576
Annin, Joseph, Brooklyn, N. Y. Metallic wheelbarrow	400,534	Apr. 2	158	41	47	33
Anson, William, Birmingham, county of Warwick, England. Breech-loading fire-arm	401,101	Apr. 9	1010	270, 271	47	200
Ansonia Clock Company. (See Davies, Walter D., assignor.)						
Anthony & Company, E. & H. T. (See Decker, Jacob P., assignor.)						
Anthony & Company, E. & H. T. (See Lewis, William H., assignor.)						
Applen, Henry, Saratoga, Ill. Rotating grain-meter	405,689	June 25	1996	524	47	1638
Arch, John H., Jackson, Iowa. Motor	403,317	May 14	1168	310	47	892
Arenberg, Herman, assignor of one-half to G. J. Clark, Edgwood, Cal. Vehicle	404,461	June 4	1 6	32	47	1251
Arents, Albert, Alameda, Cal. Fly-catcher	402,382	Apr. 30	2774	771	47	602
Arkell, James, assignor to S. H. Arkell, Canajoharie, N. Y. Paper bag	405,067	June 11	1017	272	47	1435
Arkell, James, assignor to S. H. Arkell, Canajoharie, N. Y. Soft-tie paper bag	405,068	June 11	1019	272	47	1435
Arkell, Sarah H. (See Arkell, James, assignor.)						
Armour, Michael C., Chicago, Ill. Steam-generator	401,102	Apr. 9	1012	271	47	200
Armour, Michael C., assignor to G. M. Clark & Company, Chicago, Ill. Broiler	403,407	May 14	1311	342	47	918
Armstrong, Charles E., assignor to J. A. King, Nevada, Iowa. Device for converting motion	401,103	Apr. 9	1014	271	47	201
Armstrong, Frederick. (See Lewis and Armstrong.)						
Armstrong, George D., Belleville, Ontario, Canada. Shingle or sheet-metal painting machine	400,426	Apr. 2	4	2	47	4
Armstrong, John J., and A. S. Lowrey, Weimar, Tex. Corn or cotton planter	401,798	Apr. 23	1867	521	47	407
Armstrong, Lewis D., Lock Haven, Pa. Apparatus for reclaiming soda-ash	402,642	May 7	131	32	47	689
Armstrong, Samuel F., Adamsville, assignor to C. Rogers, Edwardsburg, Mich. Crank for motors	402,052	Apr. 23	2473	645	47	497
Arndt, Henry, and F. Stutzman, Williamsport, Pa. Treadle saw-feeder	402,383	Apr. 30	2675	772	47	602
Arndt, Theophilus, Florin, Pa. Vegetable-slicer	404,883	June 11	751	191	47	1379
Arnett, Calvin W. (See Arnett, William E. and C. W.)						
Arnett, William E. and C. W., Fairmont, W. Va. Fence	404,026	May 28	2208	580	47	1109
Arnold, Charles H. (See Kelly, William J., assignor.)						
Arnold, Don J., assignor of one-half to H. B. Coryell, Omaha, Nebr. Galvanic battery	403,868	May 21	1981	580	47	1057
Arnold, Eliphaz W., and G. W. Osgood, Weymouth, Mass. Last	403,962	May 28	2146	561	47	1097
Arnold, Horace L., Hartford, Conn., assignor to R. S. Woodruff, trustee, Trenton, N. J. Book-stitching	401,673	Apr. 16	1900	495	47	378
Arnold, Horace L., Hartford, Conn., assignor to R. S. Woodruff, trustee, Trenton, N. J. Stitching books	401,674	Apr. 16	1900	495	47	379
Arnold, Horace L., Hartford, Conn., assignor to R. S. Woodruff, trustee, Trenton, N. J. Stitching books	401,675	Apr. 16	1902	496	47	379
Arnold, Horace L., Hartford, Conn., assignor to R. S. Woodruff, trustee, Trenton, N. J. Stitching books	401,676	Apr. 16	1903	496	47	379
Arnold, Horace L., Hartford, Conn., assignor to R. S. Woodruff, trustee, Trenton, N. J. Book-stitching	402,218	Apr. 30	2731	708	47	557
Arnold, James. (See Seely, Horace C., assignor.)						
Arnold, John T., Hyde Park, Ill. Valve-gear	405,939	June 25	2358	618	47	1706
Arnold, Rollin H., Honeoye, N. Y. Reclining-chair	403,318	May 14	1169	310	47	893
Arnold, William H., Troy, N. Y. Device for indicating the measure of retardation applied to arrest the momentum of a train	404,947	June 11	839	219	47	1398
Arnold, William R. (See Greaves, James W., assignor.)						
Arrington, Arthur. (See Newell, George W., assignor.)						
Arzt, Edward, Chicago, Ill. Box-making machine	403,821	May 21	1913	503	47	1045
Aschenbach, Bruno, assignor of one-half to G. L. H. Mueche, St. Joseph, Mo. Window	400,427	Apr. 2	5	3	47	4
Aschenbach, Henry, South Orange, and J. W. Theobald, Newark, N. J. Harness-saddle	404,609	June 4	442	111	47	1311
Aschener, Friedrich, assignor to Electric Cutlery Company, New York, N. Y. Razor	404,763	June 4	565	144	47	1337
Ash, William H., Brooklyn, N. Y. Book-holder	400,628	Apr. 2	285	81	47	59
Ashby, Charles M., De Smet, Dak. Ter. Awning-frame	401,104	Apr. 9	1016	272	47	201
Ashby, D. (See Leibel, Joseph C., assignor.)						
Ashley, Howard M., Ferrybridge, county of York, England. Manufacture of glass bottles, &c.	403,023	May 7	681	179	47	792
Ashley, Howard M., Ferrybridge, county of York, England. Machinery for making glass bottles, &c.	403,024	May 7	684	180	47	792
Ashley, Howard M., Ferrybridge, county of York, England. Machinery for making glass bottles, &c.	403,025	May 7	686	180	47	793
Ashley, Howard M., Ferrybridge, county of York, England. Manufacture of bottles, &c.	403,026	May 7	689	.....	47	793
Ashley, Howard M., Ferrybridge, county of York, England. Machinery for making glass bottles, &c.	403,027	May 7	690	181	47	794
Ashley, Howard M., Ferrybridge, county of York, England. Machinery for making glass bottles, &c.	403,716	May 21	1735	461, 462	47	1013

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Ashley, Howard M., Ferrybridge, county of York, England. Machinery for making glass bottles, &c.	403,717	May 21	1757	462, 463	47	1014
Ashley, Howard M., Ferrybridge, county of York, England. Machinery for making glass bottles, &c.	403,718	May 21	1761	463	47	1015
Ashley, Howard M., Ferrybridge, county of York, England. Machine for making glass bottles	403,719	May 21	1765	464	47	1015
Ashworth, Elijah. (See Ashworth, George and E.)						
Ashworth, Elijah, Manchester, county of Lancaster, England. Machine for securing clothing to carding-engines	404,587	June 4	336	20, 21	47	1289
Ashworth, George and E., Manchester, county of Lancaster, England. Making card-teeth	401,991	Apr. 23	2377	618	47	480
Ashworth, George and E., Manchester, county of Lancaster, England. Driving mechanism for carding-engines	403,720	May 21	1766	464	47	1015
Ashworth, George and E., Manchester, county of Lancaster, England. Driving mechanism for carding-engines	403,721	May 21	1767	464, 465	47	1016
Athey, Isaac H., Marion, Ark. Fire-escape	402,053	Apr. 23	2474	645	47	497
Atkinson, Charles W. (See Murphy and Atkinson.)						
Atkinson, Dwight R., Albany, assignor of one-half to J. E. Dodge, Waterford, N. Y. Rail-joint	404,764	June 4	565	145	47	1337
Atkinson, F. M. (See Kerr, John W., assignor.)						
Atteaux, Frederick E., trustee. (See Wilder, Charles H., assignor.)						
Atwater, Richard, Meriden, Conn. Rule-working machine	400,818	Apr. 2	587	160	47	112
Atwater, Richard M., and E. Hereckner, Millville, N. J., assignors to Whitall, Tatum & Co., Philadelphia, Pa. Mold for glassware	405,863	June 25	2236	588	47	1686
Atwood, John W., Wauregan, Conn. Sash-fastener	400,535	Apr. 2	161	41	47	34
Atwood, La Motte C., assignor of one-half to F. T. Robinson, St. Louis, Mo. Arc lamp	404,244	May 28	2575	671	47	1180
Atwood, La Motte C., assignor of three-fourths to F. and L. Skrainka and E. B. Roth, St. Louis, Mo. Electric-arc lamp	404,245	May 28	2578	671, 672	47	1180
Atwood, Leonard, Philadelphia, Pa. Valve	401,240	Apr. 9	1225	326, 327	47	240
Atwood, Lewis J., assignor to Plume & Atwood Manufacturing Company, Waterbury, Conn. Argand lamp	400,819	Apr. 2	589	161	47	112
Atwood, Lewis J., and F. W. Tobey, assignors to Plume & Atwood Manufacturing Company, Waterbury, Conn. Lamp-holder	405,368	June 18	1493	396	47	1534
Austin, David R. (See Smallwood and Austin.)						
Austin, Frederick C. (See Bunnell, Morton G., assignor.)						
Austin, Frederick C. (See Chapman, Thomas G., assignor.)						
Austin, Frederick C. (See Crollard, Jules, assignor.)						
Austin, Frederick C. (See Hunt, James W., assignor.)						
Austin, Frederick C. (See Miller, George N., assignor.)						
Austin, Frederick C. (See Monts, Ortus E., assignor.)						
Austin, John, Fenelon Falls, Ontario, Canada. Latch and lock combined	405,241	June 18	1283	340	47	1491
Austin, Lloyd W., Milwaukee, Wis. Shoe-nail	405,737	June 25	2050	538	47	1648
Austin, Robert A., Sandusky, Ohio. Hose-coupler	402,219	Apr. 30	2732	708	47	557
Austin, Samuel E., Fort Valley, Ga. Adding-machine	403,900	May 28	2031	535, 536	47	1075
Autenrieth, Ernst F. (See Welch and Autenrieth.)						
Autenrieth, Ernst F., New York, assignor to Glen Cove Machine Company, (limited,) Brooklyn, N. Y. Belt-tightener for planing-machines	401,677	Apr. 16	1904	496	47	379
Autenrieth, Ernst F., New York, assignor to Glen Cove Machine Company, (limited,) Brooklyn, N. Y. Planing-machine	404,948	June 11	840	219	47	1398
Autenrieth, Ernst F., New York, assignor to Glen Cove Machine Company, (limited,) Brooklyn, N. Y. Planing and molding machine	405,389	June 18	1495	396, 397	47	1535
Autenrieth, Ernst F., New York, assignor to Glen Cove Machine Company, (limited,) Brooklyn, N. Y. Planing-machine	405,390	June 18	1496	397	47	1535
Automatic Perfume Fountain Company. (See Everitt, Percival, assignor.)						
Automatic Selling Machine Company. (See Bailey, Henry, assignor.)						
Automatic Vending Box Company. (See O'Kelly, James M., assignor.)						
Autrobus, John H., Ottumwa, Iowa. Door or window screen wiring machine	402,884	May 7	489	129	47	755
Avedyk, Octave, Louvain, Belgium. Manufacturing and bottling aerated water	404,462	June 4	137	32	47	1251
Avery, George H., East Hampton, Mass. Making leather washer-coils	404,949	June 11	841	219	47	1398
Avis, Walter H., York, Ontario, Canada. Grooved pulley	405,651	June 18	1931	508	47	1621
Axtell, Henry A., Montagne, Mass. Grindstone and mechanism for the same	404,670	June 4	443	111	47	1311
Ayer, Alfred, Lake Weir, Fla. Orange-grader	401,241	Apr. 9	1227	327	47	241
Aylesworth, William, 1st, assignor of one-third to J. H. Mold, Blossburg, Pa. Automatic wagon-brake	405,320	June 18	1710	451, 452	47	1579
Ayres, Hobart, St. Louis, Mo., assignor to P. Bent, Chicago, Ill. Scaffold	405,195	June 11	1208	321	47	1471
Baade, John, Waco, Tex. Mold for making sewers	405,652	June 18	1932	508	47	1621
Babbs, Frank H., *et al.* (See Taylor, Elbert C., assignor.)						
Babcock, Edward G., New Britain, Conn. Display-rack	402,885	May 7	490	129	47	755
Babcock, Isaac B., Newport Centre, Vt. Roller for leveling snow or roads	404,671	June 4	445	112	47	1311
Babcock, Stephen E., Little Falls, N. Y. Drinking-fountain	402,553	May 7	2	1	47	663
Babcock, William A., South Coventry, Conn. Valve	404,885	June 11	754	192	47	1380
Babé, Désiré A., Paris, France. Bicycle	401,105	Apr. 9	1017	272	47	201
Back, John R., Worcester, Mass. Metal-turning lathe	400,829	Apr. 2	591	161	47	113
Backer, Charles R., Evansville, Ind. Guide for band-saws	403,172	May 14	930	242, 243	47	844
Backman, Per G., Paris, France. Safety device for elevators	401,106	Apr. 9	1018	273	47	201
Backstrom, Charles A., New York, N. Y. Incandescent lamp	404,816	June 11	646	168	47	1302
Backus Water Motor Company. (See Cissel, Robert B., assignor.)						
Bacot, Richard D., Columbia, S. C. Rail	401,107	Apr. 9	1019	273	47	202
Badische Anilin and Soda Fabrik. (See Bohn, René, assignor.)						
Baechtold, Christian. (See Bosworth, Percy B., assignor.)						
Baer, Joseph S., *et al.* (See Colby, Edward J., assignor.)						
Bagby, William H., Waco, Tex. Combination railway cross-tie	403,634	May 21	1637	433	47	900
Bagley, Charles, Mechanicsville, Iowa. Pump	400,428	Apr. 2	6	3	47	4
Bailey, Charles J., Newton, Mass. Brush	404,588	June 4	339	81	47	1289
Bailey, Charles J., Newton, Mass. Bath-brush	405,295	June 18	1364	359	47	1508
Bailey, Charles J., Newton, Mass. Brush	405,296	June 18	1365	359	47	1508
Bailey, Charles J., Newton, Mass. Swab or cleaner for guns	405,297	June 18	1366	360	47	1508
Bailey, Farrell & Co. (See Wichelhaus, Friedrick, assignor.)						
Bailey, Frank M., assignor to Stanley Rule and Level Company, New Britain, Conn. Bench-plane	401,532	Apr. 16	1671	441	47	337
Bailey, Frank M., assignor to Stanley Rule and Level Company, New Britain, Conn. Bench-plane	402,886	May 7	491	129	47	755

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Bailey, George W. (See Leibersperger and Bailey.)						
Bailey, Henry, assignor, by mesne assignments, to Automatic Selling Machine Company, New York, N. Y. Vending apparatus	402,644	May 7	132	32	47	689
Bailey, Henry C., Edinburg, Ind. Adjustable split pulley	403,901	May 28	2038	536	47	1076
Bailey, Henry C., Edinburg, Ind. Adjustable split pulley	403,902	May 28	2039	536	47	1076
Bailey, Henry T., Scituate, Mass. Support for drawing models	405,298	June 18	1366	360	47	1508
Bailey, John S., Buckingham, Pa. Highway-sign	403,722	May 21	1769	465	47	1016
Bailey, Marcellus, Washington, D. C., assignor to Eagle Pencil Company, New York, N. Y. Lead or crayon holder	405,521	June 18	1711	451, 452	47	1580
Bailey, William H., Salford, county of Lancaster, England. Apparatus for the delivery of prepaid goods	400,536	Apr. 2	162	42	47	34
Bailey, William H., Pittsburg, Pa. Annealing-box	405,755	June 25	2093	548	47	1657
Bailley, Ferdinand, Schenectady, N. Y. Fitting commutator-bars	400,994	Apr. 9	858	230	47	173
Baily, Mifflin W., Pottstown, Pa. Steam-boiler	405,864	June 25	2237	589	47	1686
Bain, Forée, assignor, by mesne assignments, to Electric Cutting Machine Company, Chicago, Ill. Regulation of electric motors	400,890	Apr. 9	698	189	47	145
Bain, Robert E. M., St. Louis, Mo. Apparatus for coating photographic plates with emulsion	401,771	Apr. 23	2046	535, 536	47	418
Bain, Robert E. M., St. Louis, Mo. Shutter for photographic cameras	404,375	June 4	5	1	47	1225
Baines, Hugh, Brooklyn, N. Y. Car for live stock	401,678	Apr. 16	1906	497	47	380
Baird, Edward A. (See Jameson and Baird.)						
Baird, John, New York, N. Y. Steam-boiler	402,127	Apr. 30	2691	673, 674	47	531
Baird, John, New York, N. Y. Steam-boiler	402,887	May 7	492	130	47	755
Baird, Robert H. (See Morgan and Baird.)						
Bairstow, John. (See Shaffer and Bairstow.)						
Baker, Charles E. (See Baker, Thomas J. and C. E.)						
Baker, Daniel B., Rising Sun, Ohio. Buckle	400,891	Apr. 9	700	189	47	145
Baker, Eugene. (See Stone and Colman, assignors.)						
Baker, Frank C., Blue Island, Ill. Switch-stand	402,293	Apr. 30	2834	734	47	576
Baker, George W., Cleveland, Ohio. Sewing-machine take-up	403,723	May 21	1770	465	47	1016
Baker, George W., Wilmington, Del. Leather-dressing machine	405,653	June 18	1933	508, 509	47	1621
Baker, Henry C. (See Smith, Henry W., assignor.)						
Baker, Jacob, Greenville, Ohio. Centrifugal force-pump	405,294	June 18	1361	358, 359	47	1507
Baker, James H., Savannah, Mo. Mechanical movement	405,756	June 25	2093	549	47	1657
Baker, Nathan H., Providence, R. I. Blank-book	404,817	June 11	647	168	47	1302
Baker, Thomas J. and C. E., Findlay, Ohio. Combined wrench and piston-lubricator	403,408	May 14	1342	343	47	918
Baker, William. (See Rider, Charles M., assignor.)						
Baker, William H., assignor of one-half to S. W. Smith, Pontiac, Mich. Lap-ring	402,384	Apr. 30	2976	772	47	602
Baker, William J., Tiffin, Ohio. Screw-cutting die-head	401,108	Apr. 9	1021	273, 274	47	202
Baker, William R., Pasadena, Cal. Preserving fruit	401,109	Apr. 9	1022	.....	47	202
Baker, Wilson M., Urbana, Ohio. Knockdown case for eggs, &c	401,873	Apr. 23	2199	575	47	446
Balch, Samuel W., Yonkers, N. Y. Calendar	401,624	Apr. 16	1636	479	47	368
Baldwin Co., A. (See West, William Y., assignor.)						
Baldwin, George H., Grand Summit, Kans. Broom-making machine	402,385	Apr. 30	2976	773	47	602
Baldwin, George W., assignor of one-half to G. H. Stevenson, Schaghticoke, N. Y. Penholder	404,027	May 28	2209	580	47	1109
Baldwin, Hiram, and J. J. Smith, Toledo, Iowa. Ink-eraser	402,710	May 7	231	60	47	707
Baldwin, James S., Newark, N. J. Air-engine	404,818	June 11	649	168, 169	47	1302
Baldwin, John, Chicago, Ill. Making white lead	401,533	Apr. 16	1672	441	47	337
Baldwin, Judson A., Winooski, Vt. Latch	403,173	May 14	922	243	47	845
Baldwin, Luther C., Manchester, N. H. Spinning-bobbin, &c. (Reissue)	10,996	Apr. 23	2395	672	47	592
Baldwin, Stephen G., Marion, Ind. Ink-well	404,246	May 28	2580	672	47	1181
Baldwin, Stephen G., Marion, Ind. Ink-well	404,247	May 28	2581	672	47	1181
Baldwin, William J., Brooklyn, N. Y. Apparatus for heating and ventilating buildings	402,386	Apr. 30	2978	773, 774	47	603
Balet, Joseph W., assignor of one-half to R. Dunlap and L. F. Cozans, New York, N. Y. Regulating electric currents	400,726	Apr. 2	432	117	47	86
Ball, Albert, Claremont, N. H. Combined projectile and gas-check	405,690	June 25	1997	524	47	1639
Ball, Clinton M., Troy, and S. Norton, assignors of one-third to A. T. Porter, West Troy, N. Y. Separating ores by magnetism	404,332	May 28	2711	703	47	1305
Ball, Clinton M., Troy, and S. Norton, assignors of one-third to A. T. Porter, West Troy, N. Y. Magnetic ore-separator	404,333	May 28	2712	703, 704	47	1305
Ball, Clinton M., and S. Norton, assignors of one-third to A. T. Porter, West Troy, N. Y. Separating ores	404,334	May 28	2714	704	47	1305
Ball, Edward M., *et al.* (See Boisvert, Napoléon, assignor.)						
Ball, Edward M., South Berwick, Me., assignor to J. and H. E. Hamilton and N. Boisvert, Salmon Falls, N. H. Shuttle checking and relieving mechanism for looms	405,069	June 11	1020	272	47	1435
Ball, Jacob. (See Hohmeier and Ball.)						
Ball, Phinehas, assignor to Union Water Meter Company, Worcester, Mass. Rotary meter	404,374	June 4	2	1	47	1225
Ball, Thomas H., *et al.* (See Gardner, Marshall, assignor.)						
Ball, William, Lynchburg, Ohio. Gate	402,501	Apr. 30	3168	821	47	638
Ballantyne, James L., Newton, Mass., assignor to Nonantum Worsted Company, of Massachusetts. Dabbing-brush apparatus for combing-machines	404,376	June 4	6	2	47	1226
Ballinger, Levi G., East Liberty, Ohio. Carpet-stretcher	402,220	Apr. 30	2733	709	47	557
Ballou, Hiram P., assignor to L. Jones, Bristol, Pa. Circular rib-knitting machine	402,793	May 7	302	94, 95	47	731
Baltzley, Edwin, assignor to Keystone Manufacturing Company, Philadelphia, Pa. Motor for culinary beaters, mixers, &c.	403,502	May 21	1451	381	47	953
Bamford, Walter, Paterson, N. J. Warp-beaming machine	405,654	June 18	1934	509	47	1621
Bancroft, John. (See Bloede, Victor G., assignor.)						
Bandman, Isidore C., Atlanta, Ga. Artificial fuel	405,865	June 25	2239	.....	47	1686
Bang, Ivar A. F., and M. C. A. Rnffu, Paris, France. Purifying acetic acid	401,992	Apr. 23	2378	618	47	480
Banigan, Joseph. (See Donghty, Henry J., assignor.)						
Banker, George W., Brooklyn, N. Y. Packing-case	403,503	May 21	1453	381	47	953
Bannister, Louis H., assignor to Eastman Dry Plate and Film Company, Rochester, N. Y. Roller-holder for photographic films	405,454	June 18	1602	422	47	1556
Baptist, William, New Orleans, La. Device for handling logs and timber	400,728	Apr. 2	439	118	47	87
Baragwanath, Henry D., Chicago, Ill. Feed-water heater and purifier	402,645	May 7	134	32	47	689
Barber, Francis M., Washington, D. C. Car for transporting fruit	403,724	May 21	1771	465, 466	47	1016

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Barbig, Fernando, New York, N. Y. Lantern	402,794	May 7	365	95	47	731
Barbour, Charles, Verona, Pa. Adjustable leaf-holder	405,242	June 18	1284	340	47	1491
Barclay, Harry H. (See Jerrold and Barclay.)						
Barclay, Robert L., Brooklyn, N. Y. Machine for manufacturing turn-buckles	404,152	May 28	2421	634	47	1153
Bardeen, Charles W. (See Jones, Walter F., assignor.)						
Bardsley, William, Kearney, N. J. Table or stand for exhibiting cloaks, &c	401,110	Apr. 9	1023	274	47	202
Barker, Cassius M. (See Dicer and Barker.)						
Barker, David, Canton, Ohio. Mold for making glass pads for horse-collars	404,766	June 4	568	145	47	1337
Barker, David, assignor to Canton Glass Company, Canton, Ohio. Mold for vault-lights	404,765	June 4	567	145	47	1337
Barker, Erastus B., Newark, N. J. Photographic camera	402,711	May 7	232	61	47	707
Barker, John R., Chicago, Ill. Air-heating furnace	402,795	May 7	366	96	47	731
Barkley, John F. (See Myers, William H., assignor.)						
Barlow, Chloe H., executrix. (See Barlow, Warren S.)						
Barlow, Warren S., deceased, Paterson, N. J.; C. H. Barlow executrix. Door-check	401,534	Apr. 16	1673	441	47	337
Barnard, Edward, Rome, N. Y. Halter	401,922	Apr. 23	2279	591	47	460
Barnard, George, Chicago, Ill. Pocket for cartridges	401,923	Apr. 23	2281	592	47	461
Barnard, Heman A., assignor to Barnard & Leas Manufacturing Company, Moline, Ill. Middlings-purifier	401,942	Apr. 9	1229	327 / 328	47	241
Barnard, Heman A., assignor to Barnard & Leas Manufacturing Company, Moline, Ill. Roller-mill	401,943	Apr. 9	1231	328 / 329	47	241
Barnard & Leas Manufacturing Company. (See Barnard, Heman A., assignor.)						
Barnard & Leas Manufacturing Company. (See Cornwall, John B., assignor.)						
Barnes, Elbridge F., New Haven, Conn. Convertible machine for grooving and sawing wood	404,377	June 4	8	2	47	1226
Barnes, George A., New Haven, Conn. Friction-clutch	404,153	May 28	2422	634	47	1153
Barnes, George W., Philippi, W. Va. Brake-lever	403,983	May 28	2147	561	47	1097
Barnes, Joseph, Fall River, assignor to Dutcher Temple Company, Hopedale, Mass. Loom-temple	403,028	May 7	692	181	47	794
Barnes, Joshua, Brooklyn, N. Y. Medicine-dispenser	404,950	June 11	841	220	47	1398
Barnes, Joshua B., Springfield, Ill. Door for cinder-boxes	403,504	May 21	1454	382	47	953
Barnes, Joshua B., Springfield, Ill. Spark-arrester	403,984	May 28	2149	561	47	1098
Barnes, Monroe, Bloomington, Ill. Road-cart	404,672	June 4	446	112	47	1311
Barnes, Norman E., Bay Shore, N. Y. Picking-thimble for musical instruments	401,476	Apr. 16	1585	419	47	322
Barnes, William E., Florence, Mass. Plume	403,084	May 14	788	209	47	819
Barnet, Henry C., *et al.* (See Seibel, Frederick H., assignor.)						
Barnett, Barnard B., Woodruff, S. C. Machine for boring and drilling	403,240	May 14	1040	275	47	868
Barnett, William H., *et al.* (See Piggott, Henry E., assignor.)						
Barney, Benjamin P., Harper, Kans. Grain-cleaner	405,070	June 11	1021	272 / 273	47	1435
Barney, Frank L., Prairie du Chien, and H. E. Taylor, Bloomington, Wis. Dental plugger	402,294	Apr. 30	2835	734	47	576
Barney, Rufus L., Swanton, assignor of one-half to J. N. Baxter, Rutland, Vt. Stone-sawing machine	404,335	May 28	2715	704	47	1206
Barnhart Bros. & Spindler. (See Klemm, Henry, assignor.)						
Barnhart, Harvey P. and S. L., Potsdam, N. Y. Liquid transporting and measuring vessel	404,819	June 11	655	169	47	1363
Barnhart, Henry M. (See King and Barnhart.)						
Barnhart, Samuel L. (See Barnhart, Harvey P. and S. L.)						
Barnum, Alexander M., Buffalo, N. Y. Cylinder relief-valve	401,477	Apr. 16	1585	419	47	322
Baroutidis, George M., San Francisco, Cal. Teredo-proof covering for piles	403,409	May 14	1313	343	47	919
Barr, Nicholas, Cayuta, N. Y. Car-coupling	402,287	Apr. 30	2980	774	47	603
Barr, William C., Jr. (See Daly, Michael J., assignor.)						
Barreiras, Enrique S., Kirkwood, assignor to Buxton & Skinner Stationery Company, St. Louis, Mo. Currency-package	403,085	May 14	789	210	47	820
Barrett Battery Company, John A. (See Barrett, John A., assignor.)						
Barrett, Charles H., assignor of one-half to O. E. Curtis, Decatur, Ill. Adjustable window screen and frame	402,295	Apr. 30	2837	734	47	577
Barrett, Edward, Fall River, Mass. Boiler-furnace	404,378	June 4	9	3	47	1226
Barrett, Henry, and J. J. Varley, London, England. Means for facilitating the opening of internally-stoppered bottles	400,892	Apr. 9	701	180	47	145
Barrett, James, Boston, Mass. Set bowl or basin	405,818	June 25	2170	571	47	1672
Barrett, John A., Brooklyn, N. Y., assignor to J. A. Barrett Battery Company, Baltimore, Md. Catch for boxes, &c	403,029	May 7	693	181 / 182	47	794
Barrett, John A., Brooklyn, N. Y., assignor to J. A. Barrett Battery Company, Baltimore, Md. Electric battery	403,451	May 14	1371	360	47	929
Barrett, John A., Brooklyn, N. Y., assignor to J. A. Barrett Battery Company, Baltimore, Md. Galvanic battery	405,196	June 11	1210	321	47	1471
Barrett, William H., Fort Worth, Tex. Anti-freezing tank-valve	404,820	June 11	657	170	47	1363
Barrows, Charles H., Willimantic, Conn. System of rapid transportation	403,505	May 21	1455	383	47	954
Barrus, George H., Reading, Mass. Steam-calorimeter	401,111	Apr. 9	1025	274	47	203
Barry, Bernard, Schenectady, N. Y. Cheese-cutter	400,537	Apr. 2	163	42	47	34
Barry, David. (See Hadden and Barry.)						
Barry, James, assignor of part to W. H. H. and D. W. Tainter, Kansas City, Mo. Car-coupling	402,646	May 7	135	33	47	690
Barth, Gustav A., assignor to P. Chouteau, St. Louis, Mo. Valve for steam-engines	401,924	Apr. 23	2283	594	47	461
Bartholomew, George E., New Haven, Conn., assignor of one-third to E. R. Edwards, Cincinnati, Ohio. Vehicle-spring	402,888	May 7	493	131	47	756
Bartholomew, Harry S., Bristol, Conn. Bit-holder	405,522	June 18	1712	452	47	1580
Bartholomew, Thomas, Newark, Ohio. Hand printing apparatus	403,822	May 21	1915	503	47	1045
Bartlau, August R., assignor to W. Scott, Plainfield, N. J. Sheet-delivery apparatus for printing-machines	404,951	June 11	843	220	47	1398
Bartlett, Charles L., *et al.* (See Horsey, George F., assignor.)						
Bartlett, Edward L., *et al.* (See Fisher, Charles H., assignor.)						
Bartlett, Elbridge G. W. (See Venn, Isaac H., assignor.)						
Bartlett, Frederic. (See Schofield, Silas C., assignor.)						
Bartlett, James F., Chicago, Ill. Cash and package carrier	402,128	Apr. 30	2603	674	47	531
Bartlett, John S., assignor of one-half to S. H. Pitkin, Akron, Ohio. Direct-acting engine	404,248	May 28	2582	672	47	1181
Bartlett, John W., assignor of one-fourth to G. W. Walker, Moline, Ill. Type-writing machine	403,823	May 21	1917	503 / 504	47	1045
Bartlett, Jonathan. (See Wiggin and Bartlett.)						
Bartlett, Jonathan, Epping, and G. B. Wiggin, South New Market, N. H., assignors of one-half to J. W. Hoard, Providence, R. I. Presser-foot-lifting device for sewing-machines	403,725	May 21	1773	466	47	1016
Barton, David R., Centreville, Md. Fence-building	400,429	Apr. 2	9	3	47	5
Barton, Edward F., assignor of one-half to A. Coy, Ravenna, Ohio. Tongs	405,001	June 11	919	242	47	1414
Barton, Edwin W., assignor of one-half to E. Churchill, Lawrence, Mass. Adjustable carriage for Jordan engines and other machinery	405,523	June 18	1713	452	47	1580

Bayaud, Theodore W., *et al.* (See Peer, John A., assignor.)						
Bayles, James C., East Orange, N. J. Flux-carrier	405,866	June 25	2240	589	47	1686
Bayles, James E., New York, N. Y., assignor to Safety Car Heating and Lighting Company, of New Jersey. Pipe-coupling	400,822	Apr. 2	593	162	47	113
Bayless, William C., Mossy Creek, Tenn. Straw-cutter	404,379	June 4	10	3	47	1226
Bayley, Edward H. (See Lineff, Alexander L., assignor.)						
Bayley, George W., Brooklyn, N. Y. Extension light-fixture	401,925	Apr. 23	2285	592	47	461
Baynes, James B., and C. A. Hennicke, Buffalo, N. Y. Wagon-clip	401,478	Apr. 16	1587	419	47	322
Beach, Franklin G., Chicago, Ill. Telephone-exchange apparatus	405,867	June 25	2241	590	47	1686
Beach, Henry L., Hartford, Conn. Boiler front and setting	404,821	June 11	658	170	47	1363
Beacham, Frederick L., *et al.* (See Reams, John V., assignor.)						
Bealmear, James A., *et al.* (See Lumley, Edwin J., assignor.)						
Beals, Augustus, North Weymouth, Mass. Hammock	403,320	May 14	1171	311	47	893
Beam, Elias W., Plymouth, Mich. Road-cart	405,299	June 18	1368	360	47	1508
Beam, John C. (See Rudasill, Eli A., assignor.)						
Bean, John, Los Gatos, Cal. Spray-nozzle	400,730	Apr. 2	441	118	47	87
Bear, Philip L., Hamilton, Ohio. Oil-burner	405,391	June 18	1497	397	47	1535
Beason, Albert E., Audubon, Iowa. End-gate for wagons	403,241	May 14	1041	275	47	868
Beavan, Fred W. (See Peaslee and Beavan.)						
Bebb, George, assignor to G. and W. Merritt, Indianapolis, Ind. Doffer-cleaner for carding-machines	401,811	Apr. 23	2118	552	47	429
Becker, Henry L. (See Gallinowsky, Hugo, assignor.)						
Beckert, William, Allegheny, Pa. Bed	402,129	Apr. 30	2604	674 / 675	47	532
Beckfeld, J. Charles. (See Schmid and Beckfeld.)						
Beckfeld, John C. (See Schmid, Siegfried, and Beckfeld.)						
Beckwith, Eugene K., Niantic, assignor of one-half to F. B. Wright, Meriden, Conn. Combination-tool	403,031	May 7	696	182	47	795
Bedford, George P., assignor of one-half to W. L. Savage, New York, N. Y. Adjustable foot-rest	402,130	Apr. 30	2605	675	47	532
Bedford, William G., Philadelphia, Pa. Apparatus for generating gas	404,856	June 11	755	192	47	1380
Beebe, Edgar C., and R. Stoner, Glen Elder, Kans. Windmill	400,995	Apr. 9	860	220 / 221	47	173
Beerbower, George M., Cherry Vale, Kans. Poultry-carrier	401,812	Apr. 23	2139	552	47	430
Beeson, Volney W., and W. B. Bonine, Perry, Iowa. Steam-engine	402,689	May 7	494	131	47	756
Behlen, Charles A., Cincinnati, Ohio. Vehicle-spring	403,506	May 21	1460	383	47	955
Behm, Joseph, West Point, Cal. Amalgamator	405,337	June 18	1421	374	47	1520
Behrend, Bendeza J. (See Johnson, Henry, assignor.)						
Beichling, Henry, Wilkeson, Wash. Ter. Pen	404,249	May 28	2583	673	47	1181
Belches, Richard, Haymarket, Va. Spring-hinge	402,388	Apr. 30	2982	774	47	604
Belches, Richard, Haymarket, Va. Fire-escape	402,389	Apr. 30	2983	775	47	604
Beldam, Aeplan, London, county of Middlesex, England. Pump-valve	402,647	May 7	137	33, 34	47	690
Belden, Benjamin W., assignor of one-half to G. J. Meyer, St. Louis, Mo. Frame for building-blocks or paving-tiles	400,996	Apr. 9	862	221	47	174
Belden, Russell A., New Haven, Conn. Power-hammer	403,453	May 14	1374	360	47	930
Belding Motor and Manufacturing Company. (See Belding, Warren S., assignor.)						
Belding Motor and Manufacturing Company. (See Slater, Henry B., assignor.)						
Belding, Warren S., assignor to Belding Motor and Manufacturing Company, Chicago, Ill. Electric motor	404,067	May 28	2293	600	47	1127
Belding, Warren S., assignor to Belding Motor and Manufacturing Company, Chicago, Ill. Dynamo	404,068	May 28	2296	601 / 602	47	1127
Belding, Warren S., assignor to Belding Motor and Manufacturing Company, Chicago, Ill. Clamp for electric motors	404,069	May 28	2299	602	47	1128
Belfield, Reginald, assignor to Westinghouse Electric Company, Pittsburg, Pa. Lightning-arrester	404,154	May 28	2424	634	47	1153
Bell, Charles C. (See Rogers, Frederick H., assignor.)						
Bell, George W., River Falls, Wis. Middlings-purifier	400,538	Apr. 2	163	42, 43	47	34
Bell, Harold J., Gloucester City, N. J., assignor to Welsbach Incandescent Gas Light Company, of New Jersey. Gas-governor	401,626	Apr. 16	1839	480	47	368
Bell, Harold J., Gloucester City, N. J., assignor to Welsbach Incandescent Gas Light Company, of New Jersey. Gas-governor	401,627	Apr. 16	1840	480	47	369
Bell, Harold J., Gloucester City, N. J., assignor to Welsbach Incandescent Gas Light Company, of New Jersey. Gas-governor	401,628	Apr. 16	1842	480	47	369
Bell, Henry O. (See Newhouse, Casey, assignor.)						
Bell, John A., Naperville, Ill. Commode	401,629	Apr. 16	1843	480	47	369

Bergendahl, Lewis J., Pendleton, Oreg. Pipe-wrench	401,926	Apr. 23	2286	593	47	462
Berger, Benjamin F., South Bend, Ind. Cultivator	401,114	Apr. 9	1031	276	47	204
Berger, Henry L., Vermilion Parish, and E. Noël, Abbeville, La. Centrifugal governor	405,760	June 25	2097	550	47	1658
Berger, William H., Philadelphia, Pa. Handle for saucepans	402,131	Apr. 30	2606	675	47	532
Bergman, Solomon, *et al.* (See Lovejoy, De Soto, assignor.)						
Bergmann & Company. (See Bergmann, Sigmund, assignor.)						
Bergmann, Ignaz, Fort Madison, Iowa. Pen guide or rest	402,796	May 7	367	97	47	732
Bergmann, Sigmund, New York, N. Y., assignor to Bergmann & Company, of New York. Electric switch	400,732	Apr. 2	443	119	47	88
Bergmann, Sigmund, New York, N. Y., assignor to Bergmann & Company, of New York. Switch for electric circuits	400,733	Apr. 2	444	119	47	88
Berliner Maschinenbau-Actien-Gesellschaft, vormals L. Schwartzkopff. (See Kaselowsky, Emil, assignor.)						
Bernardin, Alfred L., Evansville, Ind. Toy	405,868	June 25	2246	590	47	1687
Bernd, Adolph, *et al.* (See Levy, William M., assignor.)						
Berrang, Jacob C., Asbury Park, N. J. Insulator	403,727	May 21	1776	467	47	1017
Berrie, Robert B., Lexington, Mo. Paving-block	400,997	Apr. 9	864	232	47	174
Berry, Albert G., Washington, D. C. Rod-coupler	402,132	Apr. 30	2607	675	47	532
Berry, Charles E. (See King, William T., assignor.)						
Berry, Eugene, and H. Lambert, assignors of one-third to J. Marhoffer, Crescent City, Cal. Bundle-binder	404,155	May 28	2425	635	47	1153
Berry, John, assignor to National Needle Company, Springfield, Mass. Needle-grooving machine	404,336	May 28	2716	704, 705	47	1206
Berry, John, assignor to National Needle Company, Springfield, Mass. Needle-machine	404,337	May 28	2718	705	47	1206
Berry, Marcellus F., Brooklyn, N. Y. Memorandum-book	401,115	Apr. 9	1033	276	47	204
Bertrand, Ernst, Kladno, Bohemia, Austria-Hungary, assignor to Pottstown Iron Company, Pottstown, Pa. Repairing converter-bottoms	403,392	June 18	1499	398	47	1535
Berwick, William, Fall River, Mass. Governor for steam-engines	402,892	May 7	498	132	47	756
Besemer, Andrew A., Tecumseh, Mich. Water-motor	402,655	Apr. 23	2476	645, 646	47	498
Bessemer Steel Company. (See Reese, Jacob, assignor.)						
Beasler, George J., *et al.* (See McFarlane, John, assignor.)						
Best, Ezra. (See Butler, James C., assignor.)						
Best, F. J. (See Campbell, John A., assignor.)						
Betts, Lewis F., New York, N. Y. Machine for finishing metal tubes	402,133	Apr. 30	2609	676	47	532
Betts, Lewis F., assignor of two-thirds to R. E. Deits Company, New York, and Steam Gauge and Lantern Company, Rochester, N. Y. Tubular lantern	401,116	Apr. 9	1034	276	47	204
Betts, Rodney L., Brunswick, N. Y. Horse-tail holder	405,941	June 25	2360	618	47	1706
Bevens, John, Marine Mills, Minn. Draft-equalizer	403,635	May 21	1638	434	47	990
Bevier, B. S. (See Middleton, John A., assignor.)						
Bevin, Leander A., *et al.* (See Rider, Thomas J., assignor.)						
Bevinger, William H., Middletown, Ohio. Hip-belt	405,761	June 25	2098	550	47	1658
Beyett, John, *et al.* (See Black, William J., assignor.)						
Bianchi, Francis, assignor of one-half to L. Boyer, New Orleans, La. Diffusion apparatus	402,656	Apr. 23	2478	646, 647	47	498
Bibb, Peyton B. (See Woodward and Bibb.)						
Bickford, Chancla M. (See Lockwood and Bickford.)						
Bickford, Charles, Boston, Mass. Time-piece dial	400,734	Apr. 2	446	119	47	88

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Bickford, Erskine F., assignor to Boston Rubber Shoe Company, Malden, Mass. Rubber boot or shoe	401,246	Apr. 9	1238	330	47	243
Bickford, Erskine F., assignor to Boston Rubber Shoe Company, Malden, Mass. Rubber boot	404,674	June 4	449	113	47	1312
Bidwell, Charles H., Albion, N. Y. Bean-thrashing machine	402,803	May 7	500	132	47	757
Bigelow, James A., Melbourne, Victoria, assignor to J. H. Nathan, Sidney, New South Wales. Construction of beer-engines	401,406	Apr. 16	1481	392, 393	47	302
Bigham, Ambrose W. (See Paty and Bigham.)						
Bill, Charles H., Waltham, Mass. Scuffle-hoe	404,156	May 28	2426	635	47	1154
Bill, Jeremiah C., Willimantic, Conn. Automatic clutch and tension machine	400,998	Apr. 9	864	232	47	174
Billberg, Carl O. C., Philadelphia, assignor to T. H. and G. A. Dallett, Thornbury, Pa. Dynamo-armature	401,632	Apr. 16	1847	481	47	370
Billing, William H., assignor of two-thirds to A. Callie and E. A. Owen, East Saginaw, Mich. Cash-carrier	404,887	June 11	757	193	47	1381
Billings, George S., Lyons, Colo. Wagon-gear	405,819	June 25	2171	571	47	1673
Billups, Cealy, Norfolk, Va. Plow	402,390	Apr. 30	2986	775	47	604
Binns, Robert. (See Stevens, Joel W., assignor.)						
Bing, Ludwig, Berlin, Germany. Indicator for card-players	405,762	June 25	2100	550	47	1659
Bingham, Solon, Conklingville, assignor to A. A. Sumner, Albany, N. Y. Wash-board	400,823	Apr. 2	596	162	47	114
Binsfeldt, Louis, and J. Chateau, Detroit, Mich. Combined door lock and hinge	404,590	June 4	340	82	47	1289
Birch, George A., East Greenbush, N. Y. Snow-scraper	404,952	June 11	844	220	47	1309
Birch, James H., Plattsburg, Mo. Double-pointed pin	404,675	June 4	449	113	47	1312
Birckhead, Lennox, Toledo, Ohio. Steam-pipe joint for excavating-machines	402,555	May 7	3	2	47	664
Bird, James P. (See Rounds, Benjamin F., assignor.)						
Bird, Richard C. (See Page and Bird.)						
Bird, William E., Boston, Mass. Sand-molding machine	400,893	Apr. 9	702	190	47	145
Birdsall, Edgar M., assignor to M. Birdsall, Buffalo, N. Y. Traction-wheel	403,321	May 14	1179	311	47	893
Birdsall, Edgar M., assignor to M. Birdsall, Buffalo, N. Y. Valve-gear	403,435	May 14	1377	361	47	930
Birdsall, Edgar M., assignor to M. Birdsall, Buffalo, N. Y. Traction-engine	404,157	May 28	2427	635, 636	47	1154
Birdsall, Mary. (See Birdsall, Edgar M., assignor.)						
Birely, James G., Oshkosh, Wis. Flat-roofed building	400,431	Apr. 2	11	4	47	5
Birkholz, Hans, assignor to E. P. Allis, Milwaukee, Wis. Apparatus for casting chill-rings	404,888	June 11	758	193	47	1381
Birkholz, Hans, assignor to E. P. Allis, Milwaukee, Wis. Apparatus for casting chilled corrugated rollers	404,889	June 11	759	193	47	1381
Bischoff, Hugo. (See Mieg and Bischoff.)						
Bishop, George H., Revere, Mass. Blacking for boots or shoes	405,763	June 25	2101	.....	47	1659

Blydenburgh, Charles M., Riverhead, N. Y. Vehicle-spring	403,323	May 14	1174	312	47	894
Blyth, James F. (See Newall and Blyth.)						
Boardman, George B., Chicago, Ill. Covering for boilers	402,798	May 7	370	98	47	732
Bobrick, Gabriel A., Boston, Mass. Desk and chair for schools	404,250	May 28	2583	673	47	1181
Bobrick, Gabriel A., Boston, Mass. Dissolving gum-copal, &c	404,251	May 28	2585	.....	47	1722
Bock, Martin, Hazleton, Pa. Key for time-pieces	405,004	June 11	922	244	47	1414
Boda, William J., Dayton, Ohio. Door-hanging	403,572	May 21	1552	409	47	973
Boda, William J., Dayton, Ohio. Finishing of house interiors	403,573	May 21	1554	409, 410	47	973
Boddiker, Henry, Chicago, Ill. Danger-gate	402,799	May 7	371	98	47	732
Bode, Peter J., Belleville, Ill. Pump	403,507	May 21	1462	383	47	955
Bodefeld, Meinolph, St. Louis, Mo. Pneumatic railway	403,729	May 21	1778	467, 468	47	1018
Bodine Roofing Company. (See Jameson, Charles B., assignor.)						
Boekel, Julius. (See Boekel, William and J.)						
Boekel, William and J., Philadelphia, Pa. Gas or lamp bracket	403,508	May 21	1463	383, 384	47	955
Boekelman, Bernard, New York, N. Y. Musical notation	402,225	Apr. 30	2740	710	47	558
Boelling, Wilhelm, Berlin, Germany. Flooring-block	401,479	Apr. 16	1588	420	47	322
Boenker, Henry H., St. Charles, Mo. Automatic grain-weighing machine	401,118	Apr. 9	1036	277	47	205
Boettner, Charles W., and H. H. Gilchrist, Little River, Ark. Cloth-cutting apparatus	402,652	May 7	144	35	47	691
Bogardus, Charles A. (See Saltmarsh and Bogardus.)						
Boggs, Henry H., assignor to Hemingway Manufacturing Company, Syracuse, N. Y. Cooking apparatus	401,480	Apr. 16	1589	420	47	323
Bogge, William H., Covington, Ohio. Land-marker	401,679	Apr. 16	1908	497	47	380
Bogle, Walter S., Chicago, Ill. Loading and hoisting bucket	402,134	Apr. 30	2610	676	47	533
Bogler, Philip, Stewart, Minn. Car-coupling	402,391	Apr. 30	2988	774	47	604
Bohmann, Joseph, Chicago, Ill. Arm-rest for musical instruments	401,814	Apr. 23	2122	553	47	430
Bohn, René, Ludwigshafen-on-the-Rhine, Bavaria, assignor to Badische Anilin and Soda Fabrik, Mannheim, Germany. Alizarine-blue green	401,633	Apr. 16	1848	.....	47	370
Bohn, René, Ludwigshafen-on-the-Rhine, Bavaria, assignor to Badische Anilin and Soda Fabrik, Mannheim, Germany. Carbazol-yellow	401,634	Apr. 16	1849	.....	47	370
Bohn, René, Ludwigshafen-on-the-Rhine, Bavaria, assignor to Badische Anilin and Soda Fabrik, Mannheim, Germany. Alizarine-green sulpho-acid	401,635	Apr. 16	1851	.....	47	370
Bohnenstiel, Casper, Newport, Ky. Stem winding and setting watch	401,815	Apr. 23	2123	553	47	430
Boice, Alvin S., New Richland, Minn. Lock	404,516	June 4	226	54	47	1267
Boice, James A., Nevada, Mo. Lifting-jack	401,119	Apr. 9	1038	277	47	205
Bolleau, Etienne, assignor to L. J. Peck, St. Louis, Mo. Grate-bar for furnaces	403,730	May 21	1781	468, 469	47	1018
Boisvert, Napoleon, *et al.* (See Ball, Clinton M., assignor.)						
Boisvert, Napoléon, assignor of three-fourths to J. and H. E. Hamilton, Salmon Falls, and E. M. Ball, Great Falls, N. H. Shuttle-check for looms	405,980	June 25	2427	635	47	1718
Boland, Claude M., New York, N. Y. Glove-sewing machine	400,432	Apr. 2	12	4	47	5
Bolen, Arthur O., *et al.* (See Kaylor, John, assignor.)						
Bolick, Jerome, Conover, N. C. Wheel	403,908	May 28	2045	538	47	1078
Boman, Clara W., New York, N. Y. Cigar wrapping and rolling machine	405,073	June 11	1025	274	47	1436
Bomm, Theodor, Mühlhausen, Germany. Transmission apparatus	403,637	May 21	1640	434, 435	47	991
Bonehill, Christopher G., Belmont Row, Birmingham, county of Warwick, England. Breech-loading fire-arm	404,380	June 4	13	3	47	1227
Boni, Frank H., Sioux City, Iowa. Road-cart	405,074	June 11	1026	274	47	1436
Bonine, Walter B. (See Beeson and Bonine.)						
Bonnell, Elliott M., and J. S. Lambing, Corry, Pa. Bed-spring	405,821	June 25	2173	571, 572	47	1673
Bonsall, Arthur C. (See Cowburn and Tentschert, assignors.)						
Book Metal Company. (See Schonacker, John E., assignor.)						
Bookwalter, John W., Springfield, Ohio. Apparatus for converting crude iron into malleable iron or steel	404,159	May 28	2430	636, 637	47	1155
Bookwalter, John W., Springfield, Ohio. Apparatus for converting crude metal into malleable iron or steel	405,766	June 25	2104	551	47	1659
Boorman, Joseph A., Leeds, county of York, England. Apparatus for plotting angles for bevel-gear	400,737	Apr. 2	451	120, 121	47	89
Booth, Ebenezer H., Kirkwood, N. Y. Vehicle-spring	402,894	May 7	501	133	47	757
Booth, George T., Christchurch, New Zealand. Disk harrow	405,005	June 11	924	244, 245	47	1414
Booth, James A., Boston, Mass. Machine for soldering end pieces on cans	405,822	June 25	2174	572	47	1673
Borden, Hamilton, *et al.* (See Selleck, William J., assignor.)						
Borgfeldt, Nicholas H., Brooklyn, and A. Lewyn, assignors to National Progress Bunching Machine Company, New York, N. Y. Cigar-bunching machine	403,410	May 14	1314	343	47	919
Borie, Louis J., assignor of one-half to G. F. Chevalier, San Francisco, Cal. Machine for affixing postage-stamps, &c	405,393	June 18	1500	398	47	1536
Borland, Lewis, San Francisco, Cal. Grain-drier	403,411	May 14	1315	344	47	919
Borland, Lewis, San Francisco, Cal. Grain-drier	403,412	May 14	1316	344	47	919
Born, Paul, New York, N. Y. Boiler-feed regulator	405,456	June 18	1605	423	47	1537
Boston and Lockport Block Company. (See Ferrall, Thomas R., assignor.)						
Boston Feed Basket Company. (See Williams, John H., assignor.)						
Boston Rubber Shoe Company. (See Bickford, Erskine F., assignor.)						
Boswell, Arthur C. (See Owen, Boswell, and Carlock.)						
Boswell, George G. F., assignor of two-fifths to J. E. and J. F. Boswell, Indianapolis, Ind. Drive-chain	403,909	May 28	2047	538	47	1078
Boswell, James F., *et al.* (See Boswell, George G. F., assignor.)						
Boswell, Joseph E., *et al.* (See Boswell, George G. F., assignor.)						
Bosworth, Charles B. (See Meady and Bosworth.)						
Bosworth, Percy B., assignor of one-half to C. Baechtold, Brooklyn, N. Y. Automatic vending apparatus	402,800	May 7	373	98	47	733

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Bothwell, David, Hannibal, N. Y. Liquid-measure	405,075	June 11	1027	274	47	1436
Botkin, Abram, Wilmington, Del., assignor of one-tenth to C. Udelewitz, Washington, D.C. Convertible chair	404,767	June 4	569	146	47	1338
Bottom, Turner D., New York, N. Y. Filament for incandescent electric lamps	404,463	June 4	138	.....	47	1251
Bottome, Turner D., Newark, N. J., assignor to J. B. Tibbits, Hoosick, N. Y. Manufacture of incandescent-lamp filaments	401,120	Apr. 9	1039	.....	47	205
Bottome, Turner D., assignor to J. B. Tibbits, Hoosick, N. Y. Chloridizing gold ores	405,824	June 25	2177	573	47	1674
Boughn, Benjamin F., Randolph, Nebr., and W. Cashner, Pleasant Hill, assignors of one-third to L. Gates, Garden City, Mo. Lock-hinge	400,540	Apr. 2	165	43	47	35
Boulay, Charles, St. Pie, Quebec, Canada. Sulky-plow	400,433	Apr. 2	13	4	47	6
Bourne, William S., Alton, Iowa. Wagon-body raiser	404,464	June 4	140	33	47	1252
Bousfield, Edward T. (See Howard and Bousfield.)						
Bontell, William H., assignor to C. W. Kelsea, Antrim, N. H. Apple parer, corer, and slicer	405,825	June 25	2178	573, 574	47	1674
Bouton, John W. (See Stahl and Bouton.)						
Bouzard, Gustave, Paris, France. Covered corset-steel	404,252	May 28	2585	673	47	1182
Bové, Hubert. Philadelphia, Pa. Candle-guard	403,509	May 21	1464	384	47	956
Bovee, David W., Tama, Iowa. Hay-stacker	402,895	May 7	502	133	47	757
Bowden, Joseph B., Brooklyn, N. Y. Forming rings	400,541	Apr. 2	167	44	47	35
Bowdish, Frank C. (See Burk, Morris E., assignor.)						
Bower, Byron B., Bainbridge, Ga. Water-motor	403,731	May 21	1782	469	47	1018
Bowers, Marcus M., assignor to Roland Plow Works, Baltimore, Md. Plow	403,032	May 7	697	182	47	795
Bowles, Zachary T., Hillsborough, Tex. Bridle-bit	403,510	May 21	1465	384	47	956
Bowling, Enoch C., *et al.* (See Morgan, Benjamin B., assignor.)						
Bowman, Henry L. (See Bowman and Sharp.)						
Bowman, Ira W. and H. L., and S. Sharp, East Liverpool, Ohio. Hame-fastener	403,732	May 21	1783	469	47	1019
Bowman, James W., College Corner, Ohio. Hand garden-cultivator	403,413	May 14	1317	344	47	919
Bowman, John. (See Steiale, William M., assignor.)						
Bowman, John D. (See Dudley and Bowman.)						
Bowman, John D., Altoona, Pa. Pressure-regulator	402,392	Apr. 30	2969	776	47	605
Bowman, John D., Altoona, Pa. Blow-off device	405,942	June 18	1285	340	47	1492
Bowman, John D., Altoona, Pa. Pressure-regulator for gas-conduits	405,944	June 18	1286	341	47	1492
Box, William W., Crayford, county of Kent, assignor to E. Weidlich, Holloway, England. Umbrella-frame	401,536	Apr. 16	1677	442	47	338
Boyce, Thomas, New York, N. Y. Percolator	404,591	June 4	342	82	47	1290
Boyd, John, assignor of one-eighth to W. G. White, Baltimore, Md. Centrifugal machine for treating grain, &c	403,910	May 28	2047	539	47	1078
Boyd, Robert, *et al.* (See Culberson, John L., assignor.)						
Boyden, George A., assignor of one-half to C. B. Mann, Baltimore, Md. Fluid-pressure brake. (Reissue)	10,993	Apr. 2	698	187, 188	47	133
Boyden, George A., assignor to Boyden Power Brake Company, Baltimore, Md. Locomotive-driver brake	403,871	May 21	1984	521	47	1057
Boyden, George A., assignor to Boyden Power Brake Company, Baltimore, Md. Locomotive-driver brake	404,339	May 28	2721	706	47	1207
Boyden, George A., assignor to Boyden Power Brake Company, Baltimore, Md. Release-valve for air-brakes	404,768	June 4	573	147	47	1338
Boyden, George A., assignor to Boyden Power Brake Company, Baltimore, Md. Engineer's cock for air-brakes	405,197	June 11	1211	321, 322	47	1472
Boyden, George A., assignor to Boyden Power Brake Company, Baltimore, Md. Locomotive-valve for air-brakes	405,657	June 18	1939	510	47	1622
Boyden, George A., assignor to Boyden Power Brake Company, Baltimore, Md. Pressure-regulating valve	405,981	June 25	2429	635	47	1718
Boyden Power Brake Company. (See Boyden, George A., assignor.)						
Boyer, Bassler, Lebanon, Pa. Car-brake	400,542	Apr. 2	168	44	47	35
Boyer, Edward C., Dayton, Ohio. Disk harrow and cultivator	401,994	Apr. 23	2380	619	47	480
Boyer, Leon. (See Bianchi, Francis, assignor.)						
Boyle, Homer L., Grand Rapids, assignor of one-half to H. B. Peck, Allegan, Mich. Mail-bag	403,872	May 21	1986	521	47	1058
Boyle, Peter J., Boston, and G. S. Gates, Athol, Mass. Garment-supporter	401,121	Apr. 9	1040	278	47	205
Boynton, Edward S., assignor to Campbell Printing Press and Manufacturing Company, New York, N. Y. Valve for pneumatic pipes or tubes	401,680	Apr. 16	1909	497	47	380
Boynton, Edward S., assignor to Campbell Printing Press and Manufacturing Company, New York, N. Y. Wrench	404,769	June 4	575	147	47	1338
Boynton, Edward S., assignor to Campbell Printing Press and Manufacturing Company, New York, N. Y. Pipe-wrench	404,770	June 4	576	147	47	1338
Boynton, John W. (See Ostrom and Boynton.)						
Bozell, Stephen A. D., Atlanta, Ind. Gate	403,911	May 28	2050	539	47	1079
Brace, Everett A., Moberly, Mo. Scaffold-bracket	401,636	Apr. 16	1852	481	47	370
Bracher, Philip H., Wincanton, county of Somerset, England. Distilling apparatus	403,638	May 21	1641	435	47	991
Bradburn, Joseph A., Northwich, county of Chester, England. Manufacturing caustic soda	402,296	Apr. 30	2741	.....	47	559
Braddock, James S. (See Strickler and Braddock.)						
Bradford, Charles K., Lynnfield, assignor to W. F. Kakas, Boston, Mass. Fishing-reel	403,733	May 21	1784	469	47	1019
Bradley, Arthur C. (See Bradley, Stephen R. and A. C.)						
Bradley, Arthur C. and S. R., Brooklyn, N. Y. Apparatus for the manufacture of white lead	404,253	May 28	2587	674	47	1182
Bradley, Charles S., Yonkers, N. Y. Electric motor	404,465	June 4	141	33	47	1252
Bradley, Charles S., Yonkers, N. Y. Alternating-current electric motor	404,466	June 4	143	33, 34	47	1252
Bradley & Hubbard Manufacturing Company. (See Evarts, Charles A., assignor.)						
Bradley, Jeremiah W., Marshall, N. C. Expectorant	402,296	Apr. 30	2838	.....	47	577
Bradley, Patrick P., Harrisburg, Pa. Hydrant-casing	403,639	May 21	1642	435	47	992
Bradley, Stephen R. (See Bradley, Arthur C. and S. R.)						
Bradley, Stephen R. and A. C., Brooklyn, N. Y. Manufacturing oxides	404,254	May 28	2588	674	47	1182
Bradley, William W., assignor to J. C. Dueber, Newport, Ky. Engraving and chasing machine	402,135	Apr. 30	2612	676, 677	47	533
Bradley, William W., assignor to J. C. Dueber, Newport, Ky. Watch-case pendant	403,511	May 21	1466	384	47	956
Bradsby, William B., assignor of one-half to C. Stewart, Greenville, Ill. Thill-coupling	402,502	Apr. 30	3169	821	47	639
Bradt, Charles E., *et al.* (See Mandrill, George W., assignor.)						
Bradwell, Thomas, Chicago, Ill. Cable-railway mechanism	403,512	May 21	1467	385	47	956
Brady, Charles N. (See Semple and Brady.)						
Brady, Farley, Waxahachie, Tex. Machine for packing cotton	403,734	May 21	1785	470	47	1019
Braggins, Seth, Rochester, N. Y. Means for controlling the flow of oil to injector-burners for steam-boiler furnaces	402,896	May 7	503	133	47	757
Brain, Robert D., Springfield, Ohio. Preventing the fraudulent return of periodicals	402,136	Apr. 30	2616	677	47	533
Brainard, Adelbert M., Chicago, Ill. Bolt and nut	404,953	June 11	846	221	47	1309
Braithwaite, Charles H., Ardmore, Pa. Grass-receptacle for lawn-mowers	402,237	Apr. 30	2742	710	47	559

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Braithwaite, Davies. (See Buxton, Braithwaite, and Smith.)						
Brambel, Grant, Lake Park, Minn. Padlock	401,407	Apr 16	1483	393	47	302
Brandenburg, Isaac S., Peoria, Ill. Steam-cooker	404,255	May 28	2590	674	47	1182
Brandes, Henry H., Corydon, Ky. Combined anvil and vise	405,992	June 25	2430	636	47	1718
Brandon, George. (See Pfeil, Philip, assignor.)						
Brandon, Robert L., near Fort Adams, Miss. Feed-regulator for cotton-gins	405,245	June 18	1288	341	47	1492
Brandt, Henry, Brooklyn, N. Y. Coal and wood cabinet	403,456	May 14	1379	361	47	931
Brandtner, Carl, Reading, Pa. Washing-machine	401,000	Apr. 9	867	232	47	175
Braun, Carl W. (See Gusten and Braun.)						
Braun, Charles A., Chicago, Ill. Electrical bell-pull	405,525	June 18	1715	453	47	1580
Braun, William F., assignor, by mesne assignments, to Consolidated Coupling Company, New York, N. Y. Car-coupling	405,457	June 18	1606	423, 424	47	1557
Braune, Anton. (See Mehlhardt, Julius, assignor.)						
Brawn, Augustus, assignor of one-half to J. H. Douge, Pleasant Hill, Nebr. Animal-trap	405,006	June 11	925	245	47	1415
Bray, John D., Montreal, Quebec, Canada. Fountain-pen	405,458	June 18	1609	424	47	1558
Bray, John P., and O. S. Pierce, Pawtucket, R. I. Machine for dying yarn on the skein	402,649	May 7	139	34	47	690
Bray, Mellen, Newton, Mass. Rivet	402,650	May 7	141	35	47	690
Bray, Mellen, Newton, Mass. Manufacturing pronged rivets	402,651	May 7	142	35	47	691
Bray, Morris P., Ansonia, Conn., assignor of one-half to C. L. Olmstead, West Brookfield, and A. D. Nason, Springfield, Mass. Making button-hole stripe	401,995	Apr. 23	2382	619	47	490
Breadin, Anna M., Philadelphia, Pa. School-desk	400,738	Apr. 2	454	121	47	89
Breden, Adalmar. (See Siemang, Stefan, assignor.)						
Breed, Albert H. (See Currier, Herbert L., assignor.)						
Breed, James L., Syracuse, N. Y. Paving-block	402,897	May 7	505	133	47	758
Breeden, William M., Bennettsville, S. C. Stalk-cutter	404,256	May 28	2591	674	47	1183
Breese, William. (See Race, George, assignor.)						
Brelaz, George L. (See Pictet, Raoul P., assignor.)						
Breth, Robert L., New Washington, Pa. Car-coupling	403,640	May 21	1644	436	47	992
Bretney, Eugene, Indianapolis, Ind., assignor to Cockle Separator Manufacturing Company, Milwaukee, Wis. Dust-collector	405,869	June 25	2247	591	47	1687
Bronx, Joseph F., Vineland, assignor of one-half to W. H. Grosscup, Camden, N. J. Bicycle	404,771	June 4	576	148	47	1339
Brewer, Adolph F., San Francisco, Cal. Gage for grinding twist or flat drills	403,175	May 14	924	244	47	845
Brewer, William J., assignor of three-fifths to T. W. Rae, F. H. Reed, W. Thompson, and G. N. McKibbin, New York, N. Y. Conduit for cable or electric railways	405,767	June 25	2106	558	47	1660
Brewington, Henry S., Baltimore, Md. Household sifter	403,087	May 14	792	211	47	820
Brewington, Henry S., Baltimore, Md. Fly-fan	404,890	June 11	760	194	47	1381
Brewster & Company, J. B. (See Wood, Thomas H., assignor.) (Reissue.)						
Brewster, Lewis W., and R. Swift, Palmyra, Tenn. Car-coupling	404,070	May 28	2300	602, 603	47	1128
Bride, Cotter T. (See Donnelly and Bride.)						
Bridgeport Brass Company. (See Somers, George E., assignor.)						
Bridgman, Edward H., Pittsfield, Mass. Adjustable box for shafts	401,408	Apr. 16	1484	393	47	303
Brierley, John H., Brooklyn, N. Y. Hair-plucking machine	400,794	Apr. 9	703	181	47	146
Briggs, John S., and W. E. Leach, San Buenaventura, Cal. Fruit-stoning machine	404,517	June 4	228	58	47	1267
Briggs, Joseph H. (See Kester, Jesse F., assignor.)						
Briggs, Lucina, Glasgo, Conn. Thread	400,739	Apr. 2	455	121	47	90
Brigham, Charles F., Boston, Mass. Steam-trap	401,772	Apr. 23	2048	530	47	418
Brillié, Lucien, Paris, France. Apparatus for registering the consumption of electric energy	403,244	May 14	1045	276, 277	47	869
Brinkerhoff, Warren M. (See Stevens, Brinkerhoff, and Swart.)						
Brinkerhoff, Warren M., Auburn, N. Y. Harrow	405,459	June 18	1610	424	47	1558
Brinkerhoff, Warren M., Auburn, N. Y. Cultivator	405,942	June 25	2360	619	47	1706
Brinkmann, Henry, Philadelphia, Pa. Ratchet-drill	404,592	June 4	343	88	47	1290
Brissard, Henri A., Paris, France. Paper-ruling machine	402,057	Apr. 23	2179	647, 648, 649	47	499
Bristol Brass and Clock Company. (See Taplin, Alvin, assignor.)						
Brizzolari, Davis, Madisonville, Tex. Whitewash	401,122	Apr. 9	1041	.....	47	206
Broad, Alphonzo H. (See Robbins and Broad.)						
Broadbent, Eli W. (See Faulkner, Alfred, assignor.)						
Broadbooks, Peter, Batavia, N. Y. Metal-shears	405,526	June 18	1716	453, 454	47	1581
Broadwell, Henry, Blue Mound, Kans. Washing-machine	401,731	Apr. 23	1992	522	47	408
Broadwell, John B., Alpharetta, Ga. Corn-planter and fertilizer-distributer	400,740	Apr. 2	455	121	47	90
Brobst, Benjamin, Columbus, Ohio. Washing-machine	400,741	Apr. 2	457	122	47	90
Brock, Matthias, Boston, Mass., assignor to McKay & Copeland Lasting Machine Company, Portland, Me. Machine for making tack-strips	402,058	Apr. 23	2483	649	47	499
Brock, Matthias, Boston, Mass., assignor to McKay & Copeland Lasting Machine Company, Portland, Me. Machine for setting tack-strips	402,059	Apr. 23	2484	649	47	500
Brock, Matthias, Boston, Mass., assignor to McKay & Copeland Lasting Machine Company, Portland, Me. Machine for making tack-strips	402,060	Apr. 23	2486	649	47	500
Brock, Matthias, Boston, Mass., assignor to McKay & Copeland Lasting Machine Company, Portland, Me. Machine for making tack-strips	402,061	Apr. 23	2488	650	47	500
Brock, Matthias, Boston, Mass., assignor to McKay & Copeland Lasting Machine Company, Portland, Me. Machine for making tack-strips	402,062	Apr. 23	2491	650	47	501
Brockett, William E., Berlin, Wis. Stuffing-box	400,543	Apr. 2	169	44	47	36
Brodt, Tilden E., Brodtville, Wis. Swinging gate	400,631	Apr. 2	289	82	47	60
Brogan, Anthony D., J. Craig, Firhill, Glasgow, county of Lanark, Scotland, and J. French, St. Paul, Minn. Annealing-kiln	405,527	June 18	1719	454	47	1581
Brogden, George W. H., London, England. Coupling for pipes or tubes	401,996	Apr. 23	2383	620	47	491
Bromwell, Charles E., Helena, Ark. Hand-motor	401,637	Apr. 16	1852	482	47	370
Bromwell, William T., *et al.* (See Welch, Rosia W., assignor.)						
Bronson, Levi, assignor of one-half to Pitts Agricultural Works, Buffalo, N. Y. Thrashing-machine	402,801	May 7	375	98, 99	47	733
Brook, Joseph L., Simcoe, Ontario, Canada. Shuttle-motion for looms	400,742	Apr. 2	458	122	47	90
Brooke, William M., assignor of one-half to J. J. Ebert, New York, N. Y. Feed-bag	401,001	Apr. 9	868	233	47	175
Brooks, David, Jr., assignor to Electric Cable Construction and Maintenance Company, Philadelphia, Pa. Box for the distribution of electric wires	401,927	Apr. 23	2286	503	47	462
Brooks, James A. (See Parrish, Elmer A., assignor.)						
Brooks, James W., trustee. (See Gildden, Charles W., assignor.)						
Brooks, James W., trustee. (See Phelan, Merton D., assignor.)						
Brooks, James W., trustee. (See Winter, Henry W., assignor.)						
Brooks, James W., *et al.*, trustees. (See Goddu, Louis, assignor.)						
Brooks, John, Plainfield, N. J. Rotary printing-machine	403,513	May 21	1468	325, 326	47	956

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Brooks, John B., Birmingham, England. Velocipede-saddle	401,128	Apr. 9	1041	278	47	206
Brooks, S. O. (See McDonald, Peter E., assignor.)						
Broomell, Thomas W., assignor of one-half to F. C. Burton, Erie, Pa. Machine for cutting key-seats	404,679	June 4	457	115	47	1314
Brotherton, Willard L., *et al.* (See Pickett, Chancy J., assignor.)						
Broughton, Charles A., Conway, N. H. Machine for forming spool-blanks	401,997	Apr. 23	2384	620	47	491
Broughton, Milton, Syracuse, N. Y. Machine for mixing mineral compounds	402,393	Apr. 30	2992	776, 777	47	605
Brown, Aaron L., Chicago, Ill. Filing-receptacle	404,772	June 4	577	148	47	1339
Brown, Alexander E., Cleveland, Ohio. Drilling-tool	401,537	Apr. 16	1678	442	47	338
Brown, Alexander E., Cleveland, Ohio. Boring-tool	402,394	Apr. 30	2994	777	47	605
Brown, Alfred G., Egan, Dak. Ter. Draft-equalizer	403,873	May 21	1987	521	47	1058
Brown, Andrew H., New York, N. Y. Leak-detector for pipes	401,409	Apr. 16	1485	393	47	303
Brown, Arthur, *et al.* (See Adams, Samuel J., assignor.)						
Brown, Arthur, and P. C. Payette, Detroit, Mich. Ruler	404,593	June 4	343	88	47	1290
Brown, Carver C. (See Cullen and Brown.)						
Brown, Charles M., Chicago, Ill. Lamp-extinguisher	400,743	Apr. 2	459	122	47	90
Brown, Charles T., assignor to F. L. Brown, Chicago, Ill. Lock-hook	404,160	May 28	2430	637	47	1155
Brown, Charles T., assignor to F. L. Brown, Chicago, Ill. Lock-hook	404,161	May 28	2433	637	47	1155
Brown, Charles W., assignor to Bell Telephone Company of Canada, Montreal, Quebec, Canada. Telephone-support	404,680	June 4	459	115	47	1314
Brown & Co., Reuben H. (See Smith, Thomas C., assignor.)						
Brown, Edward E. (See Alvord and Brown.)						
Brown, Flora L. (See Brown, Charles T., assignor.)						
Brown, Frank. (See Day, Milton, assignor.)						
Brown, Frank A., Angelica, N. Y. Bag-holder	403,641	May 21	1644	436	47	992
Brown, Fred. H., Fort Worth, Tex., assignor to Magneto Telegraph Company, of New York. Induction-coil	404,822	June 11	659	170	47	1364
Brown, Gay W., Los Angeles, Cal. Railway and railway-vehicle	400,544	Apr. 2	170	44, 45	47	36
Brown, George H., St. Louis, Mo. Apparatus for the manufacture of gas	402,395	Apr. 30	2997	777	47	606
Brown, George J. (See McCusker, Bernard, assignor.)						
Brown, George S., Atlanta, Ga. Appliance for sick-beds	404,681	June 4	460	115	47	1314
Brown, Horace S., Quincy, Ill. Dredging-machine	404,891	June 11	762	194, 195	47	1381
Brown, Israel F., New London, Conn. Brush-cylinder for cotton-gins	401,124	Apr. 9	1043	278	47	206
Brown, Jacob, *et al.* (See Adams, Samuel J., assignor.)						
Brown, James, deceased; K. Brown, Chicago, Ill., administratrix, and assignor to herself. Can-soldering machine	401,125	Apr. 9	1043	279	47	206
Brown, Jay W. (See Tubbs, Henry C., assignor.)						
Brown, John C. (See Meeks and Brown.)						
Brown, John P. (See Ritter, John L., assignor.)						
Brown, John W., Rock Falls, Ill. Road-cart	405,926	June 25	2180	578	47	1675
Brown, Justus H., Pittsburg, Pa. Overalls, &c	403,457	May 14	1361	362	47	931
Brown, Katie, administratrix. (See Brown, James.)						
Brown, Oscar J., Black River Falls, Wis. Flexible power-shaft	401,681	Apr. 16	1910	497	47	380
Brown, Philip C., Brooklyn, N. Y. Combined sink shovel and cleaner	401,126	Apr. 9	1043	279	47	207
Brown, Randolph H., Coleman, Ga. Mole-trap	403,912	May 28	2051	539	47	1079
Brown, Robert, assignor to Hoover & Gamble, Miamisburg, Ohio. Harvester-frame	401,127	Apr. 9	1049	280	47	207
Brown, Samuel, Seaford Hundred, Del., assignor to C. G. Emery, Brooklyn, N. Y. Machine for making cigarette mouth-pieces	403,324	May 14	1175	312, 313	47	894
Brown, Seth A., Buffalo, N. Y. Net-cutting attachment for torpedoes	401,773	Apr. 23	2049	536	47	418
Brown & Sharpe Manufacturing Company. (See Gay, Francis J., assignor.)						
Brown & Sharpe Manufacturing Company. (See Waterman, John S., assignor.)						
Brown, Walter B., Bordentown, N. J. Necktie-fastener	403,913	May 28	2052	540	47	1079
Brown, Walter F., Providence, R. I. Cut-off-valve gear	402,557	May 7	5	2, 3	47	664
Brown, Walter F., Providence, R. I. Steam-engine cylinder	403,642	May 21	1645	436	47	992
Brown, Walter F., Providence, R. I. Dash-pot	403,643	May 21	1647	437	47	992
Brown, Walter F., Providence, R. I. Steam-jacketed receiver	403,644	May 21	1648	437	47	993
Brown, Walter M., Albany, N. Y. Blow-pipe	405,528	June 18	1721	454, 455	47	1582
Brown, William M., Ingram Station, Pa. Awning-clevis	400,895	Apr. 9	705	191	47	146
Brown, William M., Johnstown, Pa., assignor to Johnson Steel Street Rail Company, of Kentucky. Cast-metal brace-chair for girder-rails	401,538	Apr. 16	1681	442	47	339
Brown, William M., Jr., Sacramento, Cal. Apparatus for operating safety-gates of railway-cars	403,176	May 14	925	244, 245	47	846
Browne, Aldis D. (See Evans, French S., assignor.)						
Browne, Arthur W. (See Casey and Browne.)						
Brownhill, Rowland W., Aston New Town, Birmingham, county of Warwick, England. Apparatus for vending gas	405,943	June 25	2363	619, 620	47	1706
Brownhill, Rowland W., Aston New Town, Birmingham, county of Warwick, England. Apparatus for vending gas	405,944	June 25	2368	621	47	1707
Brownhill, Rowland W., Birmingham, county of Warwick, England. Apparatus for vending gas	405,963	June 25	2431	636, 637	47	1718
Bruce, William, Wellsville, N. Y. Fire-escape	405,945	June 25	2372	622	47	1708
Brücker, Ewald, Sieglar, near Troisdorf, Germany. Sewing-machine	400,744	Apr. 2	461	123	47	91
Bruner, Preston M., St. Louis, Mo. Concrete pavement and floor	401,539	Apr. 16	1681	.....	47	339
Brunker, James E., and P. W. Maxwell, Dublin, Ireland. Inhaler	405,692	June 25	2009	534	47	1639
Brunne, Alfred O., Meriden, Conn. Lamp	404,162	May 28	2435	638	47	1156
Brunner, Marie, Brooklyn, N. Y. Skirt-belt	404,163	May 28	2437	638	47	1156
Brush Electric Company. (See Pfannkuche, Gustav, assignor.)						
Brust, Caspar, Schlossgasse No. 6/2, Haidhausen, Munich, Germany. Electro-therapeutic spectacles	401,622	Apr. 16	1911	498	47	380
Bryan, Dempsey T., Rocky Mount, N. C. Trace-carrier	405,460	June 18	1611	424	47	1588
Bryan, Henry, Modesto, Cal. Header attachment for harvesters	404,954	June 11	849	221, 222	47	1309
Bryant, Andrew J., Winton Place, assignor of one-half to T. S. Spivey, Cincinnati, Ohio. Combination-tool	401,327	Apr. 16	1353	361	47	277
Bryant, Charles A., Wakefield, Mass. Button	405,529	June 18	1723	455	47	1582
Bryant, Edmund A., Ellicottsville, N. Y. Boot-drier	402,137	Apr. 30	2617	677	47	534
Bryant, James N., *et al.* (See Bryant, John C., assignor.)						
Bryant, John C., assignor of two-thirds to J. N. Bryant, Charity, and J. N. Sullivan, Flat Creek, Tenn. Car-coupling	401,726	Apr. 16	1981	519	47	395
Bryant, Solon (See Corning, William O., assignor.)						
Bryce, Alexander F. (See Bryce, Peter F. and A. F.)						
Bryce, Peter F. and A. F., Indianapolis, Ind. Bread-making machine	402,396	Apr. 30	2998	778, 779	47	606

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.

Bryson, Andrew, Jr. (See Pendleton, Bryson, Tiers, and Moss.)						
Bryson, Andrew, Jr. (See Pendleton, Tiers, Bryson, and Moss.)						
Bryson, Andrew, Jr. (See Tiers, Pendleton, and Bryson.)						
Buchanan, Bolt & Co. (See Flood, Joseph T., assignor.)						
Buchanan, Judson. (See Sanders and Buchanan.)						
Buchanan, Laughlin M., Elmira, Ill. Automatic grain-weighing machine	404,257	May 28	2592	675	47	1183
Buchanan, Robert J., Pittsburg, Pa. Sash-fastener	404,467	June 4	146	34	47	1252
Buck Company, D. A. A. (See Buck, Daniel A. A., assignor.)						
Buck, Daniel A. A., assignor to D. A. A. Buck Company, Cheshire, Conn. Spoon-holder	402,716	May 7	240	63	47	709
Buckeye Iron and Brass Works. (See Krutzsch, William, assignor.)						
Buckingham, Hiram, Hartford, Conn. Grinding and sharpening machinery	401,875	Apr. 23	2203	576	47	447
Buckley, Robert C., Peoria, Ill. Wheel-cultivator	403,414	May 14	1318	345	47	920
Buckman, Samuel Y., Philadelphia, Pa. Machine for bending sheet metal	404,164	May 28	2437	{638 639	47	1156
Budd, Charles P. (See Dubinski, Benjamin, assignor.)						
Budd, Joseph W., and G. D. Carroll, New York, N. Y.; said Budd assignor to E. Thistle, West Hoboken, N. J. Apparatus for burning petroleum	403,033	May 7	698	183	47	795
Budding, Joseph B. (See Lindsey, George W., assignor.)						
Buechner, Carl G. Webster, Dak. Ter. Plow	404,823	June 11	660	170	47	1364
Buell, Charles E., New Haven, Conn. Time-switch for secondary batteries	403,177	May 14	927	{245 246	47	846
Buell, Charles O., New Haven, Conn. Hook	401,683	Apr. 16	1912	498	47	381
Buettner, John H., Cincinnati, Ohio. Sash-fastener	403,645	May 21	1649	437	47	993
Buffum, Charles J., Boston, Mass. Pocket card-case	405,339	June 18	1424	375	47	1521
Buford, Marcellus A., Thompson's Station, Tenn. Rotary engine	401,816	Apr. 23	2124	{553 554	47	430
Bühler, Adolph, Reichenhall, Bavaria, Germany. Papeterie	404,594	June 4	344	83	47	1290
Bühler, Otto. (See Müller, Carl A., assignor.)						
Buice, Luther G., Little Rock, Ark. Mold for casting window-weights	402,558	May 7	8	3	47	664
Bull, Charles T., Bayonne, N. J. Fastener for glove-packages	405,076	June 11	1028	275	47	1436
Bull, James E., Tracy City, Tenn. Car-coupling	404,468	June 4	147	34	47	1253
Bullard, James H., Springfield, Mass. Hydrocarbon-burner	404,955	June 11	850	222	47	1400
Bullough, John. (See Tweedale, Edmund, assignor.)						
Bulow, Paul, Cain, Kans. Coffee-boiler	405,946	June 25	2374	622	47	1708
Bunce, William H., Jersey City, N. J., D. Slate and J. Rodda, Hartford, Conn., assignors to C. C. Woolworth and J. S. Graham, New York, N. Y. Machine for packaging postal-cards	404,773	June 4	579	{148 149 150	47	1339
Bunch, W. P., *et al.* (See Loveland, Philander C., assignor.)						
Bunker, William I., Chicago, Ill. Spring attachmen for rocking-chairs	401,684	Apr. 16	1913	498	47	381
Bunker, William I., Chicago, Ill. Rocking-chair attachment	402,802	May 7	377	99	47	733
Bunker, William I., Chicago, Ill. Rocking-chair attachment	405,330	June 18	1725	455	47	1582
Bunker, William I., Chicago, Ill. Rocking-chair attachment	403,325	May 14	1182	313	47	895
Bunker, William I., La Grange, Ill. Attachment for rocking-chairs	405,340	June 18	1425	375	47	1521
Bunker, William I., La Grange, Ill. Rocking-chair attachment	405,341	June 18	1426	375	47	1521
Bunker, William I., La Grange, Ill. Rocking-chair attachment	400,434	Apr. 2	14	3	47	6
Bunnell, Marcellus J., Taylor, Tex. Hillside-plow	403,034	May 7	700	183	47	795
Bunnell, Morton G., assignor to F. C. Austin, Chicago, Ill. Grading and ditching machine	403,035	May 7	701	{183 184	47	796
Bunnell, Morton G., assignor to F. C. Austin, Chicago, Ill. Grading and ditching machine	404,774	June 4	584	{150 151	47	1340
Bunnell, Morton G., assignor to F. C. Austin, Chicago, Ill. Road-scraping machine	402,297	Apr. 30	2839	736	47	577
Bunting, Thomas C., East Manch Chunk, Pa. Bottle-stopper cover	401,328	Apr. 16	1354	360	47	278
Burbank, Abner J., and E. L. Church, Harvard, Ill. Pulley-changing device	405,461	June 18	1611	425	47	1558
Burbank, Henry L., Jersey City, N. J., assignor to American Bell Telephone Company, Boston, Mass. Metallic telephone-circuit	402,898	May 7	506	134	47	758
Burdick, Charles L., Kansas City, Mo. Paint-distributer	404,956	June 11	852	222	47	1400
Burdon, Levi L., Providence, R. I. Finger-ring	405,693	June 25	2001	525	47	1639
Burford, John M., Winfield, Kans. Attachment for plows or cultivators	401,247	Apr. 9	1239	330	47	243
Burgess, Charles M., assignor to Russell & Erwin Manufacturing Company, New Britain, Conn. Manufacture of key-blanks	404,892	June 11	763	199	47	1382
Burgess, Charles M., assignor to Russell & Erwin Manufacturing Company, New Britain, Conn. Latch-case						
Burgess, Robert, *et al* (See Grinnell, Eugene S., assignor.)						
Burk, Morris E., assignor of two-fifths to F. C. Bowdish, Lowville, N. Y. Holdback for vehicles	403,036	May 7	703	184	47	796
Burke, Charles G., Richmond Hill, N. Y. Telegraph-instrument	402,717	May 7	241	63	47	709
Burke, Charles G., Richmond Hill, assignor to F. Wolffe, trustee, New York, N. Y. Telegraphy	405,984	June 25	2436	{637 638	47	1719
Burke, Charles G., Richmond Hill, assignor to F. Wolffe, trustee, New York, N. Y. Telegraph-instrument	405,985	June 25	2437	638	47	1719
Burke, Charles G., Richmond Hill, assignor to F. Wolffe, trustee, New York, N. Y. Telegraphic instrument	405,986	June 25	2439	638	47	1720
Burke, Charles G., Richmond Hill, assignor to F. Wolffe, trustee, New York, N. Y. Telegraphic instrument	405,987	June 25	2440	639	47	1720
Burke, Charles G., Richmond Hill, assignor to F. Wolffe, trustee, New York, N. Y. Telegraph-instrument	405,988	June 25	2443	639	47	1720
Burke, Charles G., Richmond Hill, assignor to F. Wolffe, trustee, New York, N. Y. Telegraphic instrument	405,989	June 25	2444	{639 640	47	1721
Burke, John, assignor of one-half to P. H. Gunckel, Minneapolis, Minn. Valve	402,228	Apr. 30	2743	711	47	559
Burke, Stephen E., Edon, Ohio. Furnace-grate for portable engines	400,224	Apr. 2	597	163	47	114
Burkellow, Thomas A., Washington, Pa. Oil-well bailer	400,696	Apr. 9	706	191	47	146
Burkhard, Thomas, Jr., Brooklyn, N. Y. Trap for exhaust-steam pipes	401,248	Apr. 9	1240	330	47	243
Burlingame, Charles E., Boston, Mass. Photographic camera	403,574	May 21	1554	410	47	974
Burnap, George S., Marietta, Ga. Bolting-cloth cleaner	403,068	May 14	793	211	47	c20
Burnes, Samuel A. (See Wright, Berton L., assignor.)						
Burnett, Charles N., assignor of one-half to H. G. Higinbotham, Clay Centre, Kans. Hose-coupling for railway-cars	402,718	May 7	242	64	47	709
Burnett, Elisha C., Wilkes, Va. Double-shovel plow	405,007	June 11	927	246	47	1415
Burnham & Duggan Railway Appliance Company. (See Duggan, John A., assignor.)						
Burnham, Edward G. (See Smith, Henry V., assignor.)						
Burnham, Walter W., Boston, Mass. Calk for running-shoes	402,138	Apr. 30	2618	678	47	534
Burnham, Zimri W., Grand Rapids, Mich. Turbine wheel	404,340	May 28	2723	706	47	1207
Burnley, William, North East, assignor of two-thirds to C. A. Hitchcock and S. A. Davenport, Erie, Pa. Combined telephone and telegraph system	402,298	Apr. 30	2840	{735 736	47	577

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Burns, Frank, assignor of one-half to E. W. Holt, Westfield, N. Y. Fruit-basket-cover fastening	401,002	Apr. 9	809	233	47	175
Burns, H. A., *et al.* (See Stiles, Frederick, assignor.)						
Burns, John, Rochester, N. Y., assignor of one-half to R. W. Fredericks, Lock Haven, Pa. Smoke and gas consuming furnace	403,874	May 21	1988	522	47	1058
Burns, John B, Indianapolis, Ind., assignor of one-half to E. D. Eames, Watertown, N. Y. Automatic brake-adjuster	402,503	Apr. 30	3170	821	47	639
Burns, Samuel A., Bridgeport, Conn. Brake-handle	401,003	Apr. 9	870	233	47	175
Burns, Walter E., Rising Sun, Md. Road-cart	403,514	May 21	1473	386	47	957
Burr, Ellis M., Champaign, Ill., assignor to J. W. Penfield & Son, Willoughby, Ohio. Brick or tile cutting machine	403,646	May 21	1651	437	47	993
Burr, Theodore B., Harlan, Iowa. End-gate for vehicles	404,071	May 28	2302	603	47	1128
Burrall, William D., *et al.* (See De Zeng, Henry L., assignor.)						
Burrell & Company, D. H. (See Hart, Frederick, assignor.)						
Burrell, George S., Kalamazoo, Mich., assignor to F. E. Marsh, Indianapolis, Ind. Carpet-protector	402,504	Apr. 30	3171	821	47	639
Burridge, Thomas H., deceased; T. J. Burridge administrator, St. Louis, Mo. Sheaf or pulley for cable railways	403,326	May 14	1183	314	47	895
Burridge, Thomas J., administrator. (See Burridge, Thomas H.)						
Burrowes, Albert, Hemlock, Ontario, Canada. Propeller for canal-boats, &c	404,072	May 28	2303	603	47	1128
Burry, John, assignor of two-thirds to J. E. Munson and A. Wirsching, New York, N. Y., Telegraph	404,165	May 28	2439	{639 640 641	47	1156
Burt, James H., and S. E. Holman, West Randolph, Vt. Extension window-screen	400,825	Apr. 2	599	163	47	114
Burt, Townsend W., Mineola, N. Y. Setting apparatus for signals and gates	402,299	Apr. 30	2845	{736 737	47	578
Burtch, William C., and E. M. Gurnee, Kansas City, Mo. Nail-driver	404,166	May 28	2446	641	47	1157
Burtis, Edward F., Sacramento, Cal. Carriage-jack	404,167	May 28	2447	641	47	1158
Burton, Frank C. (See Broomell, Thomas W., assignor.)						
Burton, George D., Boston, Mass. Feed-trough	401,249	Apr. 9	1241	330	47	243
Burton, John M., and C. C. Crewson, Wichita, Kans. Stock-car	405,870	June 25	2248	591	47	1687
Burton, William, Lake Village, Ind. Ditching-plow	401,998	Apr. 23	2386	621	47	481
Buschmann, Friedrich, assignor to Salzwerk Heilbronn, Heilbronn, Germany. Rock-drill	402,229	Apr. 30	2744	711	47	559
Busenbarrick, James E., Robinson, Kans. Grain-weighing apparatus	405,462	June 18	1615	425	47	1559
Busiel, Charles A., *et al.* (See Busiel, Frank. E., assignor.)						
Busiel, Frank. E., assignor of two-thirds to J. T. and C. A. Busiel, Laconia, N. H. Sinker-bar for straight-knitting machines	403,985	May 28	2150	561	47	1098
Busiel, John T., *et al.* (See Busiel. Frank. E., assignor.)						
Busse, Leopold, San Francisco, Cal. Dumping-wagon	404,957	June 11	854	223	47	1400
Butler, James C., assignor of one-half to E. Best, Quincy, Ill. Smoke-consumer	404,775	June 4	587	151	47	1341
Butler, Nathan C., and F. D. Rosenberger, Leipsic, Ohio. Automatic heat-regulating device	400,826	Apr. 2	600	163	47	114
Butler, William H. (See Smith and Gill, assignors.)						
Butterick, Ebenezer, Brooklyn, N. Y. Hen's nest	404,073	May 28	2304	603	47	1129

Cheney, Cleveland J., Lowell, Mass. Water-gate	405,079	June 11	1030	275 / 276	47	1437
Cherry, Robert N., Jersey City, N. J. Door-check	402,804	May 7	379	100	47	734
Chesebrough, Robert A. (See Willcox, Oliver, assignor.)						
Chesley, William T., Viola, Ill. Combined nut and pipe wrench	405,343	June 18	1433	378	47	1522
Chevalier, George F. (See Borie, Louis J., assignor.)						
Chicago Gas Stove Company. (See Reed, Philip H., assignor.)						
Chicago Safe and Lock Company. (See Gross, Henry, assignor.)						
Chicago Sash Pulley Company. (See Phillips, Francis V., assignor.)						
Chiddister, Clark, Decatur, Ind. Gate	401,008	Apr. 9	876	225	47	177
Child, Brainard W. (See Wemple, George W., assignor.)						
Childs, Heman W. (See Denehy and Childs.)						
Childs, William A., Englewood, N. J. Galvanic battery	405,246	June 18	1290	361	47	1493
Chisholm, William. (See Dow, Joseph H. and H. H., assignors.)						
Choice, John B., *et al.* (See Anderson, Henry C., assignor.)						
Chorlton, Isaac, and G. L. Scott, Manchester, county of Lancaster, England. Bed-frame and bedstead	402,903	May 7	511	135	47	759
Chouteau, Pierre. (See Barth, Gustav A., assignor.)						
Chrisman, Joseph C., assignor of two-thirds to B. H. Myles and W. H. Taylor, Sewell Depot, W. Va. Car-pusher	405,012	June 11	935	248	47	1417
Christopher, John M., Clifton, Md. Track-clearer	402,405	Apr. 30	3011	792	47	608
Christy, James, Jr. (See Christy, Will, assignor.)						
Christy, James A., Los Angeles, assignor to J. W. Moyle, San Francisco, Cal. Advertising	405,532	June 18	1728	456	47	1582
Christy, Will, assignor of one-half to J. Christy, Jr., Akron, Ohio. Switch for electric-motor trolleys	402,064	Apr. 23	2494	651	47	501
Church, Bonneval E., London, assignor to J. Dewrance & Co., Lambeth, England. Treating asbestus	405,201	June 11	1220	.....	47	1472
Church, Charles E., assignor to Hancock Inspirator Company, Boston, Mass. Injector	405,990	June 25	2445	640	47	1721
Church, Charles E., assignor to Hancock Inspirator Company, Boston, Mass. Injector	405,991	June 25	2449	641	47	1722
Church, Charles E., assignor to Hancock Inspirator Company, Boston, Mass. Injector	405,992	June 25	2453	641	47	1722
Church, Eugene L. (See Burbank and Church.)						
Church, Frank S. (See Zerbe and Church.)						
Church, Frank S., Ovid, assignor to Union Store Service Company, East Saginaw, Mich. Adjustable curve for cash-carriers	404,896	June 11	771	197	47	1388
Church, Melvin B., Grand Rapids, Mich. Insecticide	401,998	Apr. 23	2267	.....	47	462
Church, Melvin B., Grand Rapids, Mich. Water-proof package	405,871	June 25	2252	592	47	1688
Churchill, Edwin. (See Barton, Edwin W., assignor.)						
Cincinnati Cooperage Company. (See Kane, Frank H., assignor.)						
Cissel, Robert B., Elizabeth, assignor to Backus Water Motor Company, Newark, N. J. Hanger for rotary fan-shafts	402,306	Apr. 30	2859	739	47	581
Claffy, John, *et al.* (See Greene, Patrick R., assignor.)						
Clapp Automatic Fire Extinguisher Company. (See Clapp, Joseph, assignor.)						
Clapp, Joseph, Evanston, assignor to Clapp Automatic Fire Extinguisher Company, Chicago, Ill. Automatic sprinkler	404,897	June 11	772	197	47	1384
Clarenbach, Eugen, Berlin, Germany. Disinfecting apparatus	400,437	Apr. 2	17	6, 7	47	6
Clark, Charles D., assignor to W. Deering & Company, Chicago, Ill. Nipper for spinning-machines	404,898	June 11	774	197	47	1384
Clark, Chester W., Mishawaka, Ind. Key for pulleys	402,065	Apr. 23	2495	651	47	501
Clark, Chester W., and T. D. Keasey, assignors to Keasey Pulley Company, Mishawaka, Ind. Pulley	403,987	May 28	2152	562	47	1098
Clark, Chester W., and T. D. Keasey, assignors to Keasey Pulley Company, Mishawaka, Ind. Bushing for pulleys	404,824	June 11	661	171	47	1364
Clark & Company, George M. (See Armour, Michael C., assignor.)						
Clark & Company, George M. (See Wallace, Jacob B., assignor.)						
Clark, Daniel T., Leslie, Mich. Wire-twisting machine	401,411	Apr. 16	1488	394	47	304
Clark, Dwight S., Cambridge, assignor to W. H. Forbes, Boston, Mass. Paper box	401,009	Apr. 9	877	225	47	177
Clark, Edward, New York, N. Y. Shaft-support	401,412	Apr. 16	1489	394	47	304
Clark, Edward D. and S. C., Evergreen, Tex. Hub for vehicle-wheels	405,872	June 25	2253	592	47	1688
Clark, Edward L., Pittsburg, Pa. Ingot-mold	404,381	June 4	14	4	47	1228
Clark, Edward L., Pittsburg, Pa. Casting steel ingots	404,382	June 4	15	4	47	1228
Clark, Edward L., Pittsburg, Pa. Bale-tie buckle	404,383	June 4	17	4	47	1228
Clark Electric Company. (See Clark, Ernest P., assignor.)						
Clark, Elias B. (See Finkle, John H., assignor.)						
Clark, Ernest P., assignor to Clark Electric Company, New York, N. Y. Regulator for dynamo-electric machines	404,602	June 4	356	85	47	1292
Clark, Frank M., Tilton, N. H., and F. R. Low, Chelsea, Mass. Power-meter	401,929	Apr. 23	2288	568 / 569	47	462
Clark, George D., Plainville, Conn. Caster	400,899	Apr. 9	710	192	47	147
Clark, George J. (See Arenberg, Herman, assignor.)						
Clark, James M., Louisville, Ky. Measuring-siphon	401,413	Apr. 16	1490	395	47	304
Clark, James T., deceased, Milwaukee, Wis.; M. F. Clark administratrix. Railway splice-bar	403,251	May 14	1057	278	47	871
Clark, John J., New York, N. Y. Spindle for winding yarn or thread on cards	405,077	June 11	1029	275	47	1436
Clark, John W., assignor of one-half to L. H. Kirkland, Jackson, Miss. Harness-saddle	401,124	Apr. 9	1060	284	47	909
Clark, Joseph E. (See Taft, Stephen C., assignor.)						
Clark, Leander R., Albia, Iowa. Automatic brake for vehicles	404,075	May 28	2306	604	47	1129
Clark, Mary F., administratrix. (See Clark, James T.)						
Clark, Morgan S., Toronto, Kans. Combined shears, button-hole cutter, and ripper	404,169	May 28	2450	642	47	1158
Clark, Nathan B., Washington, D. C., and F. B. King, Baltimore, Md. Steam-boiler	404,825	June 11	662	171	47	1364
Clark, Nathan B., U. S. Navy, and F. B. King, Baltimore, Md. Steam-boiler	405,344	June 18	1434	378	47	1522
Clark, Norman, assignor to J. H. and E. F. Lawrence, Sterling, Ill. Roller for sliding doors	405,202	June 11	1221	323	47	1473
Clark, Simmon C. (See Clark, Edward and S. C.)						
Clark, T. Emory, Brookline, Mass. Rotary brush	403,328	May 14	1185	314	47	896
Clark, Walton, assignor to United Gas Improvement Company, Philadelphia, Pa. Apparatus for manufacturing gas	404,520	June 4	237	56, 57	47	1209
Clark, William S., Philadelphia, Pa. Testing and disinfecting drain and soil pipes	404,343	May 28	2726	707 / 708	47	1208
Clarke, Charles M., *et al.* (See Gearing, Charles M., assignor.)						
Clarke, Samuel, Childs Hill, county of Middlesex, England. Lamp holder or frame	403,327	May 14	1184	314	47	895
Clarson, Augustus E., *et al.* (See Slaysman, Alexander, assignor.)						
Clason, Roger W., *et al.* (See Reams, John V., assignor.)						
Claussen, Edward E. (See Kimmel and Claussen.)						
Claussen, Edward E., Hartford, Conn. Paper bag	401,687	Apr. 16	1918	499 / 500	47	382
Clay, Henry P. (See Hartman and Clay.)						
Clayton, Herbert F. (See Cooper, Clayton, and Holdroyd.)						
Clayton, John, Fridley, Minn. Plow	403,329	May 14	1186	315	47	896
Clayton, Reginald B. B., London, England. Fork-guard	404,777	June 4	589	152	47	1341
Clayton, William H., and C. A. Loring, Atlanta, Ga. Sewing-machine motor	402,805	May 7	380	100	47	734
Clemens, Charles C., *et al.* (See Anderson, Henry C., assignor.)						
Clemens, Henry E. (See Hays and Clemens.)						
Clementa, Samuel A. (See Walter, William, assignor.)						
Clemes, William H., assignor to Taylor & Boggis Foundry Company, Cleveland, Ohio. Wick-raising shaft	405,078	June 11	1029	275	47	1436
Clemons, George F., Springfield, Mass. Differential hoisting mechanism	404,958	June 11	856	223 / 224	47	1401
Cleveland, Moses L., Delhi, N. Y. Road-cart	401,735	Apr. 23	1997	523	47	408
Cleveland Motor Company. (See Dahl, Olof, assignor.)						
Cleveland, Ralph D., and C. A. Hoffman, Minneapolis, Minn. Shutter for photographic cameras	402,806	May 7	381	100	47	734
Clevenger, Harison E. (See Conwell, William, assignor.)						
Clever, Henry H., Cleversburg, Pa. Lifting-jack	402,141	Apr. 30	2021	678	47	534
Clickener, Garret V. (See Van Nest, George, assignor.)						
Cliff, Edward, Nyack, N. Y. Vehicle-spring	401,135	Apr. 9	1061	284	47	909
Clifford, Elizabeth, Boston, Mass. Drying-frame for coated candles	402,406	Apr. 30	3012	792	47	609
Clinch, Charles, Leeds, county of York, England. Apparatus for brewing	403,252	May 14	1058	278	47	871
Clinton Wire Cloth Company. (See Scarles, Benjamin, assignor.)						
Close, Philipp C., Augusta, Ga. Mower	401,817	Apr. 23	2125	554 / 555	47	431
Clotworthy, William P., Baltimore, Md. Dessert-food compound	405,013	June 11	937	.....	47	1417
Cloyd, Henry C., Union City, Ind. Post-hole auger	401,999	Apr. 23	2387	621	47	481
Clute, Nicholas, Schenectady, N. Y. Feed-water heater and regulator	404,683	June 4	462	116 / 117	47	1315
Coats, Chandler C., Newark, N. J. Magnetic ore-separator	401,688	Apr. 16	1922	500	47	382
Coats, Charles E., Chicago, Ill. Tea-kettle	400,635	Apr. 2	295	83	47	61
Cockcroft, Thomas S., Liverpool, county of Lancaster, assignor to J. G. Chapman, Birkenhead, England. Measuring-vessel	404,603	June 4	358	86	47	1293
Cockfield, Joseph, and C. D. Higgins, Boone, Iowa. Rod-packing	400,438	Apr. 2	22	7	47	7
Cockle Separator Manufacturing Company. (See Bretney, Eugene, assignor.)						
Codde, Michael, Lake, assignor of one-half to L. G. Blossom, Chicago, Ill. Snap-hook	403,038	May 7	705	184	47	797
Coe, Frederick W., Vergennes, Vt. Ice-creeper	405,873	June 25	2254	592	47	1688
Coerper, Carl, assignor to Helios Actien-Gesellschaft für Elektrisches Licht und Telegraphenbau, Ehrenfeld, near Cologne-on-the-Rhine, Prussia, Germany. Dynamo-electric machine	402,066	Apr. 23	2496	652	47	501
Coffee, Henry M., Bunker Hill, Ill. Straw-stacker	402,707	May 7	383	101	47	735
Coffin, Charles L., Detroit, Mich. Electric welding	401,639	Apr. 16	1854	482	47	371
Coffin, Charles L., Detroit, Mich. Electric welding	405,345	June 18	1435	378	47	1523
Coffin, Ellery F., Muirkirk, Md. Car-coupling	402,808	May 7	387	102	47	736
Coffin, Harry N., Pittsburg, Pa. Car-brake	401,252	Apr. 9	1245	332	47	944
Coffin, John, assignor to Cambria Iron Company, Johnstown, Pa. Toughening forged articles of steel	401,010	Apr. 9	879	.....	47	177
Coggshall, H. F. (See Gates, Eugene N., assignor.)						
Cohn, Abram E., and G. A. Merrill, San Francisco, Cal. Sewer-trap	403,459	May 14	1383	369	47	932
Colborne, Benjamin. (See Perrin, William H., assignor.)						
Colby, Edward J., Chicago, Ill. Thread-protector	400,636	Apr. 2	296	83	47	62
Colby, Edward J., assignor to F. Siegel, J. S. Baer, and A. M. Rothschild, Chicago, Ill. Coin-controlled opera-glass case	405,659	June 18	1941	510	47	1522
Cole, Charles B., assignor to Cole Conduit Company, Detroit, Mich. Underground conduit for electrical conductors	403,925	May 21	1919	504	47	1046
Cole Conduit Company. (See Cole, Charles B., assignor.)						
Cole, Frederick W., assignor of one-half to M. G. Crane, Newton, Mass. Electro-magnet and armature	403,517	May 21	1480	388	47	958
Cole, Jonah R., New York, N. Y. Vehicle hub and axle	401,689	Apr. 16	1923	501	47	382
Cole, Louis, Chicago, Ill. Neckscarf	401,690	Apr. 16	1925	501	47	382
Cole, Sherman M., Anamosa, Iowa. Washing-machine	400,637	Apr. 2	297	83	47	62
Coleman Hardware Company. (See Holt, Daniel M., assignor.)						
Coleman Hardware Company. (See Zattau, Charles, assignor.)						
Coleman, John P., Swissvale, Pa. Electric signaling apparatus	402,562	May 7	19	6	47	666
Coleman, John P., Swissvale, Pa. Electrical signaling apparatus	404,170	May 28	2451	642 / 643	47	1158
Coleman, Vincent A., Port Hope, Ontario, Canada. Trace-buckle	405,247	June 18	1291	341	47	1403
Coles, David H. (See Coles, John L. and D. H.)						
Coles, John L. and D. H., Brooklyn, assignors to Empire State Manufacturing Company, New York, N. Y. Game apparatus	402,230	Apr. 30	2746	711	47	559
Coles, John L. and D. H., Brooklyn, assignors to Empire State Manufacturing Company, New York, N. Y. Sinker for fishing-lines	402,231	Apr. 30	2747	712	47	559
Colgate, Arthur E., New York, N. Y., assignor to Western Electric Company, Chicago, Ill. Treating underground electrical conduits with chemical substances	402,563	May 7	20	6	47	666
Colgate, Arthur E., New York, N. Y., assignor to Western Electric Company, Chicago, Ill. Protecting the lead pipe of telegraph-cables from corrosion	403,418	May 14	1322	346	47	920
Collé, Charles, assignor to H. Lahousse & Co., Lille, France. Galvanic battery	403,253	May 14	1059	279	47	871
Collett, Austin B., Chelsea, Mass., assignor to Collett Car Brake Company, Portland, Me. Brake-handle	402,142	Apr. 30	2023	679	47	535
Collett Car Brake Company. (See Collett, Austin B., assignor.)						
Colley, Frederick, Johnstown, Pa., assignor to Johnson Steel Street Rail Company, of Kentucky. Rolls for rolling three-flanged slot-rails	401,691	Apr. 16	1925	501	47	383
Colley, Frederick, Johnstown, Pa., assignor to Johnson Steel Street Rail Company, of Kentucky. Rolls for rolling bulb-webbed slot-rails	401,692	Apr. 16	1926	502	47	383
Colley, Frederick, Johnstown, Pa., assignor to Johnson Steel Street Rail Company, of Kentucky. Rolls for rolling Z-shaped slot-rails	401,693	Apr. 16	1927	502	47	383
Collier, Robert B., Columbus, Ohio. Sectional fly-wheel	402,564	May 7	21	6	47	667
Colling, Charles J., Cincinnati, Ohio. Handle-bar for bicycles	402,143	Apr. 30	2024	679	47	535
Collingwood, John G. (See Welles, Howard W., assignor.)						
Collins, Allen B., Burlington, Iowa. Air-brake signal	400,638	Apr. 2	298	84	47	62
Collins, Allen B., Burlington, Iowa. Air-brake signal	400,639	Apr. 2	300	84	47	62
Collins, Cyrus F. (See Robinson and Collins.)						
Collins, George, Detroit, Mich. Car-brake	403,090	May 14	797	212	47	921

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Collins, Horatio E., Detroit, Mich. Hammock-support	402,307	Apr. 30	2860	739	47	581
Collins, James I., Amsterdam, N. Y. Pipe-coupling	403,916	May 28	2054	540	47	1060
Collins, John, assignor of one-fourth to H. H. Lynch, San Francisco, Cal. Splicing cables	400,748	Apr. 2	464	125	47	91
Collins, Joseph, New Orleans, La. Back-band trace-carrier	402,399	Apr. 30	3004	780	47	607
Collins, Kate J., New York, N. Y. Celluloid or analogous binding	405,874	June 25	2255	592	47	1689
Collins, Matthias, Freeport, Pa. Double-acting swivel	400,749	Apr. 2	466	125	47	92
Collins, Wiley G., Shamrock, Va. Car-coupling	405,875	June 25	2256	593	47	1689
Collyer, Robert H., assignor to G. M. Harrison, New Orleans, La. Machine for delinting cotton-seed	402,232	Apr. 30	2748	712	47	560
Colman, Albert. (See Stone and Colman.)						
Colt's Patent Fire Arms Manufacturing Company. (See Ehbets, Carl J., assignor.)						
Colven, James M., New York, N. Y. Safety-valve	404,684	June 4	466	117	47	1316
Comerford, Michael M. (See Maxwell, James M., assignor.)						
Comey, Willard, Westborough, Mass. Boot or shoe sewing machine	400,439	Apr. 2	23	8	47	8
Comins, Irving E., Worcester, Mass. Device for holding cylinders while attaching card-clothing thereto	404,685	June 4	467	118	47	1316
Comstock, Asa M. (See Spruce and Comstock.)						
Conant, Albert F., Boston, Mass. Pocket memorandum-book	404,260	May 28	2595	{675 / 676}	47	1183
Conant, Hiram E., Stonington, Conn. Machine for spinning and winding silk	404,171	May 28	2456	643	47	1159
Condell, John, New York, N. Y. Last	405,346	June 18	1436	{379 / 380}	47	1523
Condict, George H., and V. Angerer, assignors to Electric Car Company of America, Philadelphia, Pa. Electric car	400,830	Apr. 2	605	165	47	115
Condict, Nathan W., Jr., Jersey City, N. J. Refrigerating apparatus	402,809	May 7	388	102	47	736
Condit, George M. (See Day, George C., assignor.)						
Conkle, H. C. (See Wilson, Stephen, Jr., assignor.)						
Conklin, Nathaniel A., Brooklyn, N. Y. Apparatus for elevating water	404,030	May 28	2223	583	47	1111
Conklin, Stephen W., Yonkers, N. Y. Clamp for clothes-lines, tent-ropes, &c	400,546	Apr. 2	172	45	47	36
Conkling, Gurdon, Glens Falls, N. Y. Magnetic separator	400,746	Apr. 2	462	{123 / 124}	47	91
Conkling, Gurdon, Glens Falls, N. Y. Magnetic separator	400,747	Apr. 2	463	124	47	91
Conkling, Gurdon, Glens Falls, N. Y. Treating magnetic iron ore	401,414	Apr. 16	1491	395	47	304
Conkling, Gurdon, Glens Falls, N. Y. Magnetic separator	401,415	Apr. 16	1492	395	47	304
Conkling, Gurdon, Glens Falls, N. Y. Magnetic separator	402,904	May 7	512	135	47	759
Conkling, Gurdon, Glens Falls, N. Y. Machine for separating iron from ores	403,575	May 21	1556	410	47	974
Conkling, Gurdon, Glens Falls, N. Y. Magnetic separator	403,576	May 21	1558	411	47	974
Conley, Michael R., Brooklyn, assignor to W. Bell, New York, N. Y. Apparatus for deoxidizing iron ores	404,344	May 28	2727	708	47	1208
Conn, Charles G., Elkhart, Ind. Cornet	402,721	May 7	240	65	47	710
Conn, Charles G., Elkhart, Ind. Musical wind-instrument	405,395	June 18	1504	399	47	1536
Conneely, Peter D., Horseheads, N. Y. Reduction-valve and pressure-regulator	405,533	June 18	1729	{456 / 457}	47	1583
Connell, John, Rochester, N. Y. Chip-breaker for planing-machines	405,014	June 11	937	249	47	1417
Conner, Joseph, assignor to J. Matthews, New York, N. Y. Soda-water apparatus	404,172	May 28	2458	643	47	1159
Connolly, Patrick, assignor to M. Dease, Brooklyn, N. Y. Tank for water-closets	401,640	Apr. 16	1855	{493 / 494}	47	371
Connor, Patrick H., Amesbury, Mass. Loom-picker	405,947	June 25	2376	622	47	1708
Conner, William. (See Lombard and Connor.)						
Conover, Edwin K. (See Fitzpatrick, Hugh F., assignor.)						
Conrad, Edwin S., *et al.* (See Conrad and Pounder, assignors.)						
Conrad, Isaac N., and A. W. Pounder, assignors of two-thirds to E. S. Conrad and M. Pounder, Elkhart, Ind. Mason's float	405,396	June 18	1505	399	47	1537
Conrader, Rudolph, Erie, Pa. Grinding-machine	404,686	June 4	460	118	47	1316
Conroy, James C., Pittsburg, Pa., assignor of one-half to Union Water Meter Company, Worcester, Mass. Liquid safety-valve for gas-distributing pipes	401,136	Apr. 9	1062	284	47	210
Considine, Thomas A., Chicago, Ill. Molding-machine	402,508	Apr. 30	3178	820	47	641
Consolidated Coupling Company. (See Braun, William F., assignor.)						
Consolidated Coupling Company. (See Michaelis, Otho E., assignor.)						
Constantine, George B. (See Foulon, Peter J., assignor.)						
Continental Motor and Electrical Company. (See Gartner, Alfred, assignor.)						
Continental Oxygen Company. (See Valon, William A. M., assignor.)						
Conwell, William, assignor of one-half to H. E. Clevenger, Neff, Ind. Hoof parer and trimmer	405,080	June 11	1031	276	47	1437
Cook, Albert E., assignor to G. W. Vancor, Knowlton, Quebec, Canada. Vehicle-spring	401,818	Apr. 23	2127	555	47	431
Cook, Frederick W., assignor of one-half to H. P. Gregory & Co., San Francisco, Cal. Tool for manipulating saw-teeth	402,400	Apr. 30	3005	780	47	607
Cook, George W., assignor of one-third to C. C. Canny, Detroit, Mich. Conduit for electric wires	402,565	May 7	22	6	47	667
Cook, Harlow W., Ottawa, Kans. Weather-strip	405,347	June 18	1437	380	47	1523
Cook, Jonas, Mount Pleasant, N. C. Transplanting-pot	402,722	May 7	246	65	47	710
Cook, M. C. (See Gillingham, Henry R., assignor.)						
Cook, Sidney, assignor of one-half to E. F. Sperry, Orlando, Fla. Wrench	401,819	Apr. 23	2128	555	47	431
Cook, William, New York, N. Y. Scale-measure	405,464	June 18	1617	426	47	1559
Cook, William, assignor of one-fourth to P. D. Reed, New York, N. Y. Last-block fastener	402,509	Apr. 30	3179	823	47	641
Cook, Winfield S. (See Westbrook and Cook.)						
Cooke, Charles S. (See Cooke, William A., Jr., and C. S.)						
Cooke, Edwin M., Brooklyn, assignor of one-half to N. C. Wooster, New York, N. Y. Rail-joint	402,308	Apr. 30	2861	739	47	581
Cooke, Edwin M., Brooklyn, assignor of one-half to N. C. Wooster, New York, N. Y. Rail-joint	402,402	Apr. 30	3007	781	47	607
Cooke, George A., Philadelphia, Pa. Photographing-instrument	401,330	Apr. 16	1335	362	47	278
Cooke, William A., Jr., Brooklyn, N. Y. Paper-filing index	402,401	Apr. 30	3006	780	47	607
Cooke, William A., Jr., and C. S., Brooklyn, N. Y. Transferring paper file and binder	403,826	May 21	1921	505	47	1046
Cooley, Charles A., Montreal, Quebec, Canada. Combined lamp shade or reflector and guard	401,416	Apr. 16	1493	396	47	305
Cooley, Charles H., assignor to Pratt & Whitney Company, Hartford, Conn. Valve-operating mechanism for grain-scales	402,510	Apr. 30	3179	823	47	641
Cooley, Charles H., assignor to Pratt & Whitney Company, Hartford, Conn. Automatic grain-scales	403,988	May 28	2154	{562 / 563 / 564}	47	1099
Coombe, John W., Sturgeon, Mo. Road-cart	405,081	June 11	1033	276	47	1437
Coombes, Joseph, Portland, Me., assignor to Coombes Mining and Dry Mineral Separator Company, Boston, Mass. Ore-separator	400,440	Apr. 2	24	8	47	8

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Coombes Mining and Dry Mineral Separator Company. (See Coombes, Joseph, assignor.)						
Coombs, Jesse, Greenfield, Mass. Cultivator	405,948	June 25	2376	623	47	1709
Coon, William S., Rochester, N. Y. Fire-escape	405,397	June 18	1505	{399 / 400}	47	1537
Cooper, Charles. (See Cooper, George, assignor.)						
Cooper, Charles W., Brooklyn, N. Y. Agitating hides or leather scraps	400,441	Apr. 2	25	9	47	9

Cooper, Charles W., Brooklyn, N. Y. Apparatus for treating hides or skins	400,443	Apr. 2	29	10	47	9
Cooper, Daniel C. (See Cady, Elisha W., assignor.)						
Cooper, George, assignor of one-half to C. Cooper, Bennington, Vt. Shirt-stretcher	403,737	May 21	1788	470	47	1020
Cooper, Robert, H. F. Clayton, and G. H. Holdroyd, Huddersfield, England. Filtering apparatus	401,930	Apr. 23	2291	594	47	463
Cooper, William, A. Milliken, and G. W. Bishop, assignors to Northwestern Tool and Implement Company, Minneapolis, Minn. Hinge-mortiser	403,518	May 21	1482	368	47	950
Cooper, William H., assignor of one-half to C. A. Fox, San José, Cal. Lubricator	402,404	Apr. 30	3009	781	47	608
Copeland, Lucius D., Camden, N. J. Casing for marine engines	402,403	Apr. 30	3008	781	47	608
Copelin, Elizabeth G., Washington, D. C. Pot lid or cover	405,949	June 25	2378	623	47	1709
Copper, Aaron F., Rochester, N. Y. Combined hoe and scraper	403,330	May 14	1167	315	47	896
Copperthite, Henry. (See Smith, Thomas S., assignor.)						
Corbett, Joseph, New York, assignor, by mesne assignments, to C. H. Otis, Brooklyn, N. Y. Snow-plow	404,173	May 28	2459	644	47	1160
Corbin Cabinet Lock Company. (See Doremus, Willard D., assignor.)						
Corcoran, Andrew J., Jersey City, N. J. Windmill	404,604	June 4	359	86, 87	47	1293
Corcoran, Daniel J., Dedham, assignor to L. M. A. Corcoran, Boston, Mass. Bottle-stopper	402,124	Apr. 23	2593	672	47	521
Corcoran, Lawrence M. A. (See Corcoran, Daniel J., assignor.)						
Corey, George D., assignor to H. W. Coburn, Lowell, Mass. Toy racket	404,899	June 11	777	196	47	1384
Corey, James N., Conneautville, Pa. Vehicle-seat lock	400,640	Apr. 2	302	85	47	63
Cornely, Emil and R., Paris, France. Embroidering and edging machine	405,146	June 11	1119	{297 / 298}	47	1453
Cornely, Emil and R., Paris, France. Embroidering-machine	405,147	June 11	1122	299	47	1454
Cornely, Robert. (See Cornely, Emil and R.)						
Corning, Thomas J., San José, Cal. Baling-press	403,738	May 21	1790	471	47	1020
Corning, William O., Bridgeport, Conn., assignor of one-half to S. Bryant, Worcester, Mass. Corset-clasp	405,876	June 25	2257	593	47	1689
Cornish, John, Boston, Mass. Photograph-cabinet	403,647	May 21	1652	438	47	993
Cornish, Joseph B., *et al.* (See Reimer, Robert J., assignor.)						
Cornwall, John B., assignor to Barnard & Leas Manufacturing Company, Moline, Ill. Rotary bolt	404,345	May 28	2729	708	47	1209
Cornwall, John B., assignor to Barnard & Leas Manufacturing Company, Moline, Ill. Sieve	405,660	June 18	1943	511	47	1623
Correll, Banner A. A. (See Correll, John F. and B. A. A.)						
Correll, John F. and B. A. A., York, Pa. Harrow	405,534	June 18	1730	457	47	1583
Corwin, Theodore L. (See Hilt, James W., assignor.)						
Coryell, Harlan B. (See Arnold, Don J., assignor.)						
Coryell, Miers, New York, N. Y. Compound steam-engine	400,641	Apr. 2	302	85	47	63
Cosh, William M., Baltimore, Md. Manufacturing gas	402,146	Apr. 30	2627	680	47	536
Coss, James C., Cleveland, Ohio. Carriage-bow	403,091	May 14	799	212	47	821
Costello, James J. (See Higgins, Daniel, assignor.)						
Costley, Emma. (See Daniels and Costley.)						
Cottingham, John C., *et al.* (See Naves, Benjamin H., assignor.)						
Coulas, James W., Clinton, Ill. Book-support	401,011	Apr. 9	880	{235 / 236}	47	177
Coup, John, New Haven, Conn. Car-coupling	401,775	Apr. 23	2051	537	47	418
Coup, John, New York, N. Y. Truck-beam for railway-cars	404,031	May 28	2224	563	47	1111
Coupland, Charles. (See Mitchell, John S., assignor.)						
Conrsen, George H., Baltimore, Md. Razor-strop	403,648	May 21	1653	438	47	994
Courtenay, William, New York, N. Y. Cogged gearing	404,296	June 11	664	172	47	1364
Couse, John T., Cochran, Ga. Coffee-roaster	403,419	May 14	1323	346	47	921
Cowburn, Thomas, Mödling, and F. Tentschert, Vienna, Austria-Hungary, assignors of one-half to A. C. Bonsall, Wyldewoods, England. Brake apparatus for railway-vehicles	401,694	Apr. 16	1927	{502 / 503 / 504}	47	383
Cowdery, Warren H., assignor of one-half to S. R. Harris, Ashtabula, Ohio. Making rakes	405,661	June 18	1944	511	47	1623
Cowell, Edward R. E., *et al.* (See Morgan, Benjamin B., assignor.)						
Cowles, George C., assignor of one-half to E. Germain, East Saginaw, Mich. Drive-pulley	403,460	May 14	1384	{362 / 363}	47	932
Cowley, James T., New York, N. Y., assignor to Lamson Consolidated Store Service Company, of New Jersey. Store-service apparatus	402,567	May 7	25	7	47	668
Cowley, James T., New York, N. Y., assignor to Lamson Consolidated Store Service Company, of New Jersey. Store-service apparatus	402,568	May 7	27	7, 8	47	668
Cowley, James T., New York, N. Y., assignor, by mesne assignments, to Lamson Consolidated Store Service Company, of New Jersey. Store-service apparatus	403,917	May 28	2055	541	47	1080
Cox, Charles A. and J. F., Louisville, Ky. Alarm system	400,750	Apr. 2	466	{125 / 126}	47	92
Cox, Charles W., and T. E. Van Dyke, Philadelphia, Pa. Electric lantern	401,417	Apr. 16	1494	396	47	305
Cox, George, La Delle, Dak. Ter. Harvester	404,261	May 28	2596	676	47	1183
Cox, Joseph F. (See Cox, Charles A. and J. F.)						
Cox, Michael D., Knoxville, assignor of one-half to J. R. McCallum, Knox County, Tenn. Car-coupling	403,461	May 14	1386	363	47	932
Coxe, Eckley B. (See Richards, Francis H., assignor.)						
Coxe, Eckley B. (See Salmon, Samuel, assignor.)						
Coxe, Eckley B., and S. Salmon, Drifton, Pa.; said Salmon assignor to said Coxe. Screening mechanism	403,989	May 28	2159	{564 / 565 / 566}	47	999
Coxe, Eckley B., and S. Salmon, Drifton, Pa.; said Salmon assignor to said Coxe. Screening mechanism	403,990	May 28	2161	{566 / 567}	47	1100
Coy, Adaline. (See Barton, Edward F., assignor.)						
Cozans, Luke F., *et al.* (See Balet, Joseph W., assignor.)						
Crabb, William, Percy, Iowa. Fence-post	403,991	May 28	2162	568	47	1100
Craddick, Ambrose M., and W. S. Heady, Tower Hill, Ill. Car-starter	405,535	June 18	1732	458	47	1583
Crafton, Charles B., assignor to O. S. King and W. Y. McLemore, Mason City, Ill. Beverage-mixer	400,547	Apr. 2	173	46	47	37
Crafts, Francis H., Buffalo, N. Y. Combined scroll and resawing machine	402,067	Apr. 23	2498	652	47	502
Crager, Samuel E., Wichita, Tex. Adjustable barrel-cover	402,144	Apr. 30	2625	679	47	535

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr's.	Official Gazette. Vol.	Official Gazette. Page.
Cragin, Patrick H., assignor to Seneca Screen Company, Penn Yan, N. Y. Paper-pulp screen	403,577	May 21	1559	411, 412	47	974
Craig, Isaac E., Camden, Ohio. Die for hammering sheet metal	403,918	May 28	2058	.....	47	1081
Craig, James. (See Brogan, Craig, and French.)

Culver, Edgar A., Cleveland, Ohio. Advertising-panel for delivery-wagons	400,831	Apr. 2	607	165	47	116
Culver, Ira, Cleveland, Ohio. Drill-gage	403,740	May 21	1793	471	47	1021
Culver, John P., Los Angeles, Cal. Asphalt-coated sheet-metal pipe	400,832	Apr. 2	608	166	47	116
Cumberland Manufacturing Company. (See Warren, John E., assignor.)						
Cumming, James, Buffalo, N. Y. Device for welding the ends of boiler-flues	403,520	May 21	1485	389	47	959
Cummings, George K., Philadelphia, Pa., assignor, by mesne assignments, to United States Gas and Fuel Company. Apparatus for the manufacture of gas	403,920	May 28	2060	542	47	1081
Cummings, George K., Philadelphia, Pa., assignor, by mesne assignments, to United States Gas and Fuel Company. Manufacturing gas	403,921	May 28	2062	542	47	1081
Cummings, John R., New York, N. Y., and G. E. Lloyd, Chicago, Ill. Stereotyper's sawing, trimming, and grooving machine	405,662	June 18	1945	511	47	1623
Cummings, Uriah, New Haven, Conn. Cement	402,511	Apr. 30	3180	.....	47	641
Cunningham, Daniel, Fall River, Mass. Take-up mechanism for looms	405,829	June 25	2183	575	47	1675
Cunningham, William F., assignor of one-half to E. Rutzler, Brooklyn, N. Y. Safety-valve	402,070	Apr. 23	2502	633	47	502
Cunningham, William F., assignor of one-half to E. Rutzler, Brooklyn, N. Y. Safety apparatus for steam-boilers	404,175	May 28	2463	645	47	1160
Cunnyngham, Victor L., Pittsburg, Pa. Station-indicator	404,384	June 4	18	5	47	1228
Curley, Mark, *et al.* (See Murray, John P., assignor.)						
Curlin Marine Velocipede Company, Seth. (See Curlin, Seth, assignor.)						
Curlin, Seth, assignor to S. Curlin Marine Velocipede Company, Union City, Tenn. Marine velocipede	401,736	Apr. 23	1998	523, 524	47	409
Curran, Benjamin F., Dunkirk, Ohio. Belt-lacing needle	405,536	June 18	1732	458	47	1583
Currie, Stanley C. C., Philadelphia, Pa., assignor to United Electric Improvement Company, Gloucester City, N. J. System of transmitting and distributing electricity	401,255	Apr. 9	1249	333	47	245
Currie, Stanley C. C., Philadelphia, Pa., assignor to United Electric Improvement Company, Gloucester City, N. J. Automatic cut-out for secondary batteries	401,332	Apr. 16	1359	363	47	279
Currier, Herbert L., Lynn, Mass. Device for indicating and recording the speed, &c., of railway-trains	404,032	May 28	2225	583, 584	47	1112
Currier, Herbert L., assignor to himself and A. H. Breed, Lynn, Mass. Push-button	404,033	May 28	2230	585	47	1112
Curry, Mary E. (See Levering and Curry.)						
Curtin Anti-Friction Roller Bearing Company. (See Curtin, John, assignor.)						
Curtin, Henry, Little Falls, N. Y. Stopping mechanism for knitting-machines	402,905	May 7	513	136	47	759
Curtin, Henry, Little Falls, N. Y. Circular-knitting machine	402,906	May 7	516	136	47	760
Curtin, John, assignor to Curtin Anti-Friction Roller Bearing Company, Denver, Colo. Journal-box	403,992	May 28	2163	568, 569	47	1100
Curtis, Charles H., Astor, Fla. Fruit-gatherer	405,017	June 11	945	252	47	1419
Curtis, Otis E. (See Barrett, Charles H., assignor.)						
Cushman, Henry D., Three Rivers, Mich. Apparatus for making menthol crystals	402,907	May 7	517	137	47	760
Cushman, Holbrook. (See Denison, Sylvester P., assignor.)						
Cuthbert, Charles R. (See Stoffel and Cuthbert.)						
Cutlan, Ellis, London, England. Tool for spiral turning	403,521	May 21	1486	390	47	960
D'Hinny, Paul R. D., Clapham Rise, county of Surrey, England. Globe or shade for lamps or lanterns	401,934	Apr. 23	2296	596	47	464
Daboll, Nathan D., New York, and J. L. Follett, Brooklyn, N. Y. Cuff-holder	405,877	June 25	2258	593	47	1689
Daelen, Reiner. (See Schumacher, Daelen, and Rothe.)						
Daft, Leo, Plainfield, N. J. Connector for electric railways	403,092	May 14	800	212	47	822
Daft, Leo, Plainfield, N. J. Voltmeter	404,470	June 4	150	35	47	1253
Daft, Leo, Plainfield, N. J. Electric railway	404,687	June 4	470	118	47	1317
Dagwell, Frank. (See Leroy and Dagwell.)						
Dahl, Olof, Brooklyn, N. Y. Electric meter	405,249	June 18	1294	342	47	1493
Dahl, Olof, Brooklyn, assignor to Cleveland Motor Company, New York, N. Y. Electric switch	405,248	June 18	1293	349	47	1493
Dahlstrom, Andrew, Ashton, Mich. Advertising or display device	400,549	Apr. 2	177	48	47	37
Dahlstrom, Andrew, Ashton, Mich. Self-waiting table	401,820	Apr. 23	2129	556, 557	47	432
Dailey, Charles E., East Liverpool, Ohio. Car-replacer	405,398	June 18	1507	400	47	1537
Dailey, Joseph A., Toledo, Ohio. Gas-burner for grates and stoves	402,655	May 7	148	36, 37	47	692
Daine, Richard, Halifax, Nova Scotia, Canada. Cutlery	404,395	June 4	20	5	47	1220
Dainty, Elijah, Coal Bluff, Pa. Gripper for cables	403,650	May 21	1656	439	47	994
Dake, Francis A. (See Quillian and Dake.)						
Dallas, Alexander, Bayonne, N. J. Truss	401,877	Apr. 23	2295	577	47	448
Dallas, Madison, New Orleans, La. Machine for making barrel-staves	405,148	June 11	1123	299	47	1454
Dallett, George A., *et al.* (See Billberg, Carl O. C., assignor.)						
Dallett, Thomas H., *et al.* (See Billberg, Carl O. C., assignor.)						
Dally, Charles A., and H. K. Richardson, Pittsburg, Pa. Automatic cut-off and gas-regulator	405,830	June 25	2184	575	47	1675
Daly, Michael J., assignor to W. C. Barr, Jr., Pittsburg, Pa. Elevator-hatchway	403,875	May 21	1989	522, 523	47	1059
Dalzell, Gilmore & Leighton Company. (See Leighton, George W., assignor.)						
Dana, Woodbury K. (See Watt, John, assignor.)						
Dangler Stove and Manufacturing Company. (See Ruppel, Henry, assignor.)						
Daniels, Samuel, assignor to J. M. Adams, Chicago, Ill. Vapor-stove	402,409	Apr. 30	3017	783	47	610
Daniels, Samuel, assignor to J. M. Adams, Chicago, Ill. Vapor-stove	404,961	June 11	866	226	47	1403
Daniels, William H., and E. Costley, St. Louis, assignors to C. D. Moody, Webster Grove, Mo. Car-axle lubricator	403,876	May 21	1991	523	47	1059
Dansinger, Robert, Albany, N. Y. Street-railway track	403,741	May 21	1794	472	47	1021
Danzenbaker, Francis, Claymont, Del. Bee-hive	402,002	Apr. 23	2392	632, 633	47	488
Darling, Robert F., Seneca Falls, N. Y. Turning-lathe	400,550	Apr. 2	180	49	47	38
Darnell, William N., Worthington, Ind. Shingle-machine	403,420	May 14	1324	346	47	921
Darragh, Albert C., Allegheny, Pa. Oil-filter	401,544	Apr. 16	1690	446	47	340
Darrow, Alexander H., Chicago, Ill. Billiard-cue-tip fastener	405,850	June 25	2378	623	47	1709
Dane, Herman, Woodland, Wis. Water-reservoir	404,386	June 4	20	5	47	1220
Davenport, Samuel A., *et al.* (See Burnley, William, assignor.)						
Davey, Henry, Westminster, county of Middlesex, England. Steam-boiler	404,176	May 28	2463	645	47	1161
Davidson, John, and J. Taylor, Guelph, Ontario, Canada. Safety-lamp	405,878	June 25	2259	593	47	1690
Davidson, Otis E., assignor to W. W. Martin, Nashville, Tenn. Seal-lock	400,445	Apr. 2	32	10	47	10
Davies, Charles G. (See Robilliard and Davies.)						
Davies, Thomas A., New York, N. Y. Railway-rail fish-plate	402,724	May 7	249	66	47	711
Davies, Thomas A., New York, N. Y. Railway fish-plate	402,725	May 7	250	66	47	711
Davies, Walter D., Brooklyn, N. Y., assignor to Ansonia Clock Company, Ansonia, Conn. Clock	400,753	Apr. 2	471	127	47	93
Davis, Albert T. L. (See Pepper and Davis.)						
Davis, Asa, and J. H. W. Marriott; said Davis assignor to W. H. Sadler, Baltimore, Md. Fraction-key for type-writing machines	403,179	May 14	983	247	47	847
Davis, Charles, assignor of two-thirds to C. Marder and C. W. Marlin, Kansas City, Mo. Grip-slot closer for cable railways	403,651	May 21	1657	439	47	994
Davis, Charles L. (See Hilderbrand, Rost, and Davis.)						
Davis, Chester B., and E. H. Riddell, Chicago, Ill. Water-filter	404,962	June 11	868	227	47	1403
Davis, Delamore L., Salem, Ohio. Electric meter for alternating currents	402,410	Apr. 30	3018	783	47	610
Davis, E. Page, *et al.* (See Serrocs, Courtney S., assignor.)						
Davis, Etna H., and R. Westervelt, Elmira, N. Y. Automatic sprinkler	402,569	May 7	30	8	47	689
Davis & Furber Machine Company. (See Wickers, George O., assignor.)						
Davis, G. R. (See McConnell, Robert B., assignor.)						
Davis, George H., Washington, D. C., assignor to A. D. Klaber, New York, N. Y. Duplicating apparatus	404,778	June 4	560	153	47	1341
Davis, George J., Mill Ray, assignor of one-half to W. D. Davis, Statesborough, Ga. Machine for sawing shingles	404,827	June 11	664	172	47	1365
Davis, George M., Chicago, Ill. Air-valve	404,963	June 11	872	227	47	1404
Davis, Isaac N., and G. Tweedy, West Elizabeth, Pa. Combined cooking-stove and grate	404,177	May 28	2464	645	47	1161
Davis, James L., Kimberton, Pa. Dray	404,688	June 4	471	119	47	1317

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr's.	Official Gazette. Vol.	Official Gazette. Page.
Davis, James M., assignor of one-half to S. Taylor, Hudnut, Ind. Table	404,689	June 4	473	119	47	1317
Davis, Jehiel M., Northampton, Mass. Railway-car	405,696	June 25	2004	500	47	1640
Davis, Jehu W., assignor of two-thirds to E. B. Foster and J. W. Leedy, Le Roy, Kans. Door-spring	403,922	May 28	2064	542	47	1081
Davis, John. (See Abrahams, John W., assignor.)						
Davis, John, Allegheny, Pa. Support for water-conductors	402,003	Apr. 23	2395	623	47	483
Davis, John, Allegheny, Pa. Filter	402,656	May 7	145	37, 38	47	692
Davis, John, Allegheny, Pa. Filter	402,657	May 7	151	38, 39	47	692
Davis, John, Allegheny, Pa. Filter	402,658	May 7	154	39, 40	47	693
Davis, John, Allegheny, Pa. Filter	402,659	May 7	159	40	47	694
Davis, John, Allegheny, Pa. Water-purifier	402,660	May 7	160	40	47	694
Davis, John, Allegheny, Pa. Filter	402,661	May 7	161	41	47	694
Davis, John, New Bedford, Mass. Machine for drilling rails for fish-bolts	402,310	Apr. 30	2866	742	47	582
Davis, John S., Cleveland, assignor to Davis Platform Binder Company, Rockport, Ohio. Band-securing mechanism for grain-binders	401,013	Apr. 9	882	{226 / 227}	47	178
Davis, John S., assignor to Davis Platform Binder Company, Cleveland, Ohio. Grain-binder	405,203	June 11	1222	303	47	1473
Davis, Julius M., Columbia, Tenn. Spring bed-bottom	400,900	Apr. 9	711	{192 / 193}	47	147
Davis, Milton G. (See Sturtevant and Davis.)						
Davis, Moses M. (See Yale, Charles O., assignor.)						
Davis, Orion L., Rochester, N. Y. Mechanism for operating the gates or doors of elevator-wells	402,411	Apr. 30	3020	784	47	610
Davis, Orion L., Rochester, N. Y. Elevator-gate	402,412	Apr. 30	3023	785	47	611
Davis, Percy L., San Francisco, Cal. Store-service apparatus	405,951	June 25	2379	624	47	1709
Davis Platform Binder Company. (See Davis, John S., assignor.)						
Davis, Robert, *et al.* (See Murray, John P., assignor.)						
Davis, Stillman C., Cambridge, Mass. Blackboard-eraser	402,570	May 7	31	8	47	669
Davis, William D. (See Davis, George J., assignor.)						
Davis, Zebulon, Cleveland, Ohio. Vapor-stove	405,149	June 11	1125	299	47	1454
Davy, John W., Kingston, Ontario, Canada. Pole or tower	401,333	Apr. 16	1361	363	47	280
Dawes, Edward L., and W. A. Myler, New Brighton, Pa. Cooking-vessel	403,093	May 14	801	213	47	822
Dawson, William. (See Williams, Frost, and Dawson.)						
Day, George C., assignor of one-half to G. M. Condit, Nineveh, Pa. Alarm-lock	402,413	Apr. 30	3023	785	47	611
Day, Jeremiah E., assignor of one-half to J. Pracy, San Francisco, Cal. Well boring or drilling apparatus	403,877	May 21	1992	523	47	1059
Day, Milton, Berrett, assignor of one-half to F. Brown, Baltimore, Md. Cultivating-plow	403,463	May 14	1387	364	47	933
Day, Moses H., Brookline, Mass. Reel for machines for forming and reeling ropes or strands	402,004	Apr. 23	2395	624	47	483
Day, Patrick L., assignor to American Wire Company, Cleveland, Ohio. Guide-box	404,178	May 28	2465	645	47	1161
De Beaumont, Henry B., Geneva, Switzerland. Map	400,642	Apr. 2	304	85	47	63
De Brouwer, Joseph, Bruges, Belgium. Gas-washer	404,606	June 4	363	87	47	1294
De Camp, William H., Grand Rapids, Mich. Fracture apparatus	401,933	Apr. 23	2295	596	47	464
De Caux, William, Philadelphia, Pa. Light-holder for hot-beds	401,137	Apr. 9	1064	285	47	210
De Ferranti, Sebastian Z., Hampstead, county of Middlesex, England. Electro locomotive-engine	402,311	Apr. 30	2867	742	47	582
De Figanière, Affonso, Philadelphia, Pa.; G. Peacock, committee of said De Figanière, lunatic. Insulating and coating compound	401,014	Apr. 9	885	.....	47	178
De Lamater, C. H. (See Rider, Thomas J., assignor.)						
De Lamater, William, *et al.* (See Rider, Thomas J., assigner.)						
De Mier, John R., Las Cruces, N. Mex. Ter. Electrical float-signaling apparatus	403,180	May 14	935	{247 / 248}	47	847
De Owens, Griff, Loyalton, Dak. Ter. Bag-holder	400,551	Apr. 2	183	49, 50	47	39
De Souchet, Augustus M., *et al.* (See Railsback, Lafayette D., assignor.)						
De Vol, Ambrose L., Binghamton, N. Y. Hammer	404,388	June 4	22	5	47	1229
De Witt, James M., Rutherford, N. J. Car-check	404,901	June 11	778	198	47	1385
De Witt, Martin V., Paris, Tex. Cultivator	405,204	June 11	1224	324	47	1473
De Zeng, Henry L., Geneva, assignor to himself, A. G. Lucas, Utica, and W. D. Burrall, Waterloo, N. Y. Metallic railway tie and fastening	400,643	Apr. 2	304	86	47	63
Dean, Emil M., Alta, Cal. Staple-driver	405,537	June 18	1733	{458 / 459}	47	1583
Dean, William R., Ottawa, Kans. Cash-carrier	405,538	June 18	1734	{458 / 459}	47	1584
Dear, Somerville. (See Lawson and Dear.)						
Dease, Martin. (See Connolly, Patrick, assignor.)						
Debontteville, Edouard D., and L. P. C. Malandin, Fontaine-le-Bourg, France. Motive-power engine	400,754	Apr. 2	473	{127 / 128}	47	93
Decatur Coffin Company. (See Olson, Christopher H., assignor.)						
Decker, Jacob P., assignor to E. & H. T. Anthony & Company, New York, N. Y. Photographic-plate-holding apparatus	402,512	Apr. 30	3181	824	47	641
Decker, Wilhelm, Mittweida, Saxony, Germany. Machine for converting wire into a continuous row of clamps	403,923	May 28	2065	543	47	1082
Decker, Wilhelm, Mittweida, Saxony, Germany. Machine for fastening card-clothing to flats	403,924	May 28	2067	543	47	1082
Deeds, John B., assignor to R. H. Catlin, Terre Haute, Ind. Asbestus packing	400,755	Apr. 2	475	.....	47	93
Deeds, John B., assignor to R. H. Catlin, Terre Haute, Ind. Treating asbestus	400,756	Apr. 2	475	.....	47	93
Deere & Company. (See Moore, Gilpin, assignor.)						
Deere, Mansur & Co. (See Tebbetts, Pope, and Stewart, assignors.)

Ecanbert, Frederic, Brooklyn, N. Y. Making ring-dies	404,522	June 4	242	57	47	1270
Ecker, William, Newark, N. J. Wind-wheel	401,139	Apr. 9	1666	263	47	210
Eckert, John C., assignor of one-half to Callender & Patterson, Dayton, Ohio. Bench-stop	405,401	June 18	1511	401	47	1538
Eddy, Albert. (See Lewis, Russell H., assignor.)						
Eddy, Charles F. A., Greenfield, Mass. Egg-carrier	401,645	Apr. 16	1867	485	47	372
Edens, George. (See Durham, John F., assignor.)						
Edgar, Ellis F., New York, N. Y. Burning carbonaceous material	402,422	Apr. 30	3049	788 / 789	47	616
Edgar, Ellis F., Woodbridge, N. J. Furnace	402,514	Apr. 30	3186	824 / 825	47	642
Edge, James S., and F. W. Ticehurst, Birmingham, county of Warwick, England. Automatic and instantaneous gas-lamp extinguisher	403,654	May 21	1660	440 / 441	47	995
Edge, William C., Newark, N. J. Belting for machinery	401,779	Apr. 23	2056	530	47	419
Edge, William C., Newark, N. J. Chain	401,935	Apr. 23	2297	594	47	464
Edison Electric Light Company. (See Edison, Thomas A., assignor.)						
Edison Phonograph Company. (See Edison, Thomas A., assignor.)						
Edison Phonograph Toy Manufacturing Company. (See Jacques, William W., assignor.)						
Edison, Thomas A. (See Entz, Justus B., assignor.)						
Edison, Thomas A., Llewellyn Park, N. J. Phonogram-blank	400,648	Apr. 2	314	[illegible]	47	65
Edison, Thomas A., Llewellyn Park, N. J. Making phonogram-blanks	400,649	Apr. 2	314	86	47	65
Edison, Thomas A., Llewellyn Park, N. J. Making phonogram-blanks	400,650	Apr. 2	315	86	47	65
Edison, Thomas A., Menlo Park, N. J. Electrical-distribution system	404,902	June 11	779	199	47	1385
Edison, Thomas A., Llewellyn Park, N. J., assignor to Edison Phonograph Company, of New Jersey. Phonograph recorder and reproducer	400,646	Apr. 2	311	87	47	64
Edison, Thomas A., Llewellyn Park, N. J., assignor to Edison Phonograph Company, of New Jersey. Phonograph	400,647	Apr. 2	312	88	47	65
Edison, Thomas A., Menlo Park, N. J., assignor to Edison Electric Light Company, New York, N. Y. System of electric lighting	401,486	Apr. 16	1597	422	47	324
Edison, Thomas A., Menlo Park, N. J., assignor to Edison Electric Light Company, New York, N. Y. Incandescing electric lamp	401,646	Apr. 16	1868	485	47	372
Edwards, E. R. (See Bartholomew, George E., assignor.)						
Edwards, Richard J., Galena, Ill. Pipe-coupling	400,759	Apr. 2	478	128	47	94
Edwards, Richard J., Galena, Ill. Car-coupling	405,085	June 11	1038	277	47	1438
Edwards, William J., Chicago, Ill. Colter attachment for plows	401,337	Apr. 16	1369	364 / 365	47	281
Ege, Alexander H. (See Richardson, John T., assignor.)						
Egler, Jacob D., Pittsburg, Pa. Spring-gun	403,096	May 14	804	214	47	822
Egleston, Thomas, New York, N. Y., assignor to Plume & Atwood Manufacturing Company, Waterbury, Conn. Electric conductor	401,936	Apr. 23	2298	597	47	464
Egner, Frederic. (See Harrison and Egner.)						
Egner, Frederic, and J. W. Harrison, St. Louis, Mo. Valve	404,392	June 4	27	6, 7	47	1230
Ehbets, Carl J., assignor to Colt's Patent Fire Arms Manufacturing Company, Hartford, Conn. Lock for fire-arms	402,423	Apr. 30	3051	789	47	617
Ehbets, Carl J., assignor to Colt's Patent Fire Arms Manufacturing Company, Hartford, Conn. Cartridge-feed pack for revolvers	402,424	Apr. 30	3053	789	47	617
Ehrlich, A. (See Sommerfeld, Heinrich, assignor.)						
Ehrlich, Leo. (See Tivy and Ehrlich.)						
Ehrlich, Leo, assignor to American Roll-Paper Company, St. Louis, Mo. Paper-cutter	405,402	June 18	1511	402	47	1538
Eichbaum, Henry, Mount Vernon, N. Y., assignor to W. S. Lamson, Lowell, Mass. Store-service apparatus	402,575	May 7	36	9	47	670
Eichbaum, Henry, Mount Vernon, N. Y., assignor to W. S. Lamson, Lowell, Mass. Store-service apparatus	402,576	May 7	39	10	47	671
Eilers, Bernerd, Jr., Rochester, N. Y. Wood-grinder for pulp-making	402,425	Apr. 30	3055	790	47	617
Eilers, Bernerd, Jr., Rochester, N. Y. Paper-pulp screen	402,426	Apr. 30	3058	790	47	618
Eisenhuth, John W., San Francisco, Cal. Hair-cutter	402,727	May 7	252	66, 67	47	711
Eishon, Catherine, *et al.* (See McCarty, William F. M., assignor.)						
Elcoate, Thomas, Norton, Stockton-on-Tees, county of Durham, England. Can-opening device	400,760	Apr. 2	479	129	47	94
Elder, Joseph, Peoria, Ill. Coal-chute indicator	401,140	Apr. 9	1668	266	47	211

Electric Cable Construction and Maintenance Company. (See Dewees, Thomas J., assignor.)						
Electric Car Company of America. (See Herbert and Angerer, assignors.)						
Electric Cutlery Company. (See Ascheuer, Friedrich, assignor.)						
Electric Cutting Machine Company. (See Rain, Force, assignor.)						
Electrical Accumulator Company. (See Griscom, William W., assignor.)						
Electrical Accumulator Company. (See Pfatischer, Matthias, assignor.)						
Electrical Accumulator Company. (See Prescott, George B., Jr., assignor.)						
Electrical Accumulator Company. (See Price, John B., assignor.)						
Electrical Accumulator Company. (See Sellon, John S., assignor.)						
Electrical Supply Company. (See Phalan, James H., assignor.)						
Electro Dynamic Company. (See Griscom, William W., assignor.)						
Electro-Hydraulic Company. (See McFeely, Ronald F., assignor.)						
Elektron Manufacturing Company. (See Perret, Frank A., assignor.)						
Elias, Abraham J., Buffalo, N. Y. Envelope and stamp moistener	401,141	Apr. 9	1009	286	47	211
Elias, Carl R., Chicago, Ill. Touch-regulator for pianos	405,465	June 18	1618	426 / 427	47	1559
Elkins, William F., assignor of one-half to J. R. Thomas, Comanche, Tex. Sash-fastener	400,554	Apr. 2	186	50	47	40
Ellicott, Charles L., Baltimore County, Md. Lamp-holder for vehicles	401,422	Apr. 16	1499	398	47	306
Elliot, William H., Brooklyn, N. Y. Window-fixture	402,911	May 7	524	138	47	761
Elliott, Charles W., Boston, Mass. Lid for receptacles	400,901	Apr. 9	712	193	47	147
Elliott, Lee, Stuart, Iowa. Grain-meter	405,833	June 25	2192	577	47	1677
Elliott, Robert C., Prairie Creek, Ind. Hame-connection	402,910	May 7	523	138	47	761
Elliott, Walter P., *et al.* (See Hearne, John, assignor.)						
Elliott, Walter S., Hartford, Conn. Sewing-machine fan attachment	404,964	June 11	873	227	47	1404
Elliott, William E., Chicago, Ill. Bearing for journals	402,009	Apr. 23	2404	627	47	485
Ellis, Charles L. (See Phelps and Ellis.)						
Ellis, Cyrenius, and E. E. Benigar, New Martinsburg, Ohio. Lifting device	403,524	May 21	1488	391	47	960
Ellis, Lucien W., Anamosa, Iowa, assignor to W. Deering & Company, of Illinois. Sheaf-carrier for harvesters	401,250	Apr. 9	1255	335	47	246
Ellis, Mollie, Bardstown, Ky. Jar-holding-funnel apparatus	401,487	Apr. 16	1508	422	47	324
Ellis, William O. (See Glover, Charles B., assignor.)						
Elmendorf, Albert, assignor of one-half to S. A. Gardner and C. Prentis, New London, Conn. Water-closet	404,393	June 4	27	7	47	1230
Elmes, Charles F., Chicago, Ill. Hydraulic cylinder for controlling steam-cylinders	404,523	June 4	243	58	47	1270
Elsey, Aaron F., Bardwell, Ky. Fence-post	405,251	June 18	1298	343	47	1494
Elson, Julius. (See Jonson, Julius, assignor.)						
Elwell, Herbert. (See Hovey, Frank A., assignor.)						
Ely, Alfred G., *et al.* (See Peer, John A., assignor.)						
Ely, Charles C., *et al.* (See Peer, John A., assignor.)						
Ely, Edward O. (See Thompson, John B., assignor.)						
Ely, Frederick, *et al.* (See Peer, John A., assignor.)						
Ely, George B., deceased; H. G. Ely, St. Johnsbury, Vt., executor. Hoe-blank	400,902	Apr. 9	713	193	47	147
Ely, Henry G., executor. (See Ely, George B.)						
Embossing Company. (See Hyatt, Charles M., assignor.)						
Emeric, Frank, San Francisco, Cal. Collapsible hand bag or sack	403,928	May 28	2072	544	47	1063
Emerson, Horace G., assignor to H. H. and S. D. Palmer, Rockford, Ill. Cultivator	400,837	Apr. 2	613	167	47	117
Emerson, Loender C., assignor of one-half to C. H. Nelson, North Grafton, Mass. Button-setting machine	405,664	June 18	1951	512	47	1624
Emerson, Samuel G., Belleville, Ontario, Canada. Sectional locking pulley-block	405,541	June 18	1744	460	47	1567
Emerson, Talcott & Company. (See Jones, James H., assignor.)						
Emery, Charles G. (See Brown, Samuel, assignor.)						
Emmens, Stephen H., London, England. High-explosive shell	400,903	Apr. 9	714	193	47	147
Emmons, Enos J. (See Critchfield and Emmons.)						
Empire Hydro Carbon Company. (See Seery, James F., assignor.)						
Empire State Manufacturing Company. (See Coles, John L. and D. H., assignors.)						
Endemann, Hermann, Brooklyn, assignor to L. Wallach, New York, N. Y. Making fertilizers	404,348	May 28	2735	710	47	1209
Engebretsen, Lars, Kampen, Christiania, Norway. Portable chair	404,610	June 4	369	88	47	1295
Engel, Clement, assignor of one-half to I. Prunets, St. Paul, Minn. Car-coupling	405,252	June 18	1299	343	47	1494
Engelhorn, Louis. (See Seyferth, August, assignor.)						
Engle, Peter H., *et al.* (See McClellan, Oscar D., assignor.)						
Englehard, William H., Espey, Pa. Miter-box	401,423	Apr. 16	1501	398	47	306
Ennes, John D., Norfolk, Va. Rubber-dam clamp	402,315	Apr. 30	2874	744	47	583
Eno, Joseph A., Newark, N. J. Steam-generator	404,524	June 4	246	58, 59	47	1270
Enos, Frank, Jr., Norwich, Conn. Lawn-mower	401,606	Apr. 16	1930	504	47	384
Ensign, Frank H., Toledo, Ohio. Metallic wheel	404,611	June 4	370	89	47	1295
Ensor, William D. (See Stockwell and Ensor.)						
Entrikin, Joseph B., Des Moines, Iowa. Rheostat	402,912	May 7	525	130	47	762
Entwistle, Thomas C., *et al.* (See Wilder, Charles W., assignor.)						
Entz, Justus B., New York, N. Y., assignor to T. A. Edison, Llewellyn Park, N. J. Dynamo-electric machine	400,838	Apr. 2	614	167	47	118
Eply, Eliab. (See Doddridge, Loyal M., assignor.)						
Epp, Cornelius C., Bradshaw, Nebr. Gate	402,728	May 7	254	67	47	712
Eppley, Adam L., Springfield, Ohio. Feed-mill	400,447	Apr. 2	34	11	47	10
Erbe, Jacob W., Eisenach, Saxony, Germany. Combined piano and harmonium	402,427	Apr. 30	3050	791 / 792	47	618
Ertel, George, Quincy, Ill. Power mechanism for baling-presses	401,424	Apr. 16	1502	399	47	307
Esbrayat, Emmanuel, Lyons, France. Machine for making wire heddles	403,679	May 21	1994	524	47	1060
Espenschied, Charles, assignor to himself and O. J. A. Doebler, Hastings, Minn. Conveyer for flour, &c	405,994	June 25	2435	642	47	1722
Estes, Nathan C., Smithfield, R. I., assignor of one-half to J. & J. Murdock, Leicester, Mass. Card-setting-machine rest	404,036	May 28	2233	585	47	1113
Ethridge, Martin V. B., Boston, Mass., assignor of two-thirds to J. Swann, New York, N. Y., and H. E. Waite, West Newton, Mass. Time-piece dial	401,697	Apr. 16	1931	504	47	384
Ethridge, Martin V. B., Boston, Mass., assignor of two-thirds to J. Swann, New York, N. Y., and H. E. Waite, West Newton, Mass. Time-piece dial	403,525	May 21	1489	391	47	961
Ettling, Alice M. (See Cately, Shepard W., assignor.)						
Eulner & Lorenz. (See Zabel, Franz A. C., assignor.)						
Eustis, John P., New York, N. Y. Holder for vessels	404,268	May 28	2009	678	47	1186
Eustis, John P., New York, N. Y. Holder for vessels	404,694	June 4	478	121	47	1318
Euston, Alexander, St. Louis, Mo. Cartridge-loader	405,152	June 11	1131	301 / 302 / 303	47	1455

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drs.	Official Gazette. Vol.	Official Gazette. Page.
Evans, Alfred. (See Carr and Evans.)						
Evans, Charles W., Old Compton Street, county of Middlesex, England. Machinery for the manufacture of boot and shoe lasts	404,185	May 28	2477	647, 648, 649	47	1163
Evans, Clarence A. (See Tappey and Evans.)						
Evans, David T., *et al.* (See Strader, Julius G., assignor.)						
Evans, French S., assignor of one-fourth to A. D. Browne, Washington, D. C. Umbrella or parasol	404,695	June 4	478	121	47	1318
Evans, George F., Somerville, Mass. Frictional gearing	401,018	Apr. 9	889	238	47	179
Evans, James W., Kearney, Mo. Composite truss for barns	404,612	June 4	372	89	47	1296
Evans, Joseph A., Philadelphia, Pa. Shuttle-box-operating lever for looms	405,022	June 11	952	254	47	1420
Evans, Lewis W., Upper Tygart, Ky. Nut-lock	401,019	Apr. 9	891	238	47	179
Evans, Philip E., London, England. Shirt and shirt-bosom supporter	403,182	May 14	941	249	47	848
Evans, Richard K., Whiston Grange, Rotherham, county of York, England. Low-pressure steam-motor	401,020	Apr. 9	891	238	47	179
Evans, W. A., *et al.* (See Kelly, John, assignor.)						
Evarts, Charles A., assignor to Bradley & Hubbard Manufacturing Company, Meriden, Conn. Wick-raiser for central-draft lamps	404,186	May 28	2481	649	47	1163
Everett, Edward H., Newark, Ohio. Machine for shaping bottle-necks	400,555	Apr. 2	187	51	47	40
Everett, Edward H., Newark, Ohio. Machine for shaping bottle-necks	400,556	Apr. 2	191	52	47	40
Everitt, Percival, London, England. Coin-operated grip-testing machine	400,839	Apr. 2	616	167	47	118
Everitt, Percival, London, England, assignor to Automatic Perfume Fountain Company, of New Jersey. Vending-machine	402,515	Apr. 30	3188	825, 826	47	642
Everitt, Percival, and W. C. Page, New York, N. Y. Dumping-car	405,700	June 25	2007	527	47	1641
Ewart, John, Lawrence, Mass. Railway-gate operative mechanism	403,929	May 28	2072	544	47	1063
Ewing, Calvin, San Francisco, Cal. Collar-stuffing machine	405,023	June 11	955	255	47	1421
Eysaman, Adam H., Mohawk, N. Y. Whiffletree-hook	403,930	May 28	2074	544	47	1063
Fahrney, Benjamin, Hagerstown, Md. Thill-coupling	405,086	June 11	1039	277	47	1438
Fahys Watch Case Company. (See Eaton, William S., assignor.)						
Faifer, Tony, Denver, Colo. Temporary binder	400,557	Apr. 2	193	52	47	40
Fain, Emmet C., and G. C. Poston, Granbury, Tex. Show-case	402,151	Apr. 30	2639	683	47	538
Fairchild, Ben L., *et al.* (See Newsom, Philip E., assignor.)						
Fairchild, Herman E., Diller, Nebr. Fodder-binder	405,237	June 11	1271	336	47	1462
Falck, Lawrence W., New York, N. Y. Gaff-topsail for vessels	403,257	May 14	1065	280	47	872
Falconnier, Gustave, Nyon, Vaud, Switzerland. Glass building-block	402,073	Apr. 23	2505	654, 655	47	503
Fales, Edward, Cleveland, Ohio. Device for starting cars	403,582	May 21	1563	413	47	975
Falls, Alonzo, Lowell, Mass. Stripping mechanism for carding-engines	403,931	May 28	2074	545	47	1064
Fanning, Eugene, Newton, Mass. Pocket-check and form book	401,324	Apr. 9	1346	359	47	266
Farbenfabriken, vormals Fr. Bayer & Co. (See Frank, Engen, assignor.)						
Faries, Robert, Decatur, Ill. Spring-motor	404,526	June 4	249	59, 60	47	1271
Farkacs, Rudolf. (See Gamper and Farkacs.)						
Farmer, Edward H., Gilroy, Cal. Gang-plow attachment	401,937	Apr. 23	2299	597	47	464
Farmer, James S., Salford, county of Lancaster, England. Apparatus for washing textile fabrics	404,078	May 28	2309	605, 606	47	1130
Farr, Eugene A. Galesburg, Ill. Thill-coupling	402,913	May 7	526	139	47	762
Farr, Hiram G., Boston, Mass. Making battery-zincs	401,338	Apr. 16	1372	.....	47	282
Farrell, John, Hnntsville, N. J. Hay-carrier	404,525	June 4	247	59	47	1271
Farwell, Frederic E., Fitchburg, assignor of one-half to H. A. Hawley, Waltham, Mass. Circular sawing machine	403,890	May 21	1996	594	47	1060
Faught, Luther R., Philadelphia, Pa. Chill for car-wheels	402,664	May 7	165	42	47	695
Faulkner, Alfred, Jersey City, N. J., assignor to E. W. Broadbent, New York, N. Y. Sewing-machine	404,965	June 11	874	228	47	1404
Faulkner, Alfred, Jersey City, N. J., assignor to E. W. Broadbent, New York, N. Y. Sewing-machine	404,966	June 11	876	228	47	1404
Faulkner, Alfred, Brooklyn, assignor to E. W. Broadbent, New York, N. Y. Quilting-machine	405,403	June 18	1512	402, 403	47	1539
Faulkner, Eliab H., Depost, N. Y. Labeling and pasting apparatus	405,466	June 18	1619	427	47	1560
Faust, Ferdinand, Brooklyn, N. Y. Hair-curler	400,904	Apr. 9	715	194	47	148
Faut, Parker. (See Yates, Silas W., assignor.)						
Fawcett, William, Rochester, N. Y. Chill	405,882	June 25	2263	595	47	1690
Fay & Company, J. A. (See Passel, George W., assignor.)						
Feager, John T., St. Louis, Mo. Egg-basket	404,349	May 28	2737	710	47	1210
Fealy, Timothy J., Boston, Mass. Illuminating composition	400,651	Apr. 2	316	.....	47	65
Feary, Frederick T. (See Speicher, John, assignor.)						
Fee, William R., Cincinnati, Ohio, assignor to National Cotton Seed Oil and Huller Company, Memphis, Tenn. Concave for hulling-cylinders	404,037	May 28	2235	586	47	1113
Fee, William R., Cincinnati, and J. S. Zerbe, Hartwell, Ohio, assignors, by mesne assignments, to National Cotton Seed Oil and Huller Company, Memphis, Tenn. Cotton-seed huller	404,696	June 4	479	121, 122	47	1319
Feicker, Fredrick C., Northampton, Mass. Table-cutlery	401,739	Apr. 23	2006	525	47	410
Feicker, Fredrick C., Northampton, Mass. Saw-set	401,740	Apr. 23	2007	525	47	410
Feineman, Louis P., Rochester, N. H. Bracket for papers	405,955	June 25	2385	625	47	1710
Feister, Henry P., Philadelphia, Pa. Paper-cutting machine	400,652	Apr. 2	316	88, 89	47	65
Feister, Henry P., Philadelphia, Pa. Mechanism for cushioning traversing beds of reciprocating machinery	404,394	June 4	20	8	47	1231
Fell, Christopher E. G., Savannah, Ga. Horse-rake	404,269	May 28	2609	679	47	1186
Fellows, Ernest T. (See Fellows, Ernest W., assignor.)						
Fellows, Ernest W., South Chicago, Ill., assignor to E. T. Fellows, New York, N. Y. Hydrocarbon-burner	401,021	Apr. 9	893	239	47	179
	402,729	May 7	255	67	47	712
Fellows, John M., Burlington, Ind. Fence	405,024	June 11	956	255, 256	47	1421
Felt, Dorr E., assignor to Felt & Tarrant Manufacturing Company, Chicago, Ill. Adding-machine						
Felt & Tarrant Manufacturing Company. (See Felt, Dorr E., assignor.)						
Felthousen, Barrent W., Milwaukee, Wis., assignor to Albany Steam Trap Company, of New York. Steam-trap	402,516	Apr. 30	3190	826	47	643
Felthousen, Edward G., assignor of one-half to C. A. Sherwood, Buffalo, N. Y. Lubricator	405,543	June 18	1748	462	47	1586
Felthousen & Sherwood. (See Hart, Thomas J., assignor.)						
Fendel, Charles J., Butte City, Mont. Ter. Grain-drill	401,022	Apr. 9	894	239, 240	47	180
Fendel, Charles J., Anaconda, Mont. Ter. Ore-roaster	401,023	Apr. 9	897	240	47	180
Fenner, George P., New London, Conn. Sheet-delivery apparatus for printing-machines	404,350	May 28	2738	710, 711	47	1210
Fenner, George P., New London, Conn. Sheet-delivery apparatus for printing-machines	405,153	June 11	1140	304	47	1457

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drs.	Official Gazette. Vol.	Official Gazette. Page.
Fenton, Ephraim H., Kansas City, Mo. Grinding-machine for mower and reaper knives	402,152	Apr. 30	2640	684	47	538
Ferguson, Fred H., Buffalo, N. Y. Cooking utensil	405,067	June 11	1040	278	47	1439
Ferguson, Robert, St. Paul, Minn. Compound hydrocarbon-gas generator	404,527	June 4	250	60	47	1271
Ferguson, William E., Montclair, N. J. Apparatus for transferring, weighing, and delivering bags of grain	405,088	June 11	1040	278	47	1439
Ferrall, Thomas R., Boston, Mass., assignor to Boston and Lockport Block Company, of New Jersey. Pulley-block	403,922	May 28	2076	545	47	1064
Ferreira, Charles E., Morgan Park, Ill. Feed-water heater	405,154	June 11	1141	304	47	1458
Ferrenburg, John W., Hege, Ind. Churn	403,337	May 14	1195	317	47	890
Fessenden, Edward H., *et al.* (See Langston, Thomas, assignor.)						
Feust, Sigmund, New York, N. Y. Drawer-pull	402,236	Apr. 30	2753	713	47	561
Fiedler, William, North Adams, Mass. Wax-thread sewing-machine	404,079	May 28	2311	606	47	1130
Field, Charles H., Providence, R. I. Engraving-machine	402,316	Apr. 30	2675	745	47	584
Field, Stephen D., Stockbridge, Mass. Vibratory telegraphy	403,258	May 14	1066	280, 281	47	872
Field, Wallace L. (See Lawson and Field.)						
Fiers, James W., Red Key, Ind. Balanced swinging gate	404,370	May 28	2611	679	47	1186
Fillmore, Adan L., Cincinnati, Ohio. Cylinder-lubricator	400,653	Apr. 2	318	89	47	66
Filstrup, Larsen, Chicago, Ill. Capodastro	402,577	May 7	41	10	47	671
Finch, James B., Newark, N. J., assignor, by mesne assignments, of one-half to T. W. Harris, H. E. Killaly, and H. S. Mack. Combination alarm-lock for windows	401,148	Apr. 9	1067	289	47	213
Fink & Feldhaus. (See Fink, John M., assignor.)						
Fink, John M., assignor to Fink & Feldhaus, Louisville, Ky. Forming flexible saddle-trees	401,938	Apr. 23	2300	597	47	465
Fink, Millard F., Middletown, Md. Apparatus for making wood-and-wire fence	402,815	May 7	396	104	47	737
Finkle, John H., assignor of one-half to E. B. Clark, Appleton, Wis. Potato-digger	405,155	June 11	1144	305	47	1458
Finks, John H. (See Marshall, John F., assignor.)						
Firth, John P., Titusville, Pa. Apparatus for removing gummy matter from oil-wells	403,183	May 14	942	249	47	848
Fischer, August, assignor of one-half to J. F. Potts, White Hall, Ill. Time-piece dial	403,336	May 14	1196	317, 318	47	898
Fischer, Frederick J. W., assignor to Eagle Pencil Company, New York, N. Y. Spring holder or clasp for pens or pencils	404,697	June 4	482	122	47	1319
Fischer, Jonas, Williamsport, Pa. Machine for bundling kindling-wood	402,428	Apr. 30	3002	792	47	619
Fisher, Alva J., Chicago, Ill. Chaplet for sand cores	404,187	May 28	2482	649	47	1163
Fisher, Charles H., assignor of one-half to E. L. Bartlett and L. A. Hughes, Santa Fé, N. Mex. Ter. Paper-holder	402,237	Apr. 30	2754	714	47	561
Fisher, Dedrich, *et al.* (See Welch, James E., assignor.)						
Fisher, Frank E., Detroit, Mich. Contact device for electric railways	405,544	June 18	1750	462	47	1586
Fisher, Lucius G., *et al.* (See Solano, Renaldo, assignor.)						
Fisher Oil Burner Company. (See Fisher, William L., assignor.)						
Fisher, William F., Buffalo, N. Y. Self-acting unlocking-link	404,903	June 11	780	199	47	1385
Fisher, William L., assignor to Fisher Oil Burner Company, Flint, Mich. Hydrocarbon-burner	401,149	Apr. 9	1068	289	47	213
Fitch, Horace A. (See Moore and Fitch.)						
Fitz Gerald, Augustine F., Brooklyn, assignor to Van Derveer & Holmes Biscuit Company, New York, N. Y. Cracker-stacking machine	403,526	May 21	1492	391, 392	47	961
Fitzpatrick, Annie M. (See Fitzpatrick, Michael, assignor.)						
Fitzpatrick, Hugh F., New York, N. Y., assignor to E. K. Conover, Newark, N. J. Air-compressor	402,517	Apr. 30	3192	826, 827	47	643
Fitzpatrick, Michael, assignor to A. M. Fitzpatrick, St. Louis, Mo. Shutter-fastener	403,259	May 14	1072	281	47	873
Fitzpatrick, William J., South Boston, Mass. Gearing for bicycles	401,425	Apr. 16	1504	399	47	307
Fitzsimmons, George T., West Chester, Pa. Pipe-trimming device	403,928	May 21	1925	506	47	1046
Flad, Henry, St. Louis, Mo. System of rapid transit	405,306	June 18	1377	363	47	1510
Flad, Henry, St. Louis, Mo. System of rapid transit	405,467	June 18	1621	427, 428	47	1560
Flad, Henry, St. Louis, Mo. Street cable railway	405,468	June 18	1625	428, 429, 430	47	1561
Flad, Henry, St. Louis, Mo. System of rapid transit	405,709	June 25	2109	552, 553	47	1660
Flad, John F., Philadelphia, Pa. Folding carriage	401,939	Apr. 23	2301	598	47	465
Flagg, Margaret R. (See Winegardner, William H., assignor.)						
Flagler, John H., New York, N. Y. Making metal tubing	401,142	Apr. 9	1070	286	47	211
Flagler, John H., New York, N. Y. Apparatus for the manufacture of metal tubing	401,143	Apr. 9	1072	286, 287	47	211
Flagler, John H., New York, N. Y. Apparatus for the manufacture of metal tubing	401,144	Apr. 9	1075	287	47	212
Flagler, John H., New York, N. Y. Forming seamless tubing	401,145	Apr. 9	1078	287, 288	47	212
Flagler, John H., New York, N. Y. Apparatus for welding tubing	401,146	Apr. 9	1081	288	47	212
Flake, Gideon, assignor to T. I. Rushton, Centre Valley, Ind. Gate	402,578	May 7	42	10	47	671
Flannery, Joseph, *et al.* (See Hearne, John, assignor.)						
Flatow, Simon J., assignor of one-half to L. Sieber, New York, N. Y. Machine for wrapping cigars	401,147	Apr. 9	1084	288, 289	47	213
Fleetwood, Caleb V., Cleves, Ohio. Petroleum-burner	401,741	Apr. 23	2009	525	47	410
Fleischhauer, Louis, assignor of one-third to J. Wohlert, Perry, Tex. Washing-machine	403,929	May 21	1926	506, 507	47	1047
Fleischmann, Lawrence M., Wichita, Kans. Lubricator	400,761	Apr. 2	490	129	47	94
Fleming, Jefferson, Kansas City, Mo. Ground-auger	404,188	May 28	2483	649	47	1163
Fletcher, Archibald F., Brooklyn, assignor of two-thirds to V. Gleason, New York, N. Y., and J. V. Carraher, Washington, D. C. Hydrocarbon-burner	400,905	Apr. 9	716	194	47	148
Fletcher, Horatio, Newcastle-upon-Tyne, county of Northumberland, England. Combined drum and gripper	401,727	Apr. 16	1962	519	47	305
Fletcher, Richard H., Socorro, N. Mex. Ter. Bicycle	401,339	Apr. 16	1373	365, 366	47	282
Flick, Joseph H. (See Killeen, Bernard, assignor.)						
Flint, Henry B., Bethel, Me. Heating apparatus	402,153	Apr. 30	2642	684	47	539
Flint, Henry S., Providence, R. I. Apparatus for sewing ingrain carpets	405,834	June 25	2193	577, 578	47	1677
Flood, George W., assignor of two-thirds to E. G. Maxwell and W. B. O. Sands, Pentwater, Mich. Chute for feeding sawdust to steam-boilers	403,830	May 21	1927	507	47	1047
Flood, John J., *et al.* (See Chase, Addison K., assignor.)						
Flood, Joseph T., assignor to Buchanan, Bolt & Co., Holyoke, Mass. Machine for making paper	403,744	May 21	1796	473	47	1021
Florsheim, Simon, *et al.* (See Gardner, Marshall, assignor.)						
Flostrey, Mary A. S. (See Taggart, Francis, assignor.)						
Flues, Conrad B., Jackson, Mich. Brow-band for bridles	405,307	June 18	1360	363	47	1511

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Flynn, James, Boston, Mass. Fire-escape	400,656	Apr. 2	319	90	47	66
Foerster, Emanuel, New York, N. Y. Pipe-cutter	402,730	May 7	256	67	47	712
Folk, Reuben. (See Katherman and Folk.)						
Follansbee, George S., Boston, Mass. Sealing device for water-meters	404,395	June 4	31	8	47	1231
Follansbee, Lambert T., Washington, D. C. Trap	404,271	May 28	2612	679	47	1186
Follett, Joseph L. (See Daboll and Follett.)						
Follett, Joseph L., Brooklyn, N. Y. Oscillating loop taker and spreader for sewing-machines	402,429	Apr. 30	3065	793	47	619
Follett, Joseph L., Brooklyn, N. Y. Mechanical movement	402,430	Apr. 30	3067	793	47	619
Folmer, William F., assignor of one-half to W. E. Schwing, New York, N. Y. Gas-burner	404,830	June 11	669	173	47	1366
Folz, Joseph. (See Dietrich, Engelbert, assignor.)						
Foote, James B., assignor of one-half to G. E. Maxwell, Delancey, N. Y. Ladder-hook	401,742	Apr. 23	2010	526	47	410
Forbes, William H. (See Clark, Dwight S., assignor.)						
Forbes, William H. (See Osborne, John W., assignor.)						
Forbes, William H., and J. Gibson, Boston, Mass. Fluid-measuring apparatus	403,933	May 28	2077	545	47	1084
Force, Jacob F. (See Langenbach, Charles J., assignor.)						
Ford, George A., Cleveland, Ohio. Tackle-block	401,150	Apr. 9	1090	290	47	214
Ford, James H., New York, N. Y., and M. Jurwick, Jersey City, N. J.; said Jurwick assignor to said Ford. Photographic camera	403,994	May 28	2166	569	47	1100
Ford, John C., Beverly, Mo., assignor to W. Rees & Co., Keokuk, Iowa. Form-cylinder for printing-machines	403,423	May 14	1328	348	47	922
Ford, William W., Elmira, N. Y. Wash-boiler	401,879	Apr. 23	2209	578	47	448
Forestier, Maria M., Brussels, Belgium. Stop-cock	405,404	June 18	1514	403	47	1539
Forman, Jonathan C., Cleveland, Ohio. Paper-ruling machine	401,151	Apr. 9	1091	290	47	214
Forrest, Robert W., *et al.* (See MacArthur, John S., assignor.)						
Forrest, William, *et al.* (See MacArthur, John S., assignor.)						
Forrester, Peter C, Wilkeson, Wash. Ter. Pinch-bar	403,184	May 14	943	250	47	848
Forsaith, Thomas, Adelaide, South Australia. Saw for cutting tenons	400,906	Apr. 9	718	194	47	148
Forster, Thomas V. (See Woodhouse and Forster.)						
Forsyth, John H., Fargo, Dak. Ter. Automatic grain-scale	405,728	June 25	2050	539	47	1649
Fort Wayne Electric Light Company. (See Slattery, Marmaduke M. M., assignor.)						
Fortney, Charles H., Montgomery's Ferry, Pa. Road-cart	405,545	June 18	1751	463	47	1588
Fosdick, Charles, Fitchburg, Mass. Crank-shaft	402,010	Apr. 23	2406	627	47	485
Fosati, Jasper, Inez, Tex. Bed drier and warmer	403,339	May 14	1198	318	47	898
Foster, Charles E., Washington, D. C., assignor to Hydraulic Elevator Company, Chicago, Ill. Hydraulic engine	404,528	June 4	251	60	47	1272
Foster, Charles H., Alameda, Cal. Sash-fastener	402,816	May 7	397	104	47	738
Foster, Edwin B., *et al.* (See Davis, John W., assignor.)						
Foster, Horace F., and E. L. Webster, Milo, Mo. Car-coupling	402,579	May 7	44	11	47	672
Foster, John W., Pawtucket, R. I., assignor of one-half to G. E. Manning, Taunton, Mass. Spooling-machine	404,831	June 11	671	{173 174}	47	1366
Foster, Jonas R., Stoneham, Mass. Pencil-sharpener	402,914	May 7	527	139	47	762
Foster, Marshal T. (See Patterson and Foster.)						
Foster, Michael A., St. Louis, Mo. Furnace	401,546	Apr. 16	1693	{446 447}	47	341
Foster, Michael A., St. Louis, Mo. Jet attachment for furnaces	405,956	June 25	2386	625	47	1710
Foster, Robert, assignor to F. R. Jennings, W. B. Harris, and J. A. Dixon, Indianapolis, Ind. Valve	401,647	Apr. 16	1669	485	47	372
Foster, Robert F., Baltimore, Md., assignor of one-half to A. J. Leith, New York, N. Y. Playing-card	404,782	June 4	597	155	47	1343
Foster, William J., Hoboken, N. J. Machine for lettering the covers of books	404,189	May 28	2484	650	47	1164
Foulon, Peter J., New York, assignor of one-half to G. B. Constantine, Brooklyn, N. Y. Argand lamp-burner	404,474	June 4	158	37	47	1254
Foust, James W., Sterling, Ill. Hay-loader	403,041	May 7	708	{185 186}	47	797
Fowler, Elbert W., Chicago, Ill., assignor to Yale & Towne Manufacturing Company, Stamford, Conn. Device for operating safe bolt-work	403,527	May 21	1495	{392 393}	47	962
Fowler, George H., Taughannock Falls, N. Y. Road-cart	403,745	May 21	1800	473	47	1022
Fowler, Joseph C., and E. A. Henkle, Washington, D. C. Paper-folding machine	400,762	Apr. 2	481	129	47	94
Fowler, Nathaniel C., Jr., Winthrop, Mass., assignor to Pope Manufacturing Company, Portland, Me. Copy-holder or easel for use with type-writing machines	402,518	Apr. 30	3194	827	47	644
Fowler, William H., Newton, Mass. Shoe-shank machine	402,431	Apr. 30	3068	794	47	620
Fox, Charles B. (See Wales, Sigourney, assignor.)						
Fox, Christian A. (See Cooper, William H., assignor.)						
Fox, John R., Fort Wayne, Ind. Electric-arc lamp	404,351	May 28	2739	711	47	1210
Foy, Edward A., Cincinnati, Ohio. Glass knob	403,340	May 14	1199	318	47	898
Fraenkel, Max, New Orleans, La. Trousers, &c	403,746	May 21	1801	473	47	1022
Francis, John H., *et al.* (See Abell, Robert T., assignor.)						
Francken, Victor, and J. Pirnay, Liege, Belgium. Turf-fiber surgical dressing	401,547	Apr. 16	1694	447	47	341
Frank, Eugen, assignor to Farbenfabriken, vormals Fr. Bayer & Co., Elberfeld, Prussia, Germany. Yellow dye	401,924	Apr. 9	899		47	181
Frantzen, Paul, Chicago, Ill. Clasp	401,880	Apr. 23	2210	578	47	448
Fraser, Daniel D., Boston, Mass. Attaching device for whip-sockets	403,360	May 14	1073	281	47	873
Fraunfelter, Frank, *et al.* (See Selbel, Frederick H., assignor.)						
Frayer, Charles A., Keithsburg, Ill. Oil-can	403,042	May 7	709	186	47	798
Frazer, Daniel A., Mancelona, Mich., assignor of two-thirds to O. S. and L. N. Rodenbaugh. Reversing-gear for steam-engines	403,881	May 21	1997	525	47	1060
Frazer, Robert S., *et al.* (See Gearing, Charles M., assignor.)						
Frederick, Augustus, Essex, N. Y. Fire-escape ladder and truck	401,488	Apr. 16	1600	422	47	325
Fredericks, John H., Lock Haven, Pa. Sifter	401,548	Apr. 16	1695	447	47	341
Fredericks, Rowland W. (See Burns, John, assignor.)						
Freed, Moses, New York, N. Y. Finger-ring	402,011	Apr. 23	2408	627	47	485
Freeman, David H., Brazil, Tenn. Car-coupling apparatus	403,341	May 14	1199	{318 319}	47	898
Freeman, Henry, assignor to Thorne Machine Company, Hartford, Conn. Type-case	402,317	Apr. 30	2877	745	47	584
Freeman, Michael, assignor to S. Freeman & Sons Manufacturing Company, Racine, Wis. Seed-sower	403,882	May 21	1999	525	47	1060
Freeman & Sons Manufacturing Company, S. (See Freeman, Michael, assignor.)						
Freeman, Stephen, Racine, Wis. Grain-separator	402,012	Apr. 23	2409	328	47	485
Frees, Chancy A., New York, N. Y. Artificial leg	401,426	Apr. 16	1506	399	47	307
Freese, John S., Brooklyn, N. Y. Button-hole sewing-machine	403,342	May 14	1201	{319 320}	47	899
Freese, John S., Brooklyn, N. Y. Button-hole sewing-machine	403,434	May 14	1329	{348 349}	47	922

Hart, Charles L., assignor to E. W. Bliss Company, Brooklyn, N. Y. Stamping-press	402,668	May 7	172	44	47	696
Hart, Delos. (See Souders, Addison J., assignor.)						
Hart, Frederick, Poughkeepsie, assignor to D. H. Burrell & Company, Little Falls, N. Y. Means for lubricating centrifugal separators	405,212	June 11	1235	328	47	1475
Hart, Lewis B., Plaquemine, La. Implement for boring wells	403,751	May 21	1806	475	47	1023
Hart, Stacy B., Peoria, Ill. Elevator for grain-separators	402,522	Apr. 30	3202	820	47	645
Hart, Thomas J., assignor to Felthousen & Sherwood, Buffalo, N. Y. Lubricator	405,895	June 25	2267	596	47	1691
Harter, Adam, Apple Creek, Ohio. Car-coupling	404,063	May 28	2315	607	47	1131
Harter, John M. (See Harsh, Samuel E., assignor.)						
Hartford, Arthur J., New York, N. Y., assignor to A. J. Hartford Steel Railway Tie Manufacturing Company, of West Virginia. Metallic railway-tie	401,949	Apr. 23	2316	602	47	468
Hartford Compressed Air Pump Company. (See Merrill, Amos B., assignor.)						
Hartford Compressed Air Pump Company. (See Merrill, Frank H., assignor.)						
Hartford Steel Railway Tie Manufacturing Company, A. J. (See Hartford, Arthur J., assignor.)						
Hartman, Charles R., Vincennes, Ind. Cultivator	404,084	May 28	2316	607 608	47	1132
Hartman, Charles R., Vincennes, Ind. Cultivator	404,085	May 28	2320	608	47	1132
Hartman, Jacob B., Wooster, Ohio. Handle	401,832	Apr. 23	2144	569	47	435
Hartman, John W., Mapleton, and H. P. Clay, Prescott, Kans. Wagon-brake	400,675	Apr. 2	350	98	47	72
Hartung, Lewis B., Canton, Ohio. Heating apparatus	400,453	Apr. 2	41	13	47	12
Harvey, Edmund A., Wilmington, Del., assignor to McDaniel & Harvey Company, Philadelphia, Pa. Apparatus for coating or galvanizing sheet metal	403,044	May 7	712	186 187	47	798
Harvey, George H., Pittsburg, Pa. Furnace and apparatus for producing and burning gaseous vapors	403,839	May 21	1944	511	47	1050
Harvey, Hayward A. (See Quimby, Edward E., assignor.)						
Harvey, William F., Lewiston, Me. Shawl-strap	405,998	June 25	2460	643	47	1723
Harwood, Herbert J., Littleton, assignor to Harwood Manufacturing Company, Boston, Mass. Folding chair or settee	404,836	June 11	683	176	47	1368
Harwood, John, Somerville, Mass. Clock-movement holder	405,258	June 18	1311	345	47	1497
Harwood Manufacturing Company. (See Harwood, Herbert J., assignor.)						
Harwood, Thomas T. H., Rockport, Mass. Package-fastener	405,775	June 25	2116	555	47	1662
Hasbrouck, Alfred, Ithaca, N. Y. Driving-gear for locomotives	402,322	Apr. 30	2884	748	47	585
Hasbrouck, Alfred, Ithaca, N. Y. Steam-generator	405,837	June 25	2198	578 579	47	1678
Haskell, Henry L., Ludington, Mich. Cutter-head	400,567	Apr. 2	205	55	47	44
Haskins, Charles D., Brooklyn, N. Y., assignor to Western Electric Company, Chicago, Ill. Quadruplex telegraphy	405,211	June 11	1234	327	47	1475
Hassel, Richard, Burlington, Iowa. Buckle	402,591	May 7	61	14	47	675
Hastings, Charles R., Buffalo, N. Y. Manner of jointing railway-rails	404,278	May 28	2026	532	47	1189
Hastings, George W., Grafton, assignor to E. M. Wood, Natick, Mass. Polishing compound	404,483	June 4	169	.....	47	1256
Hatch, Adin A., assignor to B. F. Jones, E. L. Martin, and A. W. Jones, Kansas City, Mo. Electrical signaling apparatus	403,104	May 14	817	217	47	825

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Hatch, Albert T., South Elgin, Ill. Whiffletree and hook	403,664	May 21	1674	444	47	998
Hatch, Walter P., Pullman, Ill. Shears	401,168	Apr. 9	1112	295	47	218
Hathaway, George H., Boston, assignor of one-half to W. A. Perry, Winchester, Mass. Sand-box for street-cars	402,523	Apr. 30	3204	830	47	645
Hathaway, George M., New York, N. Y., and E. B. Stocking, Washington, D. C. Cupola or blast furnace	404,908	June 11	788	201	47	1387
Hattersley, Alfred, Fort Wayne, Ind. Safety-cushion for water-pipes	404,980	June 11	879	229	47	1405
Haug, John, Philadelphia, Pa. Quadruple-expansion engine	403,206	May 14	1085	286 287	47	875
Haughawout, John W., Omaha, Nebr. Snow-plow	403,665	May 21	1676	445	47	998
Haughey, Michael, St. Louis, Mo. Carriage	404,405	June 4	45	12	47	1234
Hausmann, McComb & Dunn. (See Scheffer, David M., assignor.)						
Hauseling, Henry A., *et al.* (See Haley, Charles C., assignor.)						
Hausemann, Hermann, Chicago, Ill. Veterinary incisor-cutter	403,105	May 14	823	218	47	826
Hausemann, Hermann, Chicago, assignor of two-thirds to S. B. Dunn and J. C. McComb, Cook County, Ill. Hypodermic syringe	401,950	Apr. 23	2316	602	47	468
Havens, William R., and S. E. Reaugh, Denver, Colo. Manufacturing artificial stone	404,040	May 28	2238	580	47	1113
Haviland, Joseph H., assignor to W. F. McGee, Jackson, Mich. Corset-clasp	401,650	Apr. 16	1572	406	47	373
Hawes, William L., assignor of one-half to Standard Wagon Company, Cincinnati, Ohio. Hub-band	404,837	June 11	684	176	47	1368
Hawes, William L., assignor of one-half to Standard Wagon Company, Cincinnati, Ohio. Vehicle-wheel hub	404,838	June 11	684	177	47	1368
Hawes, William L., assignor of one-half to Standard Wagon Company, Cincinnati, Ohio. Point-band for vehicle-hubs	404,839	June 11	685	177	47	1368
Hawk, Fletcher, Lebanon, Ohio. Appliance for illustrating spherical trigonometry	405,354	June 18	1443	362	47	1524
Hawkins, John T., Taunton, Mass. Inking apparatus for printing-presses	402,447	Apr. 30	3088	800 801	47	623
Hawkins, John T., Taunton, Mass. Pipe-wrench	404,619	June 4	380	92	47	1298
Hawley, Henry A. (See Farwell, Frederic E., assignor.)						
Hawley, James M., Odin, Ill. Gate	404,086	May 28	2322	608	47	1133
Haworth, George D., Decatur, Ill. Seed-planter	402,669	May 7	174	44	47	696
Hawthorne, Samuel R., Middlebury, Vt. Snow and ice guard	401,559	Apr. 16	1710	451	47	344
Hay & Todd Manufacturing Company. (See Kneip, William F., assignor.)						
Hayden & Derby Manufacturing Company. (See Desmond, John, assignor.)						
Hayden, Hiram W., assignor to Holmes, Booth & Haydens, Waterbury, Conn. Lamp	405,032	June 11	972	258	47	1425
Hayden, Jeremiah, Raymond, Me. Truss	400,454	Apr. 2	42	13	47	12
Hayes, Caldwell, Oskaloosa, Kans. Ironing device	403,045	May 7	714	187	47	799
Hayes, George, New York, N. Y. Machine for making metallic lathing	402,240	Apr. 30	2757	714 715	47	561
Haynes, Gideon, Jr., Hingham, assignor to Springfield Bicycle Manufacturing Company, Boston, Mass. Treadle for bicycles	402,926	May 7	547	145	47	766
Haya, James P., and H. E. Clemens, Wellsville, Kans. Combined wire stretcher, tightener, and splicer	400,676	Apr. 2	360	98	47	72
Hazelton, Milton W., Chicago, Ill. Feed-water heater and purifier	400,677	Apr. 2	361	99	47	72
Heacock, Elmer E., Strawn, Kans. Combination-tool	404,001	May 28	2177	571	47	1103
Heacock, Howard P., Missoula, Mont. Ter. Saw-mill feed-works	404,002	May 28	2178	572	47	1103
Head, Frederick A., Rock Island, Ill. Cultivator	403,587	May 21	1574	415	47	977
Heady, Winfield S. (See Craddick and Heady.)						
Healy, Byron J., Kalamazoo, Mich. Vehicle-spring	403,666	May 21	1677	445	47	999
Heap, James H. (See White and Wallbank, assignors.)						
Heard, Lucas A. (See Lathrop and Heard.)						
Hearne, John, assignor to J. Flannery and W. P. Elliott, New York, N. Y. Slide-valve for gas-meters	404,970	June 11	880	229	47	1405
Heath, Amasa C., and F. H. White, South Easton, Mass. Rotary cutter	403,667	May 21	1678	445	47	999
Heath, Mark A., assignor to himself and J. S. Lynch, Providence, R. I. Bale-covering	403,046	May 7	714	187	47	799
Heaviside, Arthur W., Newcastle-upon-Tyne, England. Electric-wire insulator	402,592	May 7	62	15	47	675
Hebden, Frank, Philadelphia, Pa. Shuttle-box-pattern mechanism for looms for weaving fabrics having end borders	401,702	Apr. 16	1938	505	47	385
Hebden, William, Boston, Mass. Machine for sponging cloth	404,620	June 4	381	92	47	1298
Heberling, Henry. (See Heberling, William L. and H.)						
Heberling, William L. and H., Havana, Ill. Roofing-package	405,311	June 18	1386	365	47	1513
Heckel, George B., and G. James, assignors to Rand, McNally & Company, Chicago, Ill. Map-case	405,666	June 18	1954	513	47	1625
Heckmann, Fred, Philothea, Ohio. Bundle-carrier	401,032	Apr. 9	910	242	47	182
Hedges, Samuel P., Greenport, N. Y. Steam-boiler	400,568	Apr. 2	205	58	47	44
Heermans, Thaddeus W., Chicago, Ill., assignor to Crane Elevator Company, of Illinois. Safety device for elevators	403,668	May 21	1679	446	47	999
Heffley, William H., Osage Mission, Kans. Baling-press	400,912	Apr. 9	725	196 197	47	149
Heffron, John, *et al.* (See Irving, Mark E., assignor.)						
Heggan, James, Perth Amboy, N. J., assignor to S. M. Schwab, Jr., & Co., New York, N. Y. Sewing-machine	405,776	June 25	2116	555 556	47	1662
Heggem, Charles O., assignor to Russell & Company, Massillon, Ohio. Traction-engine	400,846	Apr. 2	626	170	47	120
Heggem, Charles O., assignor to Russell & Company, Massillon, Ohio. Steam-engine	400,847	Apr. 2	627	170 171	47	121
Heidel, Gustavos, assignor to National Self Heating Sad Iron Company, St. Louis, Mo. Ironing-machine	400,678	Apr. 2	363	99	47	72
Heidel, Gustavos, and G. Frey, assignors, by mesne assignments, to National Self Heating Sad Iron Company, St. Louis, Mo. Self-heating soldering-iron	400,455	Apr. 2	43	13	47	12
Helm, Charles J. P., St. Louis, Mo. Hose-bridge	404,970	May 28	2027	582	47	1189
Heim, Hermann, Ober-Döbling, near Vienna, Austria-Hungary. Heating apparatus	401,349	Apr. 16	1390	308	47	226
Heimann, Salomon, New York, assignor of five-twentieths to F. L. Pommer, Stapleton, N. Y. Insulated wire	403,267	May 14	1087	287	47	876
Heine, August. (See Wheatley, John B., assignor.)						
Heinemann, Theodore P., assignor of one-half to F. T. Roots, Connersville, Ind. Preparing designs for advertising-cards	401,164	Apr. 9	1113	295	47	219
Heinemann, Theodore P., assignor of one-half to F. T. Roots, Connersville, Ind. Producing variable signs and advertising-cards	401,165	Apr. 9	1113	295	47	219
Heinold, Samuel L., Anderson, Ind. Combination-tool	401,821	Apr. 23	2133	557	47	432
Heinzmann, William. (See Maeurer, Henry, assignor.)						
Heister, Charles L., assignor of one-half to E. Nichols, Dunkirk, N. Y. Corn-sheller	405,838	June 25	2200	579	47	1678
Heisler, John. (See Rose, Charles O., assignor.)						
Helios, Actien-Gesellschaft für Elektrisches Licht und Telegraphenbau. (See Coerper, Carl, assignor.)						
Helman, George S., *et al.* (See Kelly, John, assignor.)						
Helmer, Nicolas, and C. L. Lietz, New York, N. Y. Hair-crimping device	404,087	May 28	2323	609	47	1133

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Helvey, George H., assignor to Hooven, Owens & Rentschler Company, Hamilton, Ohio. Traveling crane	402,524	Apr. 30	3305	830	47	646
Hemingway Manufacturing Company. (See Boggs, Henry H., assignor.)						
Hempstead, Charles S., Fairchance, Pa. Credit or store order	400,569	Apr. 2	207	56	47	44
Hench, Samuel N., and W. A. Dromgold, York, Pa. Spring-tooth harrow	402,079	Apr. 23	2514	657	47	505
Henderson, Charles, Glasgow, Scotland. Collapsible boat	403,470	May 14	1395	365 366	47	934
Henderson, Charles H., assignor to Canton Glass Company, Canton, Ohio. Grinding-machine	404,787	June 4	606	156	47	1344
Henderson, John G., Keokuk, Iowa. Washing-machine	402,927	May 7	548	145	47	766
Henderson, John W., Philadelphia, Pa. Electric car	402,080	Apr. 23	2515	657	47	505
Henderson, Samuel, Millville, N. J. Guide-tube for spinning-frames, &c	401,350	Apr. 16	1303	360	47	296
Henderson, Thomas, Liverpool, England. Grate for furnaces	403,840	May 21	1946	511	47	1050
Henkle, Asa C. (See Henkle, Curran W. and A. C.)						
Henkle, Curran W. and A. C., Washington Court-House, Ohio. Scaffold-fastening	405,734	June 25	2060	541	47	1651
Henkle, Edward A. (See Fowler and Henkle.)						
Henkle, Leonard, Rochester, N. Y. Gas-burner	405,735	June 25	2061	541	47	1651
Henkle, Leonard, Rochester, N. Y. Incandescent gas-burner	405,736	June 25	2062	541	47	1651
Henly, Thomas G., London, England. Apparatus for steeping flax	405,091	June 11	1045	279	47	1440
Hennicke, Charles A. (See Baynes and Hennicke.)						
Henrard, Dieu D. (See Jensette and Henrard.)						
Henrard, Henri. (See Jensette and Henrard.)						
Henry, Benjamin T., New Haven, Conn. Axle-box	405,737	June 25	2064	542	47	1651
Henry, Dennis B., Indian Bayou, La. Planter and cultivator	403,456	Apr. 2	44	14	47	12
Henry, John, Ardock, Dak. Ter. Automatic grain-weigher	403,189	May 14	949	251	47	850
Henry, John S., assignor of one-half to G. L. Denison, Stonington, Conn. Wrench	405,259	June 18	1311	346	47	1497
Henry, Rene L. (See Henry, Robert G. and R. L.)						
Henry, Robert G., Waterbury, and R. L. Henry, Hamden, Conn. Buckle	404,406	June 4	47	13	47	1234
Hent, Reuben W., San Francisco, Cal. Roller-bearing	401,184	Apr. 23	2215	579	47	449
Hentschel, Augustin, Berlin, Germany. Machine for melting snow and cleaning streets	401,496	Apr. 16	1612	425 426	47	327
Hepburn, Lewis L., New Haven, Conn. Magazine-gun	400,679	Apr. 2	363	99	47	72
Hepinstall, William H. (See Groark, Richard, assignor.)						
Herber, Samuel M., assignor to T. R. Peifer, Lincoln, Ill. Pillow-block	403,471	May 14	1398	366	47	934
Herbert, George W., Birmingham, county of Warwick, and S. Guinery, Epsom, county of Surrey, England; said Guinery assignor to said Herbert. Safety-pin	404,003	May 28	2179	572 573	47	1104
Herbert, Henry G., Chicago, Ill. Hot-air furnace	402,323	Apr. 30	2876	748	47	585
Herbet, David E., Amsterdam, N. Y. Inhaler	402,563	May 7	63	15	47	676
Hereknor, Emil. (See Atwater and Hereknor.)						
Herdman, George A., London, county of Middlesex, England. Felt roofing	403,588	May 21	1575	416	47	977
Herendeen, Edward W. (See Harris, John W., assignor.)						
Herendeen, Edward W., Geneva, N. Y. Spring-tooth harrow	401,833	Apr. 23	2145	560	47	435
Herman, Emil J., assignor to Safety Hatch-Door Company, St. Louis, Mo. Self-closing hatchway	404,705	June 4	490	124	47	1320
Hermance, Robert, Schuylersville, N. Y. Tubular lantern	404,538	June 4	265	61	47	1275
Herrick, Frank J., New Britain, Conn. Waist-belt loop	405,886	June 25	2070	596	47	1651
Herron, William E. E. (See Whittier and Herron.)						
Horsh, John R., and J. M. Staley, Dayton, Ohio. Sprocket-wheel	402,448	Apr. 30	3090	801	47	624
Hertel, Henry, assignor to W. Lang Company, Brooklyn, N. Y. Spring-hinge	402,324	Apr. 30	2887	748	47	585
Herz, Otto. (See Albrecht, Johannes, assignor.)						
Herzig, Edward, West Hoboken, assignor to R. H. Simon, Union, N. J. Stop mechanism for looms	404,407	June 4	48	13	47	1234
Hess, John G., Westminster, Md. Road-cart	401,834	Apr. 23	2146	560	47	435
Hesse, Charles, Danville, Ill. Washing-machine	403,669	May 21	1621	446	47	999
Hester, Henry G., New Orleans, La. Elevator-hatchway	401,273	Apr. 9	1275	340	47	250
Heuser & Co., Franz. (See Andre, Emil, assignor.)						
Heverin, Charles L., Philadelphia, Pa. Hydrocarbon-burner	402,241	Apr. 30	2779	715	47	562
Heverin, Charles L., Philadelphia, Pa. Burning hydrocarbon oil	402,242	Apr. 30	2781	715	47	562
Hewitt, Leslie, assignor of one-half to Pratt & Letchworth, Buffalo, N. Y. Combined snap-hook and loop	405,887	June 25	2270	597	47	1691
Hewitt, William, assignor of one-half to F. B. Pollard, London, Ontario, Canada. Sulky harrow	402,670	May 7	176	45	47	697
Heysinger, Isaac W., Philadelphia, Pa. Self-closing cover for inkstands, &c	404,539	June 4	267	64	47	1275
Heysinger, Isaac W., Philadelphia, Pa. Skein-holder	405,411	June 18	1525	405	47	1541
Hiatt, Elwood E., Noblesville, Ind. Bed-furnace	404,220	May 28	2630	682	47	1189
Hibbert, William, Manchester, county of Lancaster, England. Apparatus for purifying atmospheric air	404,021	June 4	382	92	47	1298
Hibbets, James S., Ludell, Kans. Seeding attachment for plows	402,243	Apr. 30	2762	715 716	47	562
Hicks, John C., Minneapolis, Minn. Chain for stock-car partitions	401,274	Apr. 9	1275	340	47	250
Hicks, Charles E., Somerville, Mass. Writing-case	402,244	Apr. 30	2767	716	47	563
Hicks, Henry C., Minneapolis, Minn. Self-propelling motor	405,553	June 18	1760	465	47	1590
Hicks Induction-Light and Motor Company. (See Hicks, Thomas H., assignor.)						
Hicks, Oliver H., Chicago, Ill. Toilet-paper roll	400,913	Apr. 9	728	197	47	149
Hicks, Oliver H., Chicago, Ill. Package of toilet-paper	404,622	June 4	384	92	47	1298
Hicks, Oliver H., Chicago, Ill. Perforated paper	405,412	June 18	1528	405	47	1542
Hicks, Oliver H., Chicago, Ill. Paper box for cigars	405,413	June 18	1530	405	47	1542
Hicks, Thomas H., Detroit, Mich., assignor to Hinds Induction-Light and Motor Company, of Michigan. System of electrical distribution and conversion	402,671	May 7	178	45	47	697
Hicks, Thomas H., Detroit, Mich., assignor to Hicks Induction-Light and Motor Company, of Michigan. Secondary battery	405,213	June 11	1236	328	47	1475
Hicks, William A., Rankin Station, Pa. Combined hand-cuffs and nippers	403,368	May 14	1088	287	47	876
Hieronymus, Jasper N., Fairbury, Ill. Machine for shocking sheaves of small grain	404,449	Apr. 30	3091	802	47	624
Higgins, Clinton D. (See Cockfield and Higgins.)						
Higgins, Daniel, assignor to himself and J. J. Costello, Boston, Mass. Sewer-trap	403,106	May 14	821	218	47	826
Higgins, Freeman, Manchester, N. H. Lathe-chuck	403,589	May 21	1576	416	47	977
Higgins, George B., North Indianapolis, Ind. Basket	402,825	May 7	412	108	47	710
Higginson, John, St. Louis, Mo. Car-truck bolster	405,703	June 25	2012	529	47	1642
Higgison, Charles W. (See Porter, Andrew C., assignor.)						
Higham, Daniel, assignor to Higham Electric Motor Company, Philadelphia, Pa. Prevention of sparking in electric motors and generators	400,680	Apr. 2	366	99	47	73
Higham Electric Motor Company. (See Higham, Daniel, assignor.)						
Higinbotham, Harry G. (See Burnett, Charles N., assignor.)						
Hilbert, Frank J. (See Carter, John T., assignor.)						
Hilderbrand, Edward L., H. Rost, and C. L. Davis, Sullivan, Ind. Draft-spring	405,162	June 11	1152	[illegible]	47	1460

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Hutchinson, Mary E. (See Hutchinson, William F., assignor.)						
Hutchinson, William F., assignor to M. E. Hutchinson, Lynn, Mass. Toothpick-machine	404,282	May 28	2632	683	47	1190
Hutchinson, William N., Silverdale, Eastbourne, county of Sussex, England. Rotary engine	402,834	May 7	422	111	47	742
Hutchison, Andrew C., *et al.* (See Smith, Wilson R., assignor.)						
Hutson, Ezra, Fairport, N. Y. Wire-fence machine	405,094	June 11	1049	280	47	1440
Hutton, George H., Baltimore, Md. Thill-coupling	402,527	Apr. 30	3209	831	47	646
Hutton, George H., Baltimore, Md. Jump-seat for vehicles	405,557	June 18	1767	466	47	1591
Huyett, Cecelia E., *et al.* (See Huyett, Miles C., assignor.)						
Huyett, Miles C., assignor, by mesne assignments, to C. E. Huyett and A. C. Roller, Detroit, Mich. Car-window ventilator	405,312	June 18	1387	365	47	1513
Hyams, Rachel B. (See Marks, Solomon, assignor.)						
Hyatt, Charles M., assignor to Embossing Company, Albany, N. Y. Domino	405,164	June 11	1155	308	47	1461
Hyatt, Henry A. (See Kuhn, Henry, assignor.)						
Hyatt, John W., Newark, N. J. Valve mechanism for washing filter-beds	402,738	May 7	276	71	47	715
Hyatt, John W., Newark, N. J. Apparatus for filtering	404,708	June 4	492	125	47	1321
Hyatt, John W., Newark, N. J. Strainer for granular filter-beds	404,911	June 11	793	{202 203	47	1388
Hyatt, John W., Newark, N. J., assignor to Hyatt Pure Water Company, of New Jersey. Check-valve for filter constructions	405,670	June 18	1959	514	47	1626
Hyatt Pure Water Company. (See Hyatt, John W., assignor.)						
Hyde, Elwin R., Springfield, Mass. Driving and belt-shifting mechanism	404,709	June 4	494	126	47	1321
Hyde, Elwin R., Springfield, Mass. Surface grinding or planing machine	405,706	June 25	2016	{529 530	47	1643
Hyde, Elwin R., and R. C. Horner, Springfield, Mass. Surface-grinding machine	401,278	Apr. 9	1280	{341 342	47	251
Hyde, Fred W., and A. Z. Dotterer, Davisville, Cal. Gate	404,973	June 11	884	231	47	1406
Hydraulic Elevator Company. (See Foster, Charles E., assignor.)						
Ide, Albert L., Springfield, Ill. Lubricating device for steam-engines	400,682	Apr. 2	369	100	47	73
Ide, Samuel, Medina, N. Y. Lathe-chuck	400,459	Apr. 2	48	15	47	13
Illingsworth, James B., Monroe, La. Machine for setting car-springs	404,069	May 28	2396	610	47	1134
Illingworth, George C., Raritan, N. J. Nut-lock	402,739	May 7	279	72	47	716
Illingworth, John, Newark, N. J. Apparatus for casting ingots	403,755	May 21	1812	476	47	1024
Imandt, Christian, New York, N. Y. Refinishing curtains	404,543	June 4	276	.....	47	1277
India Rubber Comb Company. (See Schlesinger, Augustus D., assignor.)						
Ingersoll, Mary, Erie, Pa. Check-hook for harness	403,351	May 14	1214	322	47	901
Ingersoll-Sergeant Rock Drill Company. (See Sergeant, Henry C., assignor.)						
Ingram, Frederick F., Detroit, Mich. Bag-lock	405,357	June 18	1446	383	47	1525
Ingram, James, Lawrence, Mass. Chain	403,591	May 21	1577	417	47	978
Inman, Charles B., Leeds, county of York, England. Bottle washing and brushing machine	401,561	Apr. 16	1713	{451 452	47	344
Insley, Robert, Bateham, Kans. Cultivator	402,247	Apr. 30	2772	717	47	564
International Gas and Fuel Company. (See Wright, Walter B., assignor.)						
International Portelectric Company. (See Williams, John T., assignor.)						
Interstate Fire Alarm Company. (See Ruddick, John J., assignor.)						
Ireland, David M. (See Matthews and Ireland.)						
Iron Car Company. (See Goodfellow, James T., assignor.)						
Ironmonger, Henry W., *et al.* (See Kieser, Charles, assignor.)						
Irvine, Samuel. (See Palm and Smith, assignors.)						
Irving, Mark E., assignor of two-thirds to C. S. Dyer and J. Heffron, Detroit, Mich. Boiler	404,912	June 11	796	{203 204	47	1388
Irwin, Charles H., Wilmington, Ohio. Auger-bit	404,197	May 28	2495	652	47	1166
Irwin, George M. (See Rhoads, Jonathan A., assignor.)						
Iten, John J., Davenport, Iowa. Machine for imparting motion	401,168	Apr. 9	1118	296	47	220
Iusti, Johann A. W., assignor to himself and C. Kerrison, Jr., Charleston, S. C. Vegetable-cutter	402,740	May 7	280	73	47	716
Ivans, Thomas J., New York, N. Y. Pump	402,835	May 7	423	{111 112	47	742
Iversen, Ole, Anoka, Minn. Window-ventilator	405,373	June 18	1388	366	47	1513
Ives & Co., Hobart B. (See Smith, Thomas S., assignor.)						
Ivory, James W., Philadelphia, Pa. Dental rubber-dam clamp	400,771	Apr. 2	497	135	47	97
Ivory, James W., Philadelphia, Pa. Dredge-box	401,651	Apr. 16	1573	486	47	373
Iwanowski, Armand C., Moscow, Russia. Thermal circuit-closer for fire-alarms	400,917	Apr. 9	739	199	47	151
Jachmann, William, New York, N. Y. Dumping-wagon	401,437	Apr. 16	1523	403	47	311
Jackson, Peter H., San Francisco, Cal. Support for beams or girders	405,358	June 18	1448	383	47	1525
Jackson, Peter H., San Francisco, Cal. Frame for illuminating-tiles	405,778	June 25	2120	557	47	1663
Jackson, Thomas B., Belmont, Ohio. Fire-place heater	405,707	June 25	2019	530	47	1643
Jackson, Walter M., New York, N. Y. Forming gas-outlets	400,683	Apr. 2	372	101	47	74
Jackson, Walter M., New York, N. Y. Burner tip or pillar	403,592	May 21	1578	417	47	978
Jacob, Bertha, New York, N. Y. Window-chair	404,355	May 28	2744	712	47	1211
Jacobs, Jacob, New York, N. Y. Illuminating-tile	402,930	May 7	557	{146 147	47	767
Jacobs, Jacob, New York, N. Y. Illuminating-tile	402,931	May 7	558	147	47	768
Jacobs, John W., deceased, Fremont, Ohio; J. T. Garver administrator. Feed-box	405,260	June 18	1313	346	47	1498
Jacobs, William J., Bargersville, Ind. Shock-loading machine	405,840	June 25	2202	579	47	1679
Jacobson, Kate E., *et al.* (See Langston, Thomas, assignor.)						
Jacoby, Max B. (See Straus and Jacoby.)						
Jacques, William W., Newton, Mass., assignor to Edison Phonograph Toy Manufacturing Company, of Maine. Phonograph-doll	400,851	Apr. 2	635	172	47	122
Jaffray, David S., Chicago, Ill. Horseshoe	400,684	Apr. 2	373	101	47	74
Jagger, Jehiel W. (See Greenwald, Herman D., assignor.)						
Jagger, Joseph, Glenham, N. Y. Loom	403,194	May 14	964	{253 254	47	854
James, George. (See Heckel and James.)						
James, John, and A. D. Goodenough, Henrietta, Tex. Shackle	404,544	June 4	276	66	47	1277
James, Lucy J., Pomona, Cal. Corset	405,037	June 11	979	260	47	1426
James, William P., Lincolnton, N. C. Spring-back for stools or chairs	404,628	June 4	392	94	47	1300
Jameson, Charles B., assignor to Bodine Roofing Company, Mansfield, Ohio. Wood-pulp-board-bending machine	401,353	Apr. 16	1396	370	47	287
Jameson, Samuel G., and E. A. Baird, Washington Court-House, Ohio. Gate	404,283	May 28	2633	683	47	1190
Jamieson, Augustus, Elizabeth, N. J. Secondary battery	403,593	May 21	1579	{417 418	47	978
Janes, Henry, Waterbury, Vt. Reed-organ	405,708	June 25	2020	530	47	1643
Janke, Henry S., Dayton, Ohio. Folded paper bucket	403,504	May 21	1580	418	47	978

Johnson, John, Brooklyn, N. Y. Filter-press	402,455	Apr. 30	3099	804	47	626
Johnson, John A., Madison, Wis. Axle-skein	400,685	Apr. 2	374	101	47	74
Johnson, John B., St. Louis, Mo. Conduit-yoke for cable-ways	402,741	May 7	281	72	47	716
Johnson, John R., *et al.* (See Price, George W., assignor.)						
Johnson, Jonathan, assignor to himself and E. H. Packer, Lowell, Mass. Heating apparatus	403,474	May 14	1407	368	47	936
Johnson, Laura H. (See Pearce, Annie W., assignor.)						
Johnson, Louis K., Brooklyn, N. Y. Sash-fastener	405,095	June 11	1050	280	47	1441
Johnson, Milbank. (See Johnson, Gail B. and M.)						
Johnson, Robert W., New Brunswick, N. J. Flexible receptacle for ligatures	404,843	June 11	690	178	47	1369
Johnson Steel Street Rail Company. (See Brown, William M., assignor.)						
Johnson Steel Street Rail Company. (See Colley, Frederick, assignor.)						
Johnson, Victor D., Mount Pleasant, Iowa. Sled	402,019	Apr. 23	2423	631	47	488
Johnson, William D., Seymour, Ind. Wooden dish	403,111	May 14	833	230	47	838
Johnson, William W., Palmyra, Nebr. Sample-holder and box-pull	403,535	May 21	1510	396	47	964
Johnston, Charles W., Louisville, Ky. Ink-eraser	403,674	May 21	1683	448	47	1002
Johnston, George, San Francisco, Cal. Ore-feeder	401,634	Apr. 9	913	244	47	183

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Dr'g.	Official Gazette. Vol.	Page.
Johnston, James J., Columbiana, Ohio, assignor to H. M. Myers, Beaver Falls, Pa. Bar for the manufacture of shovel-blanks	405,415	June 18	1533	406	47	1543
Johnston, James J., Columbiana, Ohio, assignor to H. M. Myers, Beaver Falls, Pa. Making shovel-blanks	405,416	June 18	1533	406	47	1543
Johnston, John, Neenah, Wis. Flour-bolt	403,675	May 21	1693	441	47	1002
Johnston, John, Neenah, Wis. Flour-bolt	403,757	May 21	1816	477	47	1025
Johnston, William J. (See McCalmont, Hiram R., assignor.)						
Johnstone, Alice, Avondale, N. J. Combined button-hook and bracelet	401,746	Apr. 23	2016	527	47	412
Johnstone, William H. (See Warde, George H., assignor.)						
Jolly, Thomas J., Ulysses, Nebr. Device for opening trap-doors	402,932	May 7	559	147	47	768
Joly Stopper Company. (See Lloyd, Edwin L., assignor.)						
Joly Stopper Company. (See Rehfuss, George, J G., and M. O., assignors.)						
Jones, Albert F., Salem, Mass. Boiler-feeder	404,629	June 4	393	95	47	1300
Jones, Alfred W., *et al.* (See Hatch, Adin A., assignor.)						
Jones, Augustus H., Meriden, Conn. Drawer-pull	400,852	Apr. 2	636	179	47	122
Jones, Benjamin F., *et al.* (See Hatch, Adin A., assignor.)						
Jones, Charles R., Hatley, Quebec, Canada. Thill-coupling	401,170	Apr. 9	1122	297	47	220
Jones, Charles W., London, Ontario, Canada. Belt-tightener	403,048	May 7	720	188	47	799
Jones, Edmund C., assignor of one-half to W. J. Gleason, San Francisco, Cal. Coin-actuated receptacle	405,215	June 11	1238	329	47	1476
Jones, Edward L., Dover, Del. Machine for applying heads to tin cans	400,853	Apr. 2	637	173	47	122
Jones, George R. G., Louisville, Ky. Inkstand	402,817	May 7	425	112	47	743
Jones, George W., Philadelphia, Pa. Car-wheel axle	401,280	Apr. 9	1223	342	47	251
Jones, Harry. (See Frid, Edward, assignor.)						
Jones, Henry M., Denver, Colo. Combined sleeping and day car	401,438	Apr. 16	1525	403, 404	47	311
Jones, Henry P., New York, N. Y. Diaphragm for acoustic telephones	405,483	June 18	1651	435	47	1566
Jones, Henry R., *et al.* (See Randel, Zadock, assignors.)						
Jones, James H., assignor to Emerson, Talcott & Company, Rockford, Ill. Mower	405,238	June 11	1272	336	47	1462
Jones, John T. (See Schinneller and Jones.)						
Jones, John T., Iron Mountain, Mich. Spike-blank bar	403,049	May 7	721	188	47	800
Jones, Lewis. (See Ballou, Hiram P., assignor.)						
Jones, Richard B. (See Wetherell and Jones.)						
Jones, Richard W., Syracuse, N. Y. Overdraw or checkrein attachment	402,456	Apr. 30	3100	804	47	626
Jones, Walter F., Parish, assignor of one-half to C. W. Bardeen, Syracuse, N. Y. Blackboard-eraser	405,006	June 11	1051	281	47	1441
Jones, William R., Braddock, Pa. Mixing molten pig metal	404,414	June 4	57	15	47	1247
Jones, William R., Braddock, Pa. Apparatus for mixing molten pig metal	404,415	June 4	60	16	47	1247
Jones, Willis C. (See Rogers and Jones.)						
Jonson, Julius, assignor of one-half to J. Elson, New York, N. Y. Engine	402,086	Apr. 23	2528	659	47	508
Jorgensen, Axel, Des Moines, Iowa. Compressed-air motor	402,838	May 7	426	112, 113	47	743
Joseph, Isidora. (See Rohrer and Joseph.)						
Joseph, Myer, Cambridge, Mass. Game apparatus	405,314	June 18	1389	366	47	1513
Joslin, Isaac R., and G. T. Lawrence, New York, N. Y. Wood-working tool	404,489	June 4	180	42	47	1252
Joslin, William, Cleveland, Ohio. Car-wheel	405,710	June 25	2023	532	47	1644
Joyce, Joseph L., New Haven, Conn. Rubber boot or shoe	404,416	June 4	62	16	47	1237
Judd, James L. (See Wiard and Judd.)						
Judkins, Mark D., Osakis, Minn. Monument	402,528	Apr. 30	3210	831, 832	47	646
Judson Pneumatic Railway Company. (See Judson, Whitcomb L., assignor.)						
Judson, Whitcomb L., assignor to Judson Pneumatic Railway Company, Minneapolis, Minn. Mechanical movement	402,674	May 7	181	46	47	698
Judson, Whitcomb L., assignor to Judson Pneumatic Railway Company, Minneapolis, Minn. Conduit for driving mechanism of street-railways	402,839	May 7	428	113	47	743
Judson, Whitcomb L., assignor to Judson Pneumatic Railway Company, Minneapolis, Minn. Street-railway	402,933	May 7	560	148	47	768
Judson, Whitcomb L., assignor to Judson Pneumatic Railway Company, Minneapolis, Minn. Street-railway	402,934	May 7	563	148, 149	47	769
Julier, Camilla, and J. O. Robinson, assignors of one-third to H. D. Miller, Hanging Rock, Ohio. Oven-thermometer	400,573	Apr. 2	211	57	47	45
Jump, Samuel, San Francisco, Cal. Tensile-strain-testing machine	404,200	May 28	2499	653	47	1167
Junghans, Arthur, Schramberg, Würtemberg, Germany. Clock	401,499	Apr. 16	1616	428	47	329
Junkins, Leander D., Somerville, Mass. Tack-feeding machine	403,843	May 21	1950	512	47	1051
Juruick, Max. (See Ford and Juruick.)						
Kadow, William, Jr., Newark, N. J. Sash-balance	405,711	June 25	2025	532	47	1644
Kaehler, Otto, Philadelphia, Pa. Muff	405,097	June 11	1052	281	47	1441
Kaffeman, Frederick, New York, N. Y. Ring	401,112	May 14	833	220	47	898
Kahn, Lazard, Hamilton, Ohio. Burner for gas-stoves	401,783	Apr. 23	2066	540	47	422
Kaiser, John, Seneca Falls, N. Y. Hydrant	401,652	Apr. 16	1873	487	47	373
Kakas, William F. (See Bradford, Charles K., assignor.)						
Kampf, Ferdinand, Chemnitz, Germany. Receptacle for pulverized substances	400,686	Apr 2	375	101	47	74
Kampfe, Frederick, R., and O., Brooklyn, N. Y. Razor-stropping device	405,961	June 25	2392	627	47	1712
Kampfe, Otto. (See Kampfe, Frederick, R., and O.)						
Kampfe, Richard. (See Kampfe, Frederick, R., and O.)						
Kane, Frank H., Riverside, assignor to Cincinnati Cooperage Company, Cincinnati, Ohio. Stave-dressing machine	403,596	May 21	1582	419	47	979
Kanitzer, William, *et al.* (See Murphy, William H., assignor.)						
Kannenberg, Alvin C., Canton, Ohio. Sheet-metal roofing	403,844	May 21	1951	512	47	1051
Kanonse, John G. (See Miller and Kanonse.)						
Kappe, William J. H., Quincy, Ill. Baling-press	401,171	Apr. 9	1124	297, 298	47	221
Karo, King L., Washington, D C. Follower for trunks or packing-boxes	401,439	Apr. 16	1528	404	47	311
Karrer, Frank, Rich Hill, Mo. Car-coupling	405,360	June 18	1450	384	47	1526
Karrer, Simon C. (See Blankart, John, assignor.)						
Kaselowsky, Emil, assignor to Berliner Maschinenbau-Actien-Gesellschaft, vormals L. Schwartzkopff, Berlin, Germany. Electrical night-signaling apparatus	401,035	Apr. 9	914	244	47	183
Kaspar, John A., Jr., Pomeroy, Ohio. Yarn-reel	405,560	June 18	1770	467	47	1592
Katherman, Charles W., and R. Folk, Williamsport, Pa. Bureau or similar article of manufacture	405,166	June 11	1157	309	47	1461
	401,562	Apr. 16	1715	452	47	345
Kauble, Stephen, Clay City, Ill. Plow	402,331	Apr. 30	2898	751	47	588
Kaufmann, Michael, Greenwich, county of Kent, England. Revolving fire-arm	401,653	Apr. 16	1875	487	47	373
Kaufmann, Robert, Cincinnati, Ohio. Display-rack	402,840	May 7	429	113	47	744
Kaylor, John, assignor to G. W. Lehman and A. O. Bolen, Decatur, Ill. Can-opener						

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Dr'g.	Official Gazette. Vol.	Page.
Kayser, William J., Milwaukee, Wis. Ash-sifter	403,272	May 14	1098	290	47	878
Keasey Pulley Company. (See Clark and Keasey, assignors.)						
Keasey, Theron D. (See Clark and Keasey.)						
Keator, Charles E., Brooklyn, N. Y. Making hat-sweats	405,417	June 18	1534	406	47	1543
Keator, Charles E., assignor to Paland Hat Machine Company, Brooklyn, N. Y. Bottom board for hats	400,773	Apr. 2	500	135, 136	47	98

La Grange, Clinton, Guilderland Centre, N. Y. Mowing-machine	403,679	May 21	1701	450	47	1003
La Mothe, Bernard J., assignor to United States Rolling Stock Company, New York, N. Y. Car-truck	402,167	Apr. 30	2662	689	47	543
La Mothe, Bernard J., assignor to United States Rolling Stock Company, New York, N. Y. Railway-car truck	402,168	Apr. 30	2663	690	47	543
La Mothe, Bernard J., assignor to United States Rolling Stock Company, New York, N. Y. Car-truck	402,169	Apr. 30	2665	690	47	543
La Rue, Roland M., assignor of one-half to W. Newkirk, Connersville, Ind. Railway-car heater	401,749	Apr. 23	2019	528	47	412
Laass, Emil, *et al.* (See Dewey, Mark W., assignor.)						
Lacey, Fred, assignor of one-half to A. B. Mole, Adams, Mass. Loom attachment for weaving center selvages	403,196	May 14	971	255 / 256	47	855
Lacey, John F., Domestic, Ind. Post-hole-boring machine	402,941	May 7	574	151	47	772
Lacroix, Charles. (See Ostermann and Lacroix.)						
Ladd, Daniel E., Schenectady, N. Y. Folding gate	404,007	May 28	2184	574	47	1104
Ladd, Joseph J., Callao, Peru. Replacing-frog	404,095	May 28	2335	612	47	1135
Ladd, Sherman W. (See Gooding and Ladd.)						
Laemmle, David, Fort Wayne, Ind. Brick-kiln	400,575	Apr. 2	213	58	47	45
Lafloe, Edward, Willimantic, Conn., assignor of one-half to T. B. Stowell, Providence, R. I. Top roll for spinning-machines	403,537	May 21	1512	396	47	965
Laguire, William H., Amber, Mich. Die-stock	402,747	May 7	290	74	47	718
Lahey, William, Stoneham, Mass. Belt-tightener for sole-edge-trimming machines	402,250	Apr. 30	2775	718	47	564
Lahman, William H., Chicago, Ill. Grate for furnaces	401,955	Apr. 23	2396	604	47	470
Lahousse & Co., Hector. (See Collé, Charles, assignor.)						
Lahue, Moses M. (See Sawyer and Lahue.)						
Lake, Wilmot, Washington, D. C. Coupling for underground conduits	403,352	May 14	1215	323	47	901
Lalonde, Joseph, Essexville, Mich. Ditching-machine	400,859	Apr. 2	645	175	47	124
Lambert, Albert, Wadsworth, Ohio. Steam-injector	401,565	Apr. 16	1718	453	47	345
Lambert, Clement. (See Weber and Lambert.)						
Lambert, George W. (See Dunham, Sylvester C., assignor.)						
Lambert, Homer. (See Berry and Lambert.)						
Lambing, Isaac P., Ione, Cal. Excavator	403,702	May 21	1823	478 / 479	47	1026
Lambing, John S. (See Bonnell and Lambing.)						
Lamont, John, assignor to Tower & Lamont, Rochester, N. Y. Razor-strop	402,461	Apr. 30	3111	807	47	628
Lamson Consolidated Store Service Company. (See Cowley, James T., assignor.)						
Lamson, William S. (See Eichbaum, Henry, assignor.)						
Lamson, William S. (See Soper, Samuel H., Jr., assignor.)						
Lancaster, Frederick J., assignor to National Weighing Machine Company, New York, N. Y. Coin-controlled weighing-machine	402,748	May 7	291	75	47	718
Lancaster, Hashemann. (See Replogle and Lancaster.)						
Land, Charles H., Detroit, Mich. Artificial tooth	400,921	Apr. 9	744	200	47	152
Land, Charles H., Detroit, Mich. Artificial tooth-crown	403,507	May 21	1583	419	47	979
Land, Charles H., Detroit, Mich. Artificial tooth-crown	405,167	June 11	1158	309	47	1461
Landers, John F. (See Parker and Landers.)						
Landes, Adolph, assignor, by mesne assignments, to S. Landes, New York, N. Y. Neck-scarf	403,538	May 21	1514	396	47	965

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Landes, Sophie. (See Landes, Adolph, assignor.)						
Landis, Frank F., Waynesborough, Pa. Threshing-machine	401,840	Apr. 23	2153	562	47	437
Landis, Frank F., Waynesborough, Pa. Hinge-screw coupling for fishing-net frames	403,680	May 21	1702	450	47	1004
Landman, John G., Brooklyn, N. Y. Hinge-screw coupling for fishing-net frames	405,894	June 25	2280	599	47	1693
Landolt, Christian, Louisville, Ky. Bronzing-machine	403,274	May 14	1103	293	47	879
Lane, Almeron M., Meriden, Conn. Setting mechanism for alarm-clocks	403,275	May 14	1104	293	47	879
Lane, Almeron M., Meriden, Conn. Clock striking mechanism	402,334	Apr. 30	2002	758	47	588
Lane, Arthur E., Chicago, Ill. Guard for infants						
Lane & Co., William R. (See Knight, George H., assignor.)						
Lane, Cyrus D., *et al.* (See Green, William W., assignor.)						
Lane, Frank A., Manchester, N. H. Pipe-joint	402,089	Apr. 23	2333	660	47	509
Lane, Frank A., Asbury Park, N. J. Arc lamp	400,692	Apr. 2	382	103	47	75
Lane, George M., Asbury Park, N. J. Arc lamp	405,421	June 18	1540	408	47	1544
Lane, James W., New York, N. Y. Water-proof material for coats	402,843	May 7	432	114	47	744
Lane, John G., Poughkeepsie, N. Y. Door-hanger track	406,000	June 25	2464	645	47	1734
Lane, William J., Poughkeepsie, N. Y. Tackle-block	401,956	Apr. 23	2327	604	47	470
Laney, William S., Lithopolis, Ohio. Washing-machine						
Lang Company, William. (See Hertel, Henry, assignor.)						
Lang, Henry. (See Glocker, Carl F., assignor.)						
Lang, Louis P., Allegheny, Pa. Boot or shoe sole protector	403,681	May 21	1704	450	47	1004
Lang & Shepard. (See Shepard, Stephen A., assignor.)						
Lang, William, Brooklyn, N. Y. Vending apparatus	401,891	Apr. 23	2298	581	47	452
Langan, John B., Chicago, Ill. Confection-box	402,942	May 7	575	151	47	772
Lange, Christian F., Cleveland, Ohio. Damper	403,353	May 14	1215	323	47	901
Lange, Philip. (See Reinmann and Lange.)						
Langebartels, Henry C., Star, Iowa. Road-scraper	401,356	Apr. 16	1403	371	47	288
Langenbach, Charles J., Dorchester, Iowa, assignor of one-half to J. F. Force, Minneapolis, Minn. Bolt	403,847	May 21	1955	513	47	1032
Langer, Gustav E. (See Fritsch, Anton H., assignor.)						
Langill, Ross B., River John, Nova Scotia, Canada. Tire-shrinker	403,115	May 14	837	221	47	829
Langlands, Daniel G., and O. E. Moulton, assignors to Somersworth Machine Company, Dover, N. H. Machine for tapping elbows and return-bends	403,199	May 14	972	256 / 257	47	855
Langston, Thomas, Meriden, Conn., assignor to E. H. Fessenden and K. E. Jacobson, Brooklyn, N. Y. Wick-tube for lamps	404,848	June 11	698	180	47	1370
Lansell, George, Sandhurst, Victoria. Apparatus for equalizing the strain on winding-gear	404,292	May 28	2645	687 / 688	47	1193
Lapage, Richard H., Westminster, England. Compound engine	405,569	June 18	1780	471	47	1594
Lapage, Richard H., Westminster, England. Compound locomotive-engine	405,570	June 18	1784	472 / 473	47	1595
Lapp, John. (See Locke and Lapp.)						
Lapworth, William, Hopedale, Mass. Boot or shoe	402,943	May 7	576	151	47	772
Lapworth, William, assignor to Hopedale Elastic Fabric Company, Hopedale, Mass. Corded or elastic fabric	402,844	May 7	433	114	47	744
Larimer, William S., Glen Ebon, Ohio. Hinge	401,036	Apr. 9	916	245	47	184
Larkins, George. (See Caird and Larkins.)						
Larson, Adolph, Mapleton, Wis. Device for transmitting power	403,598	May 21	1585	420	47	979
Larson, Emil. (See Hammarlund and Larson.)						
Larson, Henry A., Hawthorne, Iowa. End-gate for wagons	402,944	May 7	576	152	47	772
Lasack, Adolph, Oxford Junction, Iowa. Hay-loader	404,096	May 28	2336	612 / 613	47	1136
Lasor, Elizabeth S., administratrix. (See Lasor, Sanford W.)						
Lasor, Sanford W., deceased; E. S. Lasor administratrix and assignor to C. Chambers, Jr., Philadelphia, Pa. Wire cut-off brick-machine	401,750	Apr. 23	2021	528	47	413
Latch, Arthur. (See Batchelor and Latch.)						
Lathrop, Augustus, and L. A. Heard, Maybell, Colo. Water-elevator	404,849	June 11	699	180	47	1371
Lathrop, William C., Milton Centre, Ohio. Grain-drill attachment	402,677	May 7	185	47	47	699
Lathrop, William C., Milton Centre, Ohio. Fence	402,678	May 7	187	47	47	699
Latill, Louis, Baton Rouge, La. Hame-tug	401,957	Apr. 23	2328	605	47	470
Latschar, Christian, New Brunswick, N. J. Work-box	401,037	Apr. 9	917	245	47	184
Lattan, Louis. (See Tripp and Lattan.)						
Lanfenburg, Michael N., assignor to Stockton Combined Harvester and Agricultural Works, Stockton, Cal. Grain separator and cleaner	402,462	Apr. 30	3112	807 / 808	47	628
Laughlin, John W., Parkville, Ill. Device for handling green tiles	403,276	May 14	1165	293	47	880
Laughlin, Thomas S., Portland, Me. Folding anchor	401,654	Apr. 16	1875	487	47	373
Laven, Matthias, *et al.* (See Murphy, William H., assignor.)						
Lavery, Richard, Boston, Mass. Differential gearing for hoisting-machines	402,601	May 7	73	17	47	678
Lavigne, Joseph P., New Haven, Conn. Breech-loading ordnance	405,844	June 25	2207	581	47	1680
Law, Crossley, and C. E. Howe, South Chicago, assignors of one-tenth to E. Ward, Chicago, Ill. Apparatus for the manufacture of steel	405,422	June 18	1541	408 / 409	47	1544
Law, Myron D., Philadelphia, Pa. Lightning-arrester	400,463	Apr. 2	52	16	47	14
Lawrence, Adelbert G., Motley, Minn. Pulley-support	402,251	Apr. 30	2776	718	47	564
Lawrence, Adelbert G., Motley, Minn. Automatic switch	402,252	Apr. 30	2777	719	47	565
Lawrence, Cyrenius, Clyde, Mich. Crib	400,693	Apr. 2	383	103	47	76
Lawrence, Edwin F., *et al.* (See Clark, Norman, assignor.)						
Lawrence, George T. (See Joslin and Lawrence.)						
Lawrence, James W., New York, N. Y. Buckboard	400,576	Apr. 2	214	58	47	45
Lawrence, John H., *et al.* (See Clark, Norman, assignor.)						
Lawrence, John R. (See Patterson and Lawrence.)						
Lawrence, Louis P., Passaic, N. J., assignor to Lawrence Railway Brake Company, New York, N. Y. Locomotive-brake	403,277	May 14	1107	293 / 294	47	880
Lawrence, Louis P., Passaic, N. J., assignor to Lawrence Railway Brake Company, New York, N. Y. Power-brake	403,539	May 21	1514	397	47	965
Lawrence Railway Brake Company. (See Lawrence, Louis P., assignor.)						
Lawshe, Spencer R., Chicago, Ill. Lightning-rod and coupling	400,464	Apr. 2	54	16	47	14
Lawson, Albert. (See Lawson, Henry and A.)						
Lawson, Arthur T., and S. Dear, Leeds, county of York, England. Tension-regulating device for spindle-driving bands	404,917	June 11	801	205 / 206	47	1390
Lawson, Henry and A., Baltimore, Md. Steering apparatus	404,008	May 28	2185	574	47	1105
Lawson, P. V., and W. L. Field, Menasha, Wis. Pulley	403,116	May 14	838	222	47	829
Lawson, Samuel, assignor to himself and A. T. Welch, New York, N. Y. Gas-engine	402,749	May 7	293	75	47	718
Lawson, Samuel, assignor to himself and A. T. Welch, New York, N. Y. Gas-engine	402,750	May 7	295	76	47	718
Lawson, Samuel, assignor to himself and A. T. Welch, New York, N. Y. Gas-engine	402,751	May 7	297	76	47	719
Lawton, Lewis, F. Swann, and W. R. Whitehead, Chambersburg, N. J.; said Lawton assignor to said Swann and Whitehead. Muffle for glass and earthen ware	405,571	June 18	1786	473	47	1596
Lawton, Lyman T., assignor to Meriden Malleable Iron Company, Meriden, Conn. Lamp-wick lifter	402,945	May 7	577	152	47	773

Laycock, William S., Sheffield, county of York, England. Brake for railway-wagons	403,540	May 21	1515	397	47	985
Layman, Stephen D., Boston, Mass. Perforating-machine	401,038	Apr. 9	919	245	47	184
Le Beau, Frederick, Buffalo, N. Y. Water-wheel	401,751	Apr. 23	2023	529	47	413
Le Clair, George, assignor to Le Clair Manufacturing Company, Oswego, N. Y. Automatic safety-clutch	405,845	June 25	2209	581	47	1689
Le Clair Manufacturing Company. (See Le Clair, George, assignor.)						
Lea, James, Fernleigh, New Road, Bromagrove, county of Worcester, England. Seat for vehicles	401,179	Apr. 9	1134	300	47	222
Leach, Henry B., Boston, Mass. Safety-razor	402,463	Apr. 30	3114	808	47	628
Leach, Henry B., Boston, Mass. Safety-razor	402,946	May 7	578	152	47	773
Leach, Willis E. (See Briggs and Leach.)						
Leak, William W., Montgomery, Ala. Plow	402,253	Apr. 30	2780	719	47	565
Learned, William B., and L. Murray, assignors of one-half to E. Howard Watch and Clock Company, Boston, Mass. Pinion-facing machine	401,180	Apr. 9	1135	301	47	222
Leary, Michael, assignor of one-half to J. P. Mann, Utica, N. Y. Automatic railway-frog	405,965	June 25	2402	629	47	1713
Lesaer, Joseph, Wheaton, Minn. Grain-cleaning machine	405,168	June 11	1160	310	47	1461
Leavell, James M. (See Huffman, William C., assignor.)						
Leavis, Henry T., assignor to Wakefield Rattan Company, Wakefield, Mass. Reed or rattan chair, &c	401,958	Apr. 23	2329	605	47	471
Leavitt, Erasmus D., Jr., Cambridgeport, Mass. Steam-engine	402,254	Apr. 30	2780	720	47	566
Leavitt, Erasmus D., Jr., Cambridgeport, Mass. Device for connecting the cranks of two independently-acting engines	402,255	Apr. 30	2782	721	47	566
Leavitt, Erasmus D., Jr., Cambridgeport, Mass. Steam-cylinder for steam-engines	402,256	Apr. 30	2783	721	47	566
Leavitt, Erasmus D., Jr., Cambridgeport, Mass. Hoisting-engine	402,257	Apr. 30	2784	721, 722	47	566
Leavitt, Frank M., assignor to E. W. Bliss Company, Brooklyn, N. Y. Drop-hammer	401,566	Apr. 16	1719	453, 454	47	346
Leavitt, Frank M., Brooklyn, N. Y., assignor, by mesne assignments, to Opera Glass Supply Company, of New Jersey. Coin-operated lock	403,200	May 14	975	257, 258	47	856
Lebel, Florian, Levis, Quebec, Canada. Carriage-axle	404,635	June 4	400	97	47	1302
Lebowich, Hyman. (See Block, Hyman I., assignor.)						
Leck, John O., Glen Elder, Kans. Vehicle-wheel	403,763	May 21	1826	479	47	1027
Leclercq, Louis P., Lille, France. Merchandise wrapper or envelope	402,335	Apr. 30	2903	752	47	588
Leduc, Nelson, and A. E. Weeks, Lockport, N. Y.; said Weeks assignor to said Leduc. Dust-collector	401,503	Apr. 16	1621	429	47	329
Lee, Charles. (See Whittlesey, Charles E., assignor.)						
Lee, Elmer, St. Louis, Mo. Surgical applicator	401,787	Apr. 23	2072	541	47	423
Lee, George W., Homeworth, Ohio, assignor to himself and H. T. Gould, Perry, N. Y. Thill-coupling	402,531	Apr. 30	3213	832	47	647
Lee, Henry A., Glen Ridge, N. J. Package for merchandise	405,364	June 18	1456	385	47	1527
Lee, Joseph P., Wyalusing, Pa. Hoof-shears	401,892	Apr. 23	2229	581	47	459
Lee, Willard, Los Gatos, Cal. Machine for labeling cans	401,039	Apr. 9	920	246	47	184
Lee, William H. (See Patton, George W., assignor.)						
Lee, William W., Northampton, Mass. Handle for table-cutlery	401,181	Apr. 9	1137	301	47	223
Lee, William W., Northampton, Mass. Welding	402,947	May 7	579	.....	47	773
Leeds, Pulaski, Louisville, assignor to R. T. Miller, Covington, Ky. Drill	402,170	Apr. 30	2666	691	47	544
Leedy, John W., *et al.* (See Davis, Jehu W., assignor.)						
Leeper, Alfred B., Owaneco, Ill. Band-cutter platform for thrashing-machines	402,258	Apr. 30	2789	722	47	567
Leeper, George W., *et al.* (See Huffman, Pleasant B., assignor.)						
Leeper, Henry S., *et al.* (See Huffman, Pleasant B., assignor.)						
Lees, Ralph. (See Stead, Eldred W., assignor.)						
Leesintzer, George W. (See Taylor, William A., assignor.)						
Lefébure, Etienne L., New York, N. Y. Scraper	401,442	Apr. 16	1531	405	47	312
Leffingwell, John Q., Nevada, Iowa. Washing-machine	401,357	Apr. 16	1404	371, 372	47	288
Legat, Désiré M., Paris, France. Flexible piping for air-brakes	401,706	Apr. 16	1943	507	47	386
Leggett, Clinton H., New York, N. Y. Cover for paint-cans	402,679	May 7	188	47, 48	47	699
Lehman, Edwin W., Philadelphia, Pa., assignor of one-half to D. C. Walker, Edgewater, N. J. Hand-stamp	400,860	Apr. 2	647	175	47	124
Lehman, George W., *et al.* (See Kaylor, John, assignor.)						
Lehman, Joseph H., Philadelphia, Pa. Electric gas-lighter	403,944	May 28	2092	548	47	1086
Lehman, Joseph N. and N., Goshen, Ind. Wire fence	401,567	Apr. 16	1725	454	47	347
Lehman, Neal. (See Lehman, Joseph N. and N.)						
Lehmann, Anthony A., Baltimore, Md. Stop-motion for doubling-machines, &c	400,694	Apr. 2	384	104	47	76
Leibel, Joseph C., assignor of one-half to D. Ashby, Colorado Springs, Colo. Scarf-pin	405,783	June 25	2127	553	47	1664
Leibersperger, George R., and G. W. Bailey, Saegerstown, Pa. Fan for rocking-chairs	402,948	May 7	579	152, 153	47	773
Leiby, Isaac F., Baird, Tex. Nut-lock	402,023	Apr. 23	2427	632	47	488
Leighton, George W., assignor to Dalzell, Gilmore & Leighton Company, Findlay, Ohio. Manufacture of glassware	402,090	Apr. 23	2534	.....	47	510
Leighton, John T., Edinburgh, Scotland. Apparatus for manufacturing aerated water	403,117	May 14	839	222	47	829
Leilich, Francis T., Bridgeport, Conn. Feeding mechanism for sewing-machines	401,182	Apr. 9	1137	301, 302	47	223
Leilich, Francis T., Bridgeport, Conn. Feeding mechanism for sewing-machines	402,259	Apr. 30	2790	723	47	568
Leilich, Francis T., Bridgeport, Conn. Take-up mechanism for sewing-machines	404,357	May 28	2746	713	47	1212
Leilich, Francis T., Bridgeport, Conn. Feeding mechanism for sewing-machines	404,358	May 28	2748	713, 714	47	1212
Leinard, Edgar A., and G. W. Sheets, Karle, Ohio. Stirrup	403,945	May 28	2095	548	47	1067
Leiss, Frederick, New York, N. Y. Match	401,443	Apr. 16	1531	405	47	312
Leith, Alexander J. (See Foster, Robert F., assignor.)						
Leland, Edwin A., assignor to L. Richardson, Brooklyn, N. Y. Muffler for steam or other heaters	402,336	Apr. 30	2904	752	47	588
Lemieux, Timothy W., Duluth, Minn. Hoisting-machine	401,841	Apr. 23	2154	562	47	437
Lemieux, Timothy W., Duluth, Minn. Cable-grip	401,842	Apr. 23	2155	563	47	437
Lemman, John, assignor to Wakefield Rattan Company, Wakefield, Mass. Reed chair, &c.	401,959	Apr. 23	2330	605	47	471
Lemp, Hermann, Lynn, Mass. Compound-wound alternating-current dynamo	405,263	June 18	1316	347	47	1498
Lemp, Hermann, Lynn, Mass., assignor to Thomson Electric Welding Company, of Maine. Electrical converter	403,541	May 21	1516	397	47	965
Lemp, Hermann, and M. J. Wightman, Hartford, Conn., assignors to Schuyler Electric Company, of Connecticut. Incandescent lamp	401,444	Apr. 16	1532	405	47	312
Lenhart, Frank, Brazil, Ind. Horse-detacher	404,009	May 28	2187	574	47	1105
Lenman, John T., Washington, D. C. Letter-box	404,293	May 28	2648	686	47	1194
Lenoir, John T., Columbia, Miss. Attachment for well-curbs	401,040	Apr. 9	922	246	47	185

McElroy, James F., Lansing, assignor to McElroy Car Heating Company, Detroit, Mich. Car-heating apparatus	404,927	June 11	814	209	47	1392
McElwee, Charles K. (See Hunt, Charles R., assignor.)						
McEwen, Hugh W., Tiverton, Ontario, Canada. Bolting-chest	404,100	May 28	2343	614	47	1137
McFarland, James M., Columbus, Ohio. Slate-cleaner	404,705	June 4	616	159	47	1346
McFarlane, John, assignor of part to G. J. Bessler and H. Wex, Washington, D. C. Hydraulic dredging-machine	401,896	Apr. 23	2234	582, 583	47	453
McFeely, Ronald F., assignor to Electro-Hydraulic Company, Pittsburg, Pa. Electrical apparatus for controlling elevators	404,361	May 28	2753	714, 715	47	1213
McGee, William F. (See Haviland, Joseph H., assignor.)						
McGehee, Abner J., assignor to himself and H. W. McCorry, Jackson, Tenn. Car-coupling	403,282	May 14	1113	295	47	881
McGill, William C., Washington, D. C. Cash-register	405,111	June 11	1071	275, 276	47	1444
McGinnis, John, Valatie, N. Y. Picker-staff connection for looms	405,495	June 18	1671	442	47	1571
McGinnise, Cornelius, Chicago, Ill. Smoke-consumer	401,946	Apr. 23	2160	564	47	438
McGloin, John J., New York, N. Y. Globe-holder	405,793	June 25	2139	562	47	1656
McGovern, Patrick L., Chicago, Ill. Car-heating apparatus	405,112	June 11	1074	286	47	1444
McGovern, Thomas, New York, N. Y. Candelabrum	402,466	Apr. 30	3117	809	47	629
McGregor, Robert, Leigh, county of Lancaster, England. Apparatus for sharpening the cutters and fingers of reaping and mowing machines	404,976	June 11	886	231, 232	47	1407
McGuire, John B., *et al.* (See Chase, Addison K., assignor.)						
McGuire, John C. (See Willson, Thomas L., assignor.)						
McGuire Manufacturing Company. (See McGuire, William A., assignor.)						
McGuire Manufacturing Company. (See Tranell, Johan A., assignor.)						
McGuire, William A., assignor to McGuire Manufacturing Company, Chicago, Ill. Grain-car door	406,062	June 25	2468	646	47	1724
McIlvaine, Catharine. (See McIlvaine, Samuel, assignor.)						
McIlvaine, Samuel, Oakwood, Ontario, assignor to C. McIlvaine, Toronto, Canada. Gas-generator	402,534	Apr. 30	3216	833	47	648
McIndoe, George F. and J. W., Boston, Mass. Machine for impressing letters or marks in cigars	402,467	Apr. 30	3119	809	47	629
McIndoe, James W. (See McIndoe, George F. and J. W.)						
McIntosh Battery and Optical Company. (See Osborn, Chauncey V., assignor.)						
McIntosh, John E. (See Seymour and McIntosh.)						
McIntyre, Neil, Brooklyn, N. Y., assignor to himself and J. J. Manion, East Newark, N. J. Burglar-alarm	402,266	Apr. 30	2799	724	47	569
McKay, Andrew, Philadelphia, Pa. Saddle-tree	403,129	May 14	856	226	47	833
McKay & Copeland Lasting Machine Company. (See Brock, Matthias, assignor.)						
McKay & Copeland Lasting Machine Company. (See Crosbie, John A., assignor.)						
McKean, Hugh S., assignor to E. S. Wright, trustee, Allegheny, Pa. Selvage-shedding device for hand-looms	400,583	Apr. 2	222	60	47	47
	404,725	June 4	515	131, 132	47	1326
McKeand, Sampson S., Ceredo, W. Va. Car-coupling	403,951	May 28	2102	550, 551	47	1089
McKenney, J. Freeman, Baltimore, Md. Sewing-machine take-up	402,608	May 7	84	20	47	680
McKenney, Joel, assignor of one-half to W. O. Robson, Boston, and J. M. French, Chelsea, Mass. Bridle-bit	401,710	Apr. 16	1952	509	47	388
McKenzie, Allen W., Helena, Wis. Car-coupling	401,964	Apr. 23	2246	607	47	472
McKenzie, Joseph, assignor to D. C. Morgan, El Dorado, Cal. Ore-grinding mill	402,345	Apr. 30	2919	757	47	592
McKibben, George N., New York, N. Y. Oil-distributing cartridge and projectile						
McKibbin, George N., *et al.* (See Brewer, William J., assignor.)	401,448	Apr. 16	1536	406	47	313
McKinley, Irving A., Cicero, N. Y. Portable tobacco-press						
McKivitt, William E., St. Paul, Minn., assignor to Western Electric Company, Chicago, Ill. Testing apparatus for switch-boards	405,221	June 11	1246	331	47	1478
	403,952	May 28	2104	551	47	1089
McLane, Hiram H., San Antonio, Tex. Drilling-tool for wells						
McLaren, William. (See Donnelly, McLaren, and Trask.)						
McLaughlin, William G., Springfield, Mo. Scale-beam indicating weight, price, or number of bushels in a quantity of grain	405,370	June 18	1465	388	47	1528
	401,193	Apr. 9	1157	308	47	228
McLean, Joseph, Rockville, Conn. Pot-rest						
McLemore, William Y., *et al.* (See Crafton, Charles B., assignor.)						
McLennan, Christopher. (See Moore and McLennan.)						
McLeod, Alexander E., Hallock, Minn. Lamp-extinguisher	400,584	Apr. 2	224	61	47	47
McMahon, Francis, Somerville, assignor of one-half to J. W. McMahon, West Roxbury, Mass. Hoisting apparatus	403,546	May 21	1522	399	47	966
McMahon, John W. (See McMahon, Francis, assignor.)						
McMaster, Alonzo J., Lockport, N. Y. Camping-vehicle	404,101	May 28	2344	614, 615	47	1137
McNair, David F., Wilkes-Barré, Pa. Trousers-stretcher	404,648	June 4	416	103	47	1304
McNally, Andrew. (See Steele, James W., assignor.)

Perino, Josef, Charlottenburg, near Berlin, Germany. Extracting copper from copper pyrites	401,056	Apr. 9	946	.....	47	189
Perkins, Benjamin F., Holyoke, Mass. Filtering apparatus	401,057	Apr. 9	947	252, 253	47	189
Perkins, Frank G., Mishawaka, Ind. Bushing for pulleys	404,300	May 28	2656	690	47	1195
Perkins, Thomas G., Chicago, assignor of one-half to E. C. Read, Blue Island, Ill. Machine for cutting rails	400,707	Apr. 2	402	109, 110	47	80
Perret, Frank A., Brooklyn, N. Y., assignor to Elektron Manufacturing Company, of New York. Dynamo-electric machine	403,487	May 14	1427	373, 374	47	940
Perret, Frank A., Brooklyn, N. Y., assignor to Elektron Manufacturing Company, of New York. Electric-motor starting and stopping device	405,223	June 11	1249	331	47	1479
Perret, Michel, Paris, France. Furnace	402,474	Apr. 30	3132	811, 812	47	632
Perret, Paul, Chaux-de-Fonds, Switzerland. Watch-pendant	402,473	Apr. 30	3131	811	47	632
Perriman, Henry, Essenden, and C. F. Alger, Melbourne, Victoria. Implement for straining wire	405,796	June 25	2143	563	47	1667
Perrin Frères. (See Raymond, Pierre A., assignor.)						
Perrin, William H., assignor of one-half to B. Colborne, Smith's Falls, Ontario, Canada. Tilting colter-holder	403,551	May 21	1527	400	47	967
Perry, Fred H., Montpelier, Vt. Toe-weight	404,109	May 28	2362	619	47	1140
Perry, Joseph R. (See Hopkins and Perry.)						
Perry, William A. (See Hathaway, George H., assignor.)						
Pertin, Léon, Green Point, assignor to Ravenswood Art Glass Works, New York, N. Y. Ornamenting glass	403,552	May 21	1527	400	47	968
Peters, Emil, Merscheid, Germany. Scissors	400,480	Apr. 2	79	22	47	18
Petersen, Christian. (See Hooper and Petersen.)						
Peterson, Alpheus, Horsham, Pa. Gate	402,348	Apr. 30	2928	759	47	593
Peterson, Henry, Berkeley, assignor of two-thirds to J. B. Wilson and W. F. Delaney, Oakland, Cal. Attachment for lawn-mowers	402,189	Apr. 30	2689	699	47	548
Petherick, Vernon, Brisbane, Queensland. Sheep-shears	405,500	June 18	1679	444	47	1573
Petherick, William W. (See Devens, Elijah J., assignor.)						
Petroleum Fuel Company. (See Lombard, Levi W., assignor.)						
Petsche, Bernhard, Philadelphia, Pa. Paper-file	405,596	June 18	1821	482	47	1602
Pettengill, Frederick B., assignor of one-half to E. Nicholson, Roscdale, Kans. Steam-valve governor	404,796	June 4	617	158	47	1347
Petterson, Ludwig, Chicago, Ill. Box-fastener	404,723	June 4	519	133	47	1327
Pettet, Miles. (See Wistar and Pettet.)						
Pettge, Friedrich, and L. Metzger, Dessau, Anhalt, Germany. Bung	403,956	May 28	2109	552	47	1090
Pettigrew, Charles, *et al.* (See Treat, Francis H., assignor.)						
Pfanne, Carl A. G., assignor to Parker, Stearns & Sutton, Brooklyn, N. Y. Hair-curling device	404,501	June 4	201	48	47	1262
Pfannenstiel, Hermann E., Dantzic, Prussia, Germany. Signal-sounding apparatus	404,980	June 11	890	233	47	1408
Pfannkuche, Gustav, assignor to Brush Electric Company, Cleveland, Ohio. Regulation of alternating electric-current generators	404,859	June 11	714	183	47	1373
Pfannkuche, Gustav, assignor to Brush Electric Company, Cleveland, Ohio. Apparatus for indicating the strength of the current in an electric circuit	404,860	June 11	717	183, 184	47	1374
Pfannkuche, Gustav, assignor to Brush Electric Company, Cleveland, Ohio. Indicating the strength of the current in an electric circuit	404,861	June 11	719	184	47	1374
Pfannkuche, Gustav, assignor to Brush Electric Company, Cleveland, Ohio. Regulation of alternating electrical current generators	405,174	June 11	1169	312	47	1463
Pfatischer, Matthias, New York, N. Y., assignor to Electrical Accumulator Company, of New York. Distribution of electricity by secondary batteries	402,349	Apr. 30	2930	759	47	593
Pfau, Christian F., Quincy, Ill. Egg-beater	401,058	Apr. 9	949	253	47	189
Pfeifer, Peter, Durhamville, N. Y. Device for conveying sheets of glass through the annealing-tunnel	400,708	Apr. 2	405	110	47	80
Pfeil, Philip, assignor of one-half to G. Brandon, St. Louis, Mo. Detachable strainer	405,373	June 18	1468	380	47	1529
Pfingst, Louis. (See Bemis and Pfingst.)						
Pfingst, Louis, Boston, and S. A. Bemis, Springfield, Mass. Alarm-signal for cable and electric railway cars	404,981	June 11	891	233	47	1408
Pfouts, Leroy S., Wilmot, Ohio. Wind-wheel	402,475	Apr. 30	3135	813	47	632
Phalan, James H., New Haven, assignor to Electrical Supply Company, Ansonia, Conn. Galvanic battery	401,059	Apr. 9	950	253	47	189
Phelan, Merton D., Wollaston, assignor to J. W. Brooks, trustee, Cambridge, Mass. Rotary cutter for trimming-machines	400,788	Apr. 2	535	147	47	103
Phelps, Andrew S., Chicago, Ill. Heating-stove	400,481	Apr. 2	79	22	47	18
Phelps, Bradley N., New York, N. Y. Draw-bar and hook	403,133	May 14	861	227	47	834
Phelps, Homer L., Athens, Pa. Rotary steam-engine	404,557	June 4	292	69	47	1280
Phelps, Niel S., and C. L. Ellis, Eureka, Cal. Parallel-ruler	400,596	Apr. 2	240	65	47	50
Phelps, Walter S., St. Catalina, Guantanamo, Cuba. Valve for steam-engines	401,853	Apr. 23	2168	565	47	440
Phillips, Allen W., Providence, R. I. Desk-box	401,757	Apr. 23	2028	530	47	414
Phillips, Ambrose A., Toledo, Ohio. Hydrocarbon-burner	403,134	May 14	863	227	47	834
Phillips Economical Cable Grip Construction Company. (See Phillips, Elwood C., assignor.)						
Phillips, Elwood C., Garden City, Kans., assignor to Phillips Economical Cable Grip Construction Company, Chicago, Ill. Conduit for cable railways	400,482	Apr. 2	80	23	47	18
Phillips, Francis V., assignor to Chicago Sash Pulley Company, Chicago, Ill. Machine for grooving window-sash	400,597	Apr. 2	241	65	47	50
Phillips, George H., Geneva, N. Y. Range	404,502	June 4	302	48	47	1262
Phillips, Heman H., Boulder, Colo. Gate	405,175	June 11	1179	312	47	1463

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Dr'g.	Official Gazette. Vol.	Official Gazette. Page.
Phillips, William J., and C. Humphrys, Wauseon, Ohio. Screen	403,553	May 21	1528	401	47	968
Phono Multiplex Telegraph Company. (See Van Rysselberghe, François, assignor.)						
Pickering, Washington P., Boston, Mass. Wagon-jack	404,223	May 28	2546	664	47	1175
Pickernell, Frank A., East Orange, N. J., assignor to American Telephone and Telegraph Company, New York, N. Y. Telephone combination-circuit	405,677	June 18	1907	576	47	1627
Pickert, Augustus F., Atlanta, Ga. Compensation watch-balance	402,032	Apr. 23	2445	637	47	492
Pickett, Chancy J., assignor of two-thirds to W. I. Brotherton and H. N. Watrous, Bay City, Mich. Coffee-cleaning machine	404,430	June 4	82	20	47	1242
Pickett, Lyman B., Montrose, Pa. Sled	404,432	June 4	87	21	47	1242
Pickhardt, Emile, Islington, Mass. Button-loop	403,609	May 21	1508	423	47	982
Pickhardt, Emile, Islington, Mass., and D. A. Carpenter, New York, N. Y. Safety-pin	403,607	May 21	1507	423	47	982
Pickhardt, Emile, Islington, Mass., and D. A. Carpenter, New York, N. Y. Safety-pin	403,608	May 21	1507	423	47	982
Picking, George G., and W. Hopkins, Bow, county of Middlesex, England. Steam or other pump	405,501	June 18	1681	444, 445	47	1574
Pictet, Raoul P., Geneva, assignor of one-half to G. L. Breiaz, Lausanne, Switzerland. Disintegrating fibrous materials	404,431	June 4	84	21	47	1242
Pieper, Henri, Fils, Liege, Belgium. Electric-arc lamp	405,906	June 25	2306	606	47	1607
Pierce, Charles W., Oak Hill, N. Y. Wardrobe-hook	402,966	May 7	602	158	47	778
Pierce, Frank L., Clay Centre, Kans. Latch	403,554	May 21	1529	401	47	968
Pierce, Otis S. (See Bray and Pierce.)						
Pierson, John W., assignor of one-half to J. A. Dickinson, St. Aubert, Mo. Tank-fountain	405,271	June 18	1329	350	47	1500
Piggott, Henry E., assignor of part to E. B. Roth and W. H. Barnett, St. Louis, Mo. Smoke-preventer for furnaces	400,709	Apr. 2	407	110, 111	47	81
Pike, William H., London, England. Gas-stove	404,652	May 28	2366	592	47	1190
Pillow, Benjamin A., Richmond, Va. Boot or shoe	401,060	Apr. 9	951	253	47	190
Pilon, Paul, and J. Ploudre, West Quincy, Mass. Walking-stick	401,061	Apr. 9	952	254	47	190
Pilon, Philip, Hinesburg, Vt. Wagon-brake	400,942	Apr. 9	779	208	47	158
Pilson, James H., Washington, D. C. Folding bracket	403,775	May 21	1846	465	47	1031
Pincus, Henry, Rockaway, N. J. Portable shaving-stand	404,110	May 28	2362	620	47	1140
Pinder, Joseph L. (See White, Albert, assignor.)						
Pinder, Joseph L. (See Young, Harlan P., assignor.)						
Pine, John T., New York, N. Y. Steam-heating apparatus	403,287	May 14	1119	297	47	882
Pinkowski, Friedrich. (See Klinik, Pinkowski, and Gross.)						
Piper, William M., Allegheny, Pa. Lifting-jack	401,368	Apr. 16	1490	375	47	291
Pirnay, Joseph. (See Francken and Pirnay.)						
Pirotte, Andrew J., Manton, R. I. Stop-motion for looms	402,767	May 7	390	83	47	723
Pitkin, Stephen H. (See Bartlett, John S., assignor.)						
Pitts Agricultural Works. (See Bronson, Levi, assignor.)						
Platt, Irving G., Waterbury, Conn. Apparatus for making seamless tubes	405,115	June 11	1077	287	47	1445
Ploudre, Joseph. (See Pilon and Ploudre.)						
Plumb, Henry B., assignor to Eagle Lock Company, Terryville, Conn. Trunk-lock	401,062	Apr. 9	953	254	47	190
Plume & Atwood Manufacturing Company. (See Atwood, Lewis J., assignor.)						
Plume & Atwood Manufacturing Company. (See Atwood and Tobey, assignors.)						
Plume & Atwood Manufacturing Company. (See Egleston, Thomas, assignor.)						
Plumer, William E., Sioux City, Iowa. Draft-equalizer	403,135	May 14	864	228	47	834
Plummer, Frank J., Philadelphia, Pa. Wood-planing machine	404,433	June 4	87	21, 22	47	1242
Pneumatic Steering Gear and Manufacturing Company. (See Dunn, Ambrose C., assignor.)						
Poe, Isaac N., assignor to Union Manufacturing Company, Toledo, Ohio. Wash-board	404,729	June 4	590	133	47	1327
Poffenbarger, Josias, York, Nebr. Car-coupling	401,854	Apr. 23	2169	566	47	440
Poindexter, John E., assignor of one-third to J. E. Smith and G. M. Randolph, St. Louis, Mo. Hair-singer	405,502	June 18	1683	445	47	1574
Pole, Benjamin C., Camden, N. J. Motor for street-railways	401,855	Apr. 23	2171	567	47	441
Polk, Liberty B., Wilmington, Ohio. Paper-hanging machine	402,612	May 7	90	22	47	681
Pollard, Edward, East Cambridge, Mass. Burner	402,476	Apr. 30	3136	812	47	633
Pollard, Frank B. (See Hewitt, William, assignor.)						
Pollard, James M., Washington, D. C. Split pulley	401,586	Apr. 16	1749	462	47	351
Polley, Clark, New Berlin, Fla. Weather-strip	405,272	June 18	1330	350	47	1501
Pollock, James R., Kansas City, Mo. Suspenders	405,374	June 18	1460	380	47	1529
Pomeroy, Charles, New York, N. Y., assignor, by mesne assignments, to Vulcan Manufacturing Company. Wrench	401,513	Apr. 16	1635	432	47	321
Pomeroy, Jerome L., New Haven, Conn. Flexible razor-strop	402,033	Apr. 23	2447	637	47	492
Pommer, Frank L. (See Heimann, Salomon, assignor.)						
Pontious, Marshal E., Cleveland, Ohio. Machine for making bird-targets	400,870	Apr. 2	602	160	47	127
Pooley, Henry, Liverpool, county of Lancaster, England. Steelyard for weighing-machines	403,136	May 14	865	228, 229	47	834
Poor, George H., St. Louis, Mo., assignor to Westinghouse Air Brake Company, Pittsburg, Pa. Brake-head and lever for operating the same	402,276	Apr. 30	2814	728	47	572
Poore, James M., Spring Valley, Minn. Harrow, seeder, and planter	405,797	June 25	2145	564	47	1668
Poorman, Emanuel W., Canton, Ohio. Boiler	401,369	Apr. 16	1421	376	47	291
Poorman, Emanuel W., Canton, Ohio. Rock and earth drilling machine	403,555	May 21	1530	401, 402	47	968
Pope, Charles H. (See Tebbetts, Pope, and Stewart.)						
Pope, Edwin, Quebec, Quebec, Canada. Individual call and switch	403,776	May 21	1847	485, 486	47	1031
Pope Manufacturing Company. (See Fowler, Nathaniel C., Jr., assignor.)						
Pope Manufacturing Company. (See Knous, John, assignor.)						
Popp Compressed Air and Electric Power Company. (See Popp, Victor, assignor.)						
Popp, Victor, Paris, France, assignor to Popp Compressed Air and Electric Power Company, (limited.) Means or apparatus for the production and distribution of compressed air	405,971	June 25	2413	631, 632, 633	47	1715
Porter, Alexander T. (See Ball and Norton, assignors.)						
Porter, Andrew C., assignor of one-half to C. W. Higgison, Utica, N. Y. Holder for umbrellas or analogous articles	400,598	Apr. 2	243	66	47	51
Porter, Edward E., Cincinnati, Ohio. Self-locking press for bundle-wrapping	401,587	Apr. 16	1752	463	47	352
Porter, George A., *et al.* (See Casey, Thomas A., assignor.)						
Porter, George W., Allegheny, Pa. Elevator-car-operating device	402,277	Apr. 30	2816	728, 729	47	572
Porter, James B., Yarmouth, Nova Scotia, Canada. Trunk-fixture	404,111	May 28	2363	620	47	1141
Porter, John B., New York, N. Y., assignor to Sewall Safety Heating Company, Portland, Me. Car-heating apparatus	402,540	Apr. 30	3223	836	47	649
Porter, John B., New York, N. Y., assignor to Sewall Safety Heating Company, Portland, Me. Car-heating apparatus	402,541	Apr. 30	3224	836	47	649
Porter, Joseph S., assignor of two-thirds to F. G. Scofield and J. L. Moore, Sandusky, Ohio. Freight-car door	405,848	June 25	2214	583	47	1681

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Porter, William H., Washington, D. C. Top for desks	400,871	Apr. 2	664	180	47	127
Post, C. C., *et al.* (See Southard, Stephen P., assignor.)						
Post, Henry H., Oswego, N. Y. Machine for manufacturing cylindrical rods	404,654	June 4	422	104 105	47	1306
Postlethwaite, Charles E., South Hackney, England. Lamp-extinguisher	400,789	Apr. 2	537	147 148	47	103
Poston, George C. (See Fain and Poston.)						
Potter-Compton Electric Company. (See Serson, James, assignor.)						
Potter, Herbert E. (See Eastman and Potter.)						
Potter, Hobert B., Hillburn, N. Y. Interlocking device for railway-switches	400,943	Apr. 9	780	206	47	158
Potts, George L., Appleton, Wis. Attachment for railway-cars	405,322	June 18	1400	368	47	1516
Potts, Isaac B., Columbus, Ohio. Boiler for heating purposes	401,300	Apr. 9	1316	350	47	259
Potts, James F. (See Fischer, August, assignor.)						
Potts, Joseph H., Philadelphia, Pa. Cleaning metal castings	405,716	June 25	2032	.....	47	1645
Potts, Robert, St. Thomas, Ontario, Canada. Registering-gage for railway-car brakes	403,210	May 14	992	261	47	859
Pottstown Iron Company. (See Bertrand, Ernst, assignor.)						
Poulson, Niels, Brooklyn, N. Y. Metallic grill or guard	404,982	June 11	892	233 234	47	1408
Pounder, Alfred W. (See Conrad and Pounder.)						
Pounder, Malcolm, *et al.* (See Conrad and Pounder, assignors.)						
Powell, Charlotte. (See Huber, Katie, assignor.)						
Powell, James, Cincinnati, Ohio. Floor-key for cocks	400,944	Apr. 9	783	206	47	150
Powell, James, Cincinnati, Ohio. Lubricator	403,695	May 21	1726	455	47	1008
Powell, James, Cincinnati, Ohio. Die for compressing valve-blanks	403,696	May 21	1727	455	47	1008
Power & Co., L. (See Power, Laurence, assignor.)						
Power, Laurence, assignor to L. Power & Co., Philadelphia, Pa. Planing machinery	405,431	June 18	1559	412	47	1547
Powers, David J., Chicago, Ill. Ditching-machine	404,301	May 28	2657	691 692	47	1195
Powers, James J., New York, N. Y. Sewage-purifier	401,458	Apr. 16	1550	410	47	315
Pracy, Joseph. (See Day, Jeremiah E., assignor.)						
Praschl, Stephan, Paris, France, assignor to M. M. Mihalovitch, Cincinnati, Ohio. Vending apparatus	403,069	May 7	761	200	47	806
Pratt, George W., and J. P. Hanson, Oshkosh, Wis. Log-loading machine	400,790	Apr. 2	530	148 149	47	103
Pratt, Harry P., Chicago, Ill. Magnetic shield for watches	403,211	May 14	994	257	47	860
Pratt, Harry P., Chicago, Ill. Electrode for electro-therapeutic body-wear	405,176	June 11	1173	310	47	1464
Pratt & Letchworth. (See Hewitt, Leslie, assignor.)						
Pratt, Nathaniel A., Atlanta, Ga., assignor to Pratt Steel Company, Birmingham, Ala. Flux-feeding apparatus for blast-furnaces	401,063	Apr. 9	954	254	47	190
Pratt, Nathaniel A., Atlanta, Ga., assignor to Pratt Steel Company, Birmingham, Ala. Flux-feeder for blast-furnaces	402,103	Apr. 23	2557	665	47	513
Pratt, Robert J., Greenbush Heights, N. Y., assignor to Water Primary Battery Company, Jersey City, N. J. Galvanic battery	402,104	Apr. 23	2559	665	47	514
Pratt, Smith, Granville, Ohio. Table-slide	402,967	May 7	602	159	47	778
Pratt Steel Company. (See Pratt, Nathaniel A., assignor.)						
Pratt, Wallace E., Boston, Mass. Center-square, bevel, and protractor	405,432	June 18	1561	412	47	1548
Pratt & Whitney Company. (See Cooley, Charles H., assignor.)						
Pratt & Whitney Company. (See Richards, Francis H., assignor.)						
Pratt & Whitney Company. (See Whitney, Amos, assignor.)						
Pray, Lewis, Portland, Me. Piano lamp-holder	401,064	Apr. 9	955	254	47	191
Predmore, William H., Walworth, Nebr. Calf-weaner	404,931	June 11	819	210	47	1393
Prentis, Charles, *et al.* (See Elmendorf, Albert, assignor.)						
Prescott, George B., Jr., Newark, N. J., assignor to Electrical Accumulator Company, of New York. Distribution of electricity by secondary batteries	402,190	Apr. 30	2690	699	47	548
Prescott, George B., Jr., Newark, N. J., assignor to Electrical Accumulator Company, of New York. System of distribution by secondary batteries	402,191	Apr. 30	2691	699	47	548
Prescott, George B., Jr., Newark, N. J., assignor to Electrical Accumulator Company, of New York. Distribution of electricity by secondary batteries	402,192	Apr. 30	2693	699	47	549
Prest, John E., Northbridge, Mass. Drop-wire stop mechanism for warping-machines	402,278	Apr. 30	2817	729	47	573
Preston, Clarissa, Pittsburg, Pa. Pan for baking and roasting	404,558	June 4	293	69	47	1280
Preston, James F. (See Case and Preston.)						
Preston, William, assignor of one-half to J. J. Kelly, Brooklyn, N. Y. Grain-press	404,655	June 4	424	106	47	1306
Preuss, Rudolph, assignor of one-half to F. Kunkel, Milwaukee, Wis. Woven-wire mattress	401,301	Apr. 9	1317	330	47	259
Price, George W., assignor to J. R. Johnson, F. M. Dunn, and J. F. Walters, Baltimore, Md. Store-service apparatus	403,070	May 7	762	201	47	806
Price, John B., Wollaston Heights, Mass., assignor to Electrical Accumulator Company, of New York. Secondary battery	403,957	May 28	2110	532	47	1090
Price, Noah C., Pocatello, Idaho Ter. Attachment for brake-rods	405,798	June 25	2147	544	47	1668
Price, Solomon. (See Lieberthal, Hyman, assignor.)						
Price, Walter, Lyons, Nebr. Corn-planter attachment	403,369	May 14	1244	330	47	906
Pridmore, Henry E., assignor to McCormick Harvesting Machine Company, Chicago, Ill. Harvester-binder	401,901	Apr. 23	2241	584	47	454
Pridmore, Henry E., assignor to McCormick Harvesting Machine Company, Chicago, Ill. Sheaf-carrier	401,902	Apr. 23	2245	585	47	455
Priebe, Herman C., Englewood, Ill. Clothes-line reel	402,477	Apr. 30	3137	812	47	633
Priest, Edward D., Lynn, Mass. Track-moistening apparatus for electric railways	404,559	June 4	294	70	47	1280
Prince, William H. (See Crane and Prince.)						
Pringle, Eugene, *et al.* (See Mandrill, George W., assignor.)						
Pritchard Brake Company. (See Pritchard, Nathaniel J., assignor.)						
Pritchard, Henry. (See Millar and Pritchard.)						
Pritchard, Nathaniel J., Milnes, assignor to Pritchard Brake Company, Roanoke, Va., Steam-pump	405,116	June 11	1078	287 288	47	1445
Protzman, Ferdinand, Sr., *et al.* (See Gnest, Joseph, assignor.)

Reymond, August. (See Winterdorf and Reymond.)						
Reynolds, Andrew J., Philadelphia, Pa. Resonator for organs or pianos	405,323	June 18	1401	369	47	1516
Reynolds, Benjamin F., Chicago, Ill. Warm-air furnace	404,561	June 4	296	70	47	1281
Reynolds, Earl H., Prophetstown, Ill. Automatic grain-meter	404,225	May 28	2548	664, 665	47	1175
Reynolds, Hanford, Gifford, Ill. Tank-heater	405,052	June 11	998	266	47	1430
Reynolds, Henry S., Brooklyn, N. Y. Sheet-metal vessel	401,211	Apr. 9	1180	314	47	232
Reynolds, James A. (See Kuhn and Reynolds.)						
Reynolds, Stephen D., Nevada, Mo. Bicycle	404,562	June 4	298	71	47	1281
Reynolds, Walter S. (See Shipman and Reynolds.)						
Rheubottom, Homer E., assignor to Rheubottom & Teall Manufacturing Company, Weedsport, N. Y. Bustle	404,798	June 4	622	159, 160	47	1347
Rheubottom & Teall Manufacturing Company. (See Rheubottom, Homer E., assignor.)						
Rheutan, Abram A., assignor to W. H. Hill, Worcester, Mass. Envelope-machine	401,462	Apr. 16	1557	412, 413, 414	47	317
Rhoads, Jonathan A., East Liverpool, Ohio, assignor of one-half to G. M. Irwin, Pittsburg, Pa. File-box	402,195	Apr. 30	2697	700	47	550
Rhodes, James B., Grand Rapids, Mich. Saw-tooth-swaging device	402,770	May 7	325	84	47	724
Rhodes, John W., Havana, Ill. Grain-drill	400,957	Apr. 9	786	210	47	159
Rice, Charles B., New Market, Va. Machine for pointing fence-pickets	405,181	June 11	1180	314	47	1465
Rice, Edwin W., Jr., Lynn, Mass. Transfer system of electric distribution	400,486	Apr. 2	85	24	47	20
Rice, Thomas C., Worcester, Mass. Fire-extinguisher	402,970	May 7	605	159	47	778
Rich, Edwin. (See Rich, Harrison, assignor.)						
Rich, Harrison, assignor of one-half to E. Rich, Muskegon, Mich. Device for launching lumber-piles	401,370	Apr. 16	1423	376	47	292
Richard, Charles, Paris, France. Steam-trap	405,804	June 25	2152	566	47	1609
Richards, Francis H., Hartford, Conn., assignor to American Heel Protector Company, Newark, N. J. Heel-protector	401,069	Apr. 9	962	256	47	192
Richards, Francis H., Hartford, Conn., assignor to Office Specialty Manufacturing Company, of New York. Mechanical movement	403,373	May 14	1249	331	47	907
Richards, Francis H., Hartford, assignor to American Button Fastener Company, New Britain, Conn. Button-setting machine	403,611	May 21	1601	424, 425	47	983
Richards, Francis H., Hartford, Conn., assignor to E. B. Coxe, Drifton, Pa. Drilling-machine	404,364	May 28	2759	716	47	1214
Richards, Francis H., Hartford, Conn., assignor to E. B. Coxe, Drifton, Pa. Feed mechanism	404,365	May 28	2762	716	47	1215
Richards, Francis H., Springfield, Mass., assignor of one-half to Pratt & Whitney Company, Hartford, Conn. Envelope-machine	401,718	Apr. 16	1964	512, 513, 514	47	391
Richards, Francis H., Springfield, Mass., assignor to D. W. Dodson, Wilkes-Barré, Pa. Mechanical movement	401,371	Apr. 16	1424	376, 377	47	292
Richards, Francis H., Springfield, Mass., assignor to D. W. Dodson, Wilkes-Barré, Pa. Mechanical movement	401,904	Apr. 23	2249	585, 586	47	455
Richards, Francis H., Springfield, Mass., assignor to D. W. Dodson, Wilkes-Barré, Pa. Type-writing machine	403,216	May 14	1000	264, 265, 266	47	861
Richards, Francis H., Springfield, Mass., assignor to D. W. Dodson, Wilkes-Barré, Pa. Mechanical movement	403,217	May 14	1005	266	47	861
Richards, Francis H., Springfield, Mass., assignor to D. W. Dodson, Wilkes-Barré, Pa. Mechanical movement	403,288	May 14	1120	297	47	882
Richards, Francis H., Springfield, Mass., assignor to D. W. Dodson, Wilkes-Barré, Pa. Mechanical movement	403,289	May 14	1121	297, 298	47	883
Richards, John, San Francisco, Cal. Micrometer-gage	404,305	May 28	2667	692, 693	47	1197
Richards, John, San Francisco, Cal., and J. Walker, Cleveland, Ohio. Machine for driving mandrels, keys, &c.	401,968	Apr. 23	2342	608	47	473
Richards, Ransom. (See Wetherell and Jones, assignors.)						
Richards, Theron A., *et al.* (See Robertson, James H., assignor.)						
Richardson, Harry K. (See Daily and Richardson.)						
Richardson, Isaac C., Nashua, N. H. Heating apparatus	405,504	June 18	1686	446	47	1574

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Richardson, John E. (See Earhart, John F., assignor.)						
Richardson, John S., Lowell, assignor of one-half to G. Draper & Sons, Hopedale, Mass. Support for spinning-spindles	403,862	May 21	1973	518	47	1055
Richardson, John T., Harrisburg, assignor of one-half to A. H. Ege, Mechanicsburg, Pa. Railway-switch	404,864	June 11	725	183	47	1375
Richardson, John T., Harrisburg, assignor of one-half to A. H. Ege, Mechanicsburg, Pa. Binding-bar	404,865	June 11	726	183	47	1375
Richardson, Leonard. (See Leland, Edwin A., assignor.)						
Richardson, Marcus F. (See Wisner, Andrew J., assignor.)						
Richardson, Solon O., Jr. (See Locke and Richardson.)						
Richardson, William H., assignor of two-thirds to J. M. McClintock and H. T. Meloney, Baltimore, Md. Child's carriage	405,599	June 18	1827	484	47	1603
Richardson, William H., assignor of two-thirds to J. M. McClintock and H. T. Meloney, Baltimore, Md. Child's carriage	405,600	June 18	1827	485	47	1604
Richardson, William S, Boston, Mass. Fastening for gloves	400,948	Apr. 9	787	210	47	160
Richardson, William S., Boston, Mass. Glove-fastening	401,070	Apr. 9	963	257	47	192
Richmond Locomotive and Machine Works. (See Simpkin, William, assignor.)						
Rickerd, Daniel H. (See Marshall and Rickerd.)						
Ricketson, James C., Milwaukee, Wis. Electric signal for engine-shafts	404,866	June 11	727	183	47	1375
Ricketson, James C., Milwaukee, Wis. Electric indicator for engine-shafts	404,867	June 11	729	183	47	1375
Ricketts, James J., Pittsburg, Pa. Flushing apparatus	405,912	June 25	2317	603	47	1698
Ricter & Company, John J. (See Frey, Jakob, assignor.)						
Riddell, Edward H. (See Davis and Riddell.)						
Riddle & Williams. (See Chappell, Florance J. D., assignor.)						
Rider, Charles M., assignor of one-half to W. Baker, Newark, Ohio. Breech-loading fire-arm	400,712	Apr. 2	410	119	47	81
Rider, Charles M., assignor of one-half to W. Baker, Newark, N. J. Device for automatically operating the stop-cock of a gas-burner	404,733	June 4	524	134	47	1398
Rider, Thomas J., assignor, by mesne assignments, to W. De Lamater and L. A. Bevin, New York, N. Y. Piston for caloric-engines	405,324	June 18	1403	369	47	1516
Rider, Thomas J., assignor to C. H. De Lamater, New York, N. Y. Pump	405,680	June 18	1979	517	47	1628
Rieger, Jean J., Lure, France. Cylinder for carding-machines, &c	402,616	May 7	95	22	47	689
Ries, Elias E., Baltimore, Md. Electric riveting apparatus	403,374	May 14	1251	324	47	907
Ries, Elias E., Baltimore, Md. Electric riveting	404,306	May 28	2669	693	47	1198
Ries, Elias E., Baltimore, Md., assignor to Ries & Henderson. Welding together sections of pipe by electricity	402,107	Apr. 23	2562	665	47	514
Ries, Elias E., Baltimore, Md., assignor to Ries & Henderson. Welding together sections of pipe by electricity	402,108	Apr. 23	2565	666	47	515
Ries, Elias E., Baltimore, Md., assignor to Ries & Henderson. System of linear transformers	402,971	May 7	606	159	47	778
Ries & Henderson. (See Ries, Elias E., assignor.)						
Riesenberg, Harry, St. Louis, Mo. Electric-alarm advance car	401,591	Apr. 16	1757	464	47	353
Rightmyer, Frank, assignor of one-half to C. C. Adelsperger, Springfield, Ohio. Shifting seat for vehicles	405,224	June 11	1251	332	47	1479
Riker, Margaretta, New York, N. Y. Bed-pan	405,152	June 11	1181	314	47	1465
Riley, George N., Braddock, Pa. Pipe-coupling	400,949	Apr. 9	788	210	47	160
Riley, George N., Braddock, Pa. Tube-coupling. (Reissue)	10,994	Apr. 16	1983	519	47	305
Riley, John, Troy, N. Y. Non-conducting jacket	403,700	May 21	1732	456	47	1009
Rime, Hugues, assignor to Société Armand Schwab et Frère, Paris, France. Time-piece	402,972	May 7	606	160	47	779
Rinehart, Bentley L., Camden, N. J. Condenser for exhaust-steam	405,849	June 25	2215	583	47	1682
Ringo, William E. (See Purnell, Richard H., assignor.)						
Ringwood, Thomas R., Scipio, N. Y. Cultivator	402,196	Apr. 30	2698	709	47	550
Ripley, Charles W. E., Washington, D. C. Kitchen table and dresser	403,139	May 14	873	230	47	836
Ritchie, James, Flatbush, N. Y. Sanding device for street-cars	405,565	June 18	1689	446	47	1575
Ritchie, Lizzie, Portland Place, county of Middlesex, England. Musical skipping-rope	403,556	May 21	1532	402	47	969
Ritea, Francis M. (See Westinghouse and Ritea.)						
Ritter, John L., assignor of one-half to J. P. Brown, Milnes, Va. Egg-tester	405,601	June 18	1828	485	47	1604
Ritter, Oliver C., Springfield, Mo. Milling wheat	405,506	June 18	1690	447	47	1575
Ritterbush, Jacob. (See Unger, Martin L., assignor.)						
River and Rail Electric Light Company. (See Maln, William, assignor.)						
Rivers, David H., Stoneham, Mass., assignor of one-half to N. Smith, San Francisco, Cal. Ship's windlass indicator	404,983	June 11	893	234	47	1409
Roach, Robert N., Monroe, Iowa. Lift-pump	400,467	Apr. 2	87	24	47	20
Roads, Joseph W., and T. J. Griffith, Marion, Ohio. Burglar-alarm	404,734	June 4	525	135	47	1328
Robb, James A., San José, Cal. Chimney or stack propeller and governor	401,516	Apr. 16	1639	433	47	331
Robbin, Frederick, Rochester, N. Y. Sled-propeller	403,960	May 28	2115	553	47	1091
Robbins, Arthur C., Brooklyn, N. Y. Fire and police signaling apparatus	404,226	May 28	2532	665	47	1176
Robbins, Roldin S., and A. H. Broad, Berkley, Cal. Wall-protector	402,857	May 7	453	119	47	747
Robbins, William G., Bromfield, Nebr. Harness-pad	403,480	Apr. 30	3140	813	47	633
Robbins, William S., New Bedford, Mass. Grinding-machine	401,212	Apr. 9	1181	314	47	232
Roberts, Andre, Pattonville, Tex. Medical compound	400,793	Apr. 2	545	.....	47	105
Roberts, Cyrus, Three Rivers, Mich. Potato-digger	403,375	May 14	1253	332	47	906
Roberts, Edward C., Abingdon, Va. Wheel-hub	401,213	Apr. 9	1181	314	47	233
Roberts, Fabian J., assignor to F. J. Roberts R. R. Dust Guard Manufacturing Company, Detroit, Mich. Dust-guard for car-axle boxes	402,858	May 7	453	119	47	748
Roberts, George A., Paducah, Ky. Car-roof	404,735	June 4	526	135	47	1328
Roberts, George R., Panora, Iowa. Washing-machine	402,667	May 7	199	50	47	701
Roberts, Henry P. (See Altice, Roberts, and Reed.)						
Roberts, John, Boston, Mass. Slip's sail	401,373	Apr. 16	1429	378	47	293
Roberts R. R. Dust Guard Manufacturing Company, F. J. (See Roberts, Fabian J., assignor.)						
Roberts, Solomon W., and E. P. Caldwell, Minneapolis, Minn. Track-layer	400,950	Apr. 9	790	211	47	160
Roberts, Solomon W., and E. P. Caldwell, Minneapolis, Minn. Rail-spiking machine	401,374	Apr. 16	1430	378	47	293
Robertson, George F., and W. D. Gammon, Morristown, Tenn. Churn	403,140	May 14	874	230	47	836
Robertson, Gideon. (See Russell, William H., assignor.)						
Robertson, James, Birmingham, county of Warwick, England. Rolling-mill	403,290	May 14	1123	298	47	883
Robertson, James H., Rutherford, N. J. Exchange system for telegraphs	403,291	May 14	1126	298	47	883
Robertson, James H., Rutherford, N. J. Combined telephony and telegraphy	403,292	May 14	1127	299	47	883
Robertson, James H., Rutherford, N. J., assignor of three-fifths to T. A. Richards and J. Robertson, Brooklyn, N. Y. Regulator for dynamo-electric machines	405,743	June 25	2074	544	47	1653
Robertson, John, *et al.* (See Robertson, James H., assignor.)						
Robertson, Touro, New York, N. Y. Numbering attachment for printing-presses	400,599	Apr. 2	244	66	47	51
Robilliard, Daniel S., and C. G. Davies, Quebec, Quebec, Canada. Gas burner and heater	403,612	May 21	1604	425	47	963
Robinson, Albert, Grand Rapids, Mich. Filling teeth	402,358	Apr. 30	2604	760	47	594

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Robinson, Albert G., Brooklyn, N. Y. Wash-tub	404,984	June 11	894	234	47	1409
Robinson, Alfred H. (See Hogg and Robinson.)						
Robinson, Frank T. (See Atwood, La Motte C., assignor.)						
Robinson, James O. (See Julier and Robinson.)						
Robinson, John K., Chicago, Ill. Match-safe	400,488	Apr. 2	88	24	47	20
Robinson, Miner, Newton, Mass. Electric-circuit-testing device	400,951	Apr. 9	793	212	47	161
Robinson, Robert J., and C. F. Collins, Linneus, Mo. Cutting apparatus for harvesters	400,489	Apr. 2	89	24	47	20
Robinson, Stillman W., Columbus, Ohio. Substructure for elevated railways	404,017	May 28	2196	577	47	1107
Robinson, Sylvanus E., Newark, N. J. Oven and flat-iron heater	401,909	Apr. 23	2343	608	47	473
Robinson, William, Chardan, Iowa. Shears for cutting metal bolts	403,961	May 28	2117	554	47	1092
Robson, W. O., *et al.* (See McKenney, Joel, assignor.)						
Rocheleau, John C., Worcester, Mass. Watch-maker's staking-tool	401,759	Apr. 23	2032	531	47	415
Rock, John C., near West Liberty, Ohio. Automatic gate	400,952	Apr. 9	794	212	47	161
Rockford Bolt Works. (See Mutimer, Frederick, assignor.)						
Rockwell, Frederick C., Hartford, Conn. Insulating pipe-coupling	400,600	Apr. 2	245	67	47	52
Rockwell, Frederick C., Hartford, Conn. Incandescent-lamp socket	402,481	Apr. 30	3141	813	47	633
Rodda, James. (See Bunce, Slate, and Rodda.)						
Rodenbaugh, Isaac N., *et al.* (See Frazer, Daniel A., assignor.)						
Rodenbaugh, Oscar S., *et al.* (See Frazer, Daniel A., assignor.)						
Rodenhausen, Leonard, Philadelphia, Pa. Dumping-wagon	402,034	Apr. 23	2448	637	47	492
Rodermond, Jacob, New York, N. Y. Ore-crusher	400,601	Apr. 2	246	67	47	52
Rodgers, Charles W. (See Abbott, Francis M., assignor.)						
Rodgers, James D., Georgetown, Ky. Fence	405,120	June 11	1086	289	47	1447
Rodgers, Richard H. (See Patric and Rodgers.)						
Röell, Cornelis F. A., London, England. Plaiting apparatus	401,214	Apr. 9	1182	315	47	233
Roelofs, Anthony, Philadelphia, Pa. Candlestick	401,592	Apr. 16	1762	464	47	354
Roeske, Henry, Philadelphia, Pa. Filter	402,543	Apr. 30	3227	836	47	650
Rogers, Asa L., *et al.* (See Servoss, Courtney S., assignor.)						
Rogers Car Axle Box Company. (See Rogers, Hamilton, assignor.)						
Rogers, Charles. (See Armstrong, Samuel, assignor.)						
Rogers, Charles D., assignor to American Screw Company, Providence, R. I. Blank-heading die	400,794	Apr. 2	546	150	47	105
Rogers, Charles D., assignor to American Screw Company, Providence, R. I. Nail, bolt, &c	405,681	June 18	1975	518	47	1629
Rogers, Frederick H., Los Angeles, Cal., assignor of one-half to C. C. Bell, Minneapolis, Minn. Photographic paper	402,279	Apr. 30	2818	729	47	573
Rogers, Freemon T., Linton, Ky. Car-coupling	400,490	Apr. 2	90	25	47	21
Rogers, George D., Minneapolis, Minn. Type setting and distributing machine	405,273	June 18	1331	351	47	1501
Rogers, Hamilton, assignor to Rogers Car Axle Box Company, Toledo, Ohio. Metal packing for car-axle boxes	403,141	May 14	875	231	47	836
Rogers, James S., Rockport, Mass. Elevator and conveyer	405,225	June 18	1404	370	47	1517
Rogers, Newton, and J. A. Wharry, Terre Haute, Ind. Dynamo-speeder for gas-engines	403,376	May 14	1257	332	47	906
Rogers, Newton, and J. A. Wharry, Terre Haute, Ind. Carburetor for gas-engines	403,377	May 14	1258	332	47	909
Rogers, Newton, and J. A. Wharry, Terre Haute, Ind. Governor for gas-engines	403,378	May 14	1261	333	47	909
Rogers, Newton, and J. A. Wharry, Terre Haute, Ind. Gas-engine	403,379	May 14	1262	333	47	910
Rogers, Newton, and J. A. Wharry, Terre Haute, Ind. Igniter for gas-engines	403,380	May 14	1264	333	47	910
Rogers & Pyatt. (See Pyatt, Runyon, Jr., assignor.)						
Rogers, Thomas A., Bloomdale, Ohio. Lead-binder	401,857	Apr. 23	2175	568	47	441
Rogers, Thomas J., Chicago, Ill. Oiling device for locomotive-axles	401,517	Apr. 16	1640	434	47	332
Rogers, William W., Clarksville, Ark. Car-coupling	402,973	May 7	609	160	47	779
Rogers, Wilson, Barboursville, W. Va. Machine for turning tenons	404,113	May 28	2366	620	47	1141
Rogers, Winfield S., and W. C. Jones, assignors to P. G. March, Cincinnati, Ohio. Ratchet-drill	401,375	Apr. 16	1433	378	47	293
Roggy, Josef, Saar Louis, Prussia, Germany. Coin-assorter	401,593	Apr. 16	1763	464	47	354
Rohm, James T., Locust Grove, Pa. Water-wheel	405,053	June 11	999	266	47	1431
Rohrer, Edmond C., and I. Joseph, Waco, Tex. Watch-case pendant	403,779	May 21	1852	486	47	1032
Roland Plow Works. (See Bowers, Marcus M., assignor.)						
Roller, Adie C., *et al.* (See Huyett, Miles C., assignor.)						
Rollins, George L. (See Gammons, Rollins, and Wadsworth.)						
Rollins, Jarrot L., Greenfield, Ill. Aseptic suit	405,850	June 25	2217	584	47	1692
Romain, Arnold, New Orleans, La. Passenger-register	402,035	Apr. 23	2149	638	47	492
Rood, John, assignor to Rood & Vaughan, Salem, Mass. Machinery for shaving or dressing green hides or skins	401,905	Apr. 23	2251	586	47	455
Rood & Vaughan. (See Rood, John, assignor.)						
Root Electric Gas Lighting Company. (See Root, Francis H., assignor.)						
Root, Francis H., Chicago, Ill., assignor to Root Electric Gas Lighting Company, of Illinois. Spark-coil	400,795	Apr. 2	547	151	47	105
Root, Henry, San Francisco, Cal. Machine for making wire rope	405,744	June 25	2076	544	47	1654
Root, Miles C., Toledo, Ohio. Wheel	404,657	June 4	427	107	47	1306
Roots, Francis T. (See Heinemann, Theodore P., assignor.)						
Roovers, Alfred W. (See Williams and Roovers.)						
Rorick, John C., Wauseon, Ohio. Truss	404,307	May 28	2673	693	47	1198
Rosa, Albert, assignor to J. A. Zinn, Milwaukee, Wis. Sad-iron	400,796	Apr. 2	549	151	47	105
Rose, Charles O., assignor of one-half to J. Heisler, Rochester, N. Y. Fire-escape	400,873	Apr. 2	665	181	47	127
Rose, Frank H., Syracuse, assignor to Valentine & Company, New York, N. Y. Sample of paints, &c	402,859	May 7	454	119	47	748
Rose, Henry C., Leadville, Colo. Fountain window-cleaner	403,218	May 14	1006	266	47	862
Rose, Israel M., Philadelphia, Pa. Lighting device	402,617	May 7	96	23	47	682
Rose, James M., Allegheny, Pa., assignor, by mesne assignments, to National Heat and Power Company, of New Jersey. Manufacturing gas	403,381	May 14	1266	333	47	910
Rose, James M., Allegheny, Pa., assignor, by mesne assignments, to National Heat and Power Company, of New Jersey. Manufacturing gas	403,382	May 14	1270	334	47	911
Rose, James M., Allegheny, Pa., assignor, by mesne assignments, to National Heat and Power Company, of New Jersey. Manufacturing gas	403,383	May 14	1273	334	47	911
Rose, James M., Allegheny, Pa., assignor, by mesne assignments, to National Heat and Power Company, of New Jersey. Apparatus for the manufacture of gas	403,384	May 14	1277	335	47	912

Rosenqvist, Conrad L., Yonkers, N. Y. Dynamo-electric machine or motor	405,602	June 18	1830	485	47	1604
Rosensteel, William W., Pittsburg, Pa. Ore-washer	403,488	May 14	1430	374	47	940
Rosenthal, August, Milwaukee, Wis. Combined feed-cutter and corn-husker	401,719	Apr. 16	1069	514 515	47	392
Rosenthal, Charles H., Cincinnati, Ohio, assignor of one-third to L. W. Wyler. Tool for removing shell-crowns from teeth	403,293	May 14	1128	299	47	883
Rosenthal, Eugene M., San José, Cal. Calculating-machine	401,463	Apr. 16	1567	414	47	318
Roshong, Isaiah. (See Roshong, Joseph and I.)						
Roshong, John J. (See Roshong, Joseph and I., assignors.)						
Roshong, Joseph and I., assignors of one-third to J. J. Roshong, Canton, Ohio. Eccentric oiler	401,072	Apr. 9	965	257	47	192
Ross, Abbott Q., Cincinnati, Ohio. Paper-roll holder	405,121	June 11	1086	289	47	1447
Ross, George B., Buffalo, N. Y. Combined syringe and medicine-case	400,491	Apr. 2	91	25	47	21
Ross, George W. (See White, Maurice W., assignor.)						
Ross, Henry S., New York, N. Y. Register	401,518	Apr. 16	1641	434	47	332
Ross, Henry S., New York, N. Y. Pipe-coupling	405,745	June 25	2078	545	47	1654
Ross, Leander F., Searcy, Ark. Bedstead-brace	405,603	June 18	1830	486	47	1604
Ross Sash Lock Company. (See Ross, Thomas B., assignor.)						
Ross, Simon, Jr., Linwood, Ohio. Sand-paper device	401,215	Apr. 9	1184	316	47	233
Ross, Thomas B., assignor to Ross Sash Lock Company, Evansville, Ind. Sash-fastener	405,396	June 18	1406	370	47	1517
Ross, Walter T., Quebec, Quebec, Canada. Thill-coupling	402,974	May 7	611	160	47	779
Rose, William, Troy, N. Y. Fluid-pressure regulator	404,503	June 4	203	49	47	1263
Rose, William, Troy, N. Y. Fluid-pressure regulator	404,504	June 4	206	49	47	1263
Rost, Henry. (See Hilderbrand, Rost, and Davis.)						
Rost, Max. (See Maul, Hermann, assignor.)						
Roth, Edward B., *et al.* (See Atwood, La Motte C., assignor.)						
Roth, Edward B., *et al.* (See Piggott, Henry E., assignor.)						
Roth, James D., Nazareth, Pa. Hub for vehicle-wheels	403,613	May 21	1606	422	47	983
Rothe, Morits. (See Schumacher, Daelen, and Rothe.)						
Rothschild, Abraham M., *et al.* (See Colby, Edward J., assignor.)						
Rothschild Brothers *et al.* (See Levy, William M., assignor.)						
Rotton, Otto, Brooklyn, N. Y. Gas or vapor burner for heating	400,602	Apr. 2	248	67	47	52
Round Valve Company. (See Reaser, Warren T., assignor.)						
Rounds, Alford A., Yankton, Dak. Ter. Washing-machine	403,614	May 21	1607	426	47	984
Rounds, Benjamin F., assignor of one-half to J. P. Bird, Kansas City, Mo. Artificial leg	403,142	May 14	876	231	47	836
Rounds, Benjamin F., assignor of one-half to J. P. Bird, Kansas City, Mo. Artificial leg	402,975	May 7	611	160	47	780
Rouse, Casper M., Le Roy, Kans. Combined riding harrow and roller	404,985	June 11	895	234	47	1409
Rousse, Auguste L., Fontenay-le-Comte, France. Lactometer	400,492	Apr. 2	92	25	47	21
Rousseau, David, New York, N. Y. Electric gas-lighting device	405,604	June 18	1831	486	47	1604
Rovello, Alberto, Turin, Italy. Production of copper by electrolysis	402,618	May 7	96	24	47	683
Rowell, Guilford D., Appleton, Wis. Feed-mill						
Royce, Charles. (See Miller, Charles W., assignor.)						
Royce, Wesley, *et al.* (See Abell, Robert T., assignor.)						
Royer, Charles L., Halifax, England. Machine for stretching leather	402,860	May 7	455	119 120	47	748
Royer, David H., Millmont, Pa. Car-coupling	400,797	Apr. 2	550	151	47	105
Roys, Fred. G., Morrice, Mich. Shipping-tag	403,780	May 21	1853	487	47	1032
Ru Ton, Hiram W. (See Gore and Ru Ton.)						
Rubin, Max, New York, N. Y. Shawl-strap	401,073	Apr. 9	966	257	47	193
Rudasill, Eli A., assignor of one-half to J. C. Beam, Shelby, N. C. Churn	402,976	May 7	613	161	47	780
Ruddell, Charles H., Terrell, Tex. Cultivator	404,437	June 4	91	23	47	1243
Ruddick, John J., Richmond, Ind., assignor, by mesne assignments, to Interstate Fire Alarm Company, Omaha, Nebr. Non-interfering fire-alarm signal-box	404,438	June 4	92	23	47	1243
Rudolfy, Josef, Szegedin, Austria-Hungary. Inhaler	404,986	June 11	896	235	47	1409
Ruffin, Mario C. A. (See Bang and Ruffin.)						
Rumsey, Arthur W., Kiowa, Kans. Clevis	400,493	Apr. 2	93	25	47	21
Rumsey, Charles B., assignor to Wire Fabric Company, Homer, N. Y. Positive shuttle-motion for looms	404,987	June 11	898	235 236	47	1410
Runyon, Edwin E., Mountain Spring, Tex. Needle-beam for bridges	400,874	Apr. 2	666	181	47	128
Runyon, Edwin E., Mountain Spring, Tex. Device for twisting wire cables of suspension-bridges	404,984	June 11	895	212	47	1394
Rupp, William F. (See Dunham, Charles L., assignor.)						
Ruppel, Henry, assignor to Dangler Stove and Manufacturing Company, Cleveland, Ohio. Safety oil-can attachment for vapor-stoves	404,439	June 4	95	24	47	1244
Rusbatch, Alfred, Cleveland, Ohio. Rod-coiling apparatus	405,433	June 18	1562	419	47	1548
Rush, James H., Boston, Mass. Speaking tube, pipe, &c	404,868	June 11	731	187	47	1376
Rush, Madison. (See Gildemeyer, Charles A., assignor.)						
Rushton, Thomas I. (See Flake, Gideon, assignor.)						
Russ, William V. (See Regan, Timothy, assignor.)						
Russell, Allen A., Indianapolis, Ind., assignor to Russell & Company, Massillon, Ohio. Straw-stacker	400,798	Apr. 2	551	131 132	47	105
Russell, Charles T., *et al.* (See Snee, William, assignor.)						
Russell, Charles W., and J. I. Drake, Providence, R. I. Device for supporting and operating electric lights	401,304	Apr. 9	1321	351	47	260
Russell & Company. (See Heggem, Charles O., assignor.)						
Russell & Company. (See Russell, Allen A., assignor.)						
Russell, Edward H., assignor to Russell Process Company, New Haven, Conn. Leaching ores with hyposulphite solutions	403,615	May 21	1608	.....	47	984
Russell, Edward H., assignor to Russell Process Company, New Haven, Conn. Leaching ores with hyposulphite solutions	403,616	May 21	1610	.....	47	984
Russell & Erwin Manufacturing Company. (See Burgess, Charles M., assignor.)						
Russell, George W., Mobeetie, Tex. Fly-trap	402,977	May 7	615	161	47	780
Russell, Oscar, *et al.* (See Knudsen, Andrew P., assignor.)						
Russell Process Company. (See Russell, Edward H., assignor.)						
Russell, Samuel T., Springfield, Ohio. Pump	403,962	May 28	2118	564	47	1092
Russell, William H., Vancouver, British Columbia, Canada, assignor of one-third to G. Robertson. Freight elevating and transporting apparatus	404,658	June 4	428	107	47	1308
Ruth, August, St. Louis, Mo. Manufacturing corn-cob pipes	401,464	Apr. 16	1569	415	47	318
Rutzler, Enoch. (See Cunningham, William F., assignor.)						
Ryan, James B., New York, N. Y. Woven-wire bed-bottom	403,143	May 14	877	231	47	836
Ryan, James R., Sault Ste. Marie, Mich. Snap-hook	401,305	Apr. 9	1322	351	47	260

Rymer, William, Detroit, Mich. Automatic railway-alarm apparatus	401,376	Apr. 16	1434	378 379	47	294
Rymer, William, Detroit, Mich. Whistle-actuating mechanism	401,377	Apr. 16	1438	380	47	294
Saarbach, Ludwig, New York, N. Y. Purifying tannic extracts	404,440	June 4	97	.....	47	1244
Saddlemyre, Ambrose L., assignor of one-half to A. Quay, Knox, N. Y. Weeding-machine	401,378	Apr. 16	1440	381	47	295
Sadgwar, Daniel A. (See Purdy and Sadgwar.)						
Sadler, Warren H. (See Davis and Marriott, assignors.)						
Safety Car Heating and Lighting Company. (See Bayles, James C., assignor.)						
Safety Car Heating and Lighting Company. (See Benjamin, George H., assignor.)						
Safety Hatch-Door Company. (See Herman, Emil J., assignor.)						
Sagendorph, Longley L., Cincinnati, Ohio. Lathing	404,227	May 28	2553	665 666	47	1176
Sagendorph, Longley L., assignor of one-half to H. P. Lloyd, Cincinnati, Ohio. Roller-die for stamping sheet metal	401,216	Apr. 9	1185	317	47	234
Sagendorph, Longley L., Cincinnati, Ohio, assignor of one-half to C. N. Harder, Philmont, N. Y. Metallic ceiling	401,906	Apr. 23	2253	586	47	456
Sagendorph, Longley L., Cincinnati, Ohio, assignor of one-half to C. N. Harder, Philmont, N. Y. Metallic roofing-plate	405,122	June 11	1088	290	47	1448
Sagendorph, Longley L., Cincinnati, Ohio, assignor of one-half to C. N. Harder, Philmont, N. Y. Metallic roofing-cleat	405,605	June 18	1834	486	47	1605
Sager, Marcus S., Washington Court-House, Ohio. Knockdown oven	402,978	May 7	615	161 162	47	780
Sager, Marcus S., Washington Court-House, Ohio. Gasoline-stove	405,274	June 18	1334	352	47	1502
Sager, Marcus S., Washington Court-House, Ohio. Gasoline-stove	405,275	June 18	1336	353	47	1502
Sale, Julian. (See Allen, Alexander, assignor.)						
Salmon, Joshua S. (See Stoops, William H., assignor.)						
Salmon, Samuel. (See Coxe and Salmon.)						
Salmon, Samuel, assignor to E. B. Coxe, Drifton, Pa. Hoisting apparatus for mines	404,935	June 11	825	212 213 214	47	1394
Saltmarsh, William H., and C. A. Bogardus, Chicopee Falls, Mass. Ring-spinning frame	401,217	Apr. 9	1187	317	47	234
Salzman, Christian H., Chicago, Ill. Grain-binder	403,385	May 14	1281	335 336	47	912
Salzwerk, Heilbronn. (See Buschmann, Friedrich, assignor.)						
Sammons, Jacob S., New York, N. Y. Store stool or chair	401,379	Apr. 16	1442	381	47	295
Sammons, Jacob S., New York, N. Y. Store-stool	401,380	Apr. 16	1444	381	47	295
Sampson, Clara E. (See Wright, Pliny J., assignor.)						
Sampson, Thomas H., New Orleans, La. Preserving lumber	403,144	May 14	877	231 232	47	837
Sampson, Truman M., Burlington, Iowa. Barbed-wire-fence gate	403,219	May 14	1008	266	47	862
Sanders, Eliza. (See Sanders, Louis, assignor.)						
Sanders, George A. (See Newman, Nelson, assignor.)						
Sanders, Louis, assignor, by mesne assignments, to E. Sanders, Brooklyn, N. Y. Supporter for belts	403,220	May 14	1009	267	47	862
Sanders, Newell, and J. Buchanan, Chattanooga, Tenn. Feed-regulator	402,979	May 7	617	162	47	780
Sanderson, Herbert H., trustee. (See Mason, Allan, assignor.)						
Sands, Josias J., Merton, Wis. Bottle-stopper holder	403,076	May 7	773	204	47	808
Sands, Josias J., Merton, Wis. Bottle-stopper	404,799	June 4	623	160	47	1347
Sands, William B. O., *et al.* (See Flood, George W., assignor.)						
Sandwell, William D., London, England. Electric motor for tramway-vehicles	401,970	Apr. 23	2344	609 610	47	474
Sandwell, William D., Herne Hill, county of Surrey, England. Dynamo-electric machine	405,507	June 18	1691	447	47	1575
Sanford, John L., assignor of one-half to J. F. Stephenson, Albany, N. Y. Wick-trimmer	404,736	June 4	527	135	47	1338
Sanford, Laura P., New York, N. Y. Book-binding	405,276	June 18	1337	353	47	1502
Sanford, Perry T., New Haven, Conn. Turbine water-motor	404,869	June 11	733	187	47	1376
Sangerhäuser Actien-Maschinen-Fabrik and Eisengiesserei, vormals Hornung & Rabe. (See Rabe, Carl, assignor.)						
Sangston, Allan T., Philadelphia, Pa. Nut-lock	403,386	May 14	1283	336	47	912
Sanitary and Fertilizer Company of the United States. (See McClellan, Oscar D., assignor.)						
Sardy, Coles & Co. (See Chapman, Charles A., assignor.)						
Sardy, John L., New York, N. Y. Head-band for surgical mirrors	402,619	May 7	99	24	47	683
Sargent, Charles E., Utica, N. Y. Type-writing machine	405,606	June 18	1835	487	47	1605
Sargent & Company. (See Wright, Granville W., assignor.)						
Sargent, Frederick G., Graniteville, Mass. Cone-duster for fibrous substances	400,953	Apr. 9	795	212 213	47	102
Sargent, Ransom H., assignor of one-fourth to J. L. Dunn, Titusville, Pa. Oil and gas burner	403,447	May 14	1366	359	47	928
Saunders Car Axle Lubricator Company. (See Saunders, Theodore, assignor.)						
Saunders, Theodore, assignor to Saunders Car Axle Lubricator Company, Danbury, Conn. Car-axle lubricator	403,448	May 14	1367	359	47	929
Saurer, Adolph, and E. Leuthold, St. Gallo, Switzerland. Embroidering-machine	403,221	May 14	1010	267 268	47	863
Savage, Watson L. (See Bedford, George P., assignor.)						
Savene, John W., Toledo, Ohio. Metal wheel	405,327	June 18	1407	371	47	1517
Sawyer, Andrew J., New Market, N. H. Dental plugger	405,123	June 11	1089	290	47	1448
Sawyer, Charles H., assignor of one-half to H. A. Smith, Minneapolis, Minn. Wheeled scraper	401,907	Apr. 23	2254	587	47	456
Sawyer, Orren A., and M. M. Lahue, Lowell, Mass. Shuttle checking and relieving mechanism for looms	405,913	June 25	2318	609	47	1609
Sawyer, Uriah P., assignor of one-half to J. A. Dollar, Camilla, Ga. Pump	403,077	May 7	774	205	47	808
Sayles, Elizabeth A. (See Stearns, Elvira, assignor.)						
Scanland, Albert T., Dunn Loring, Va. Ironing-board	401,858	Apr. 23	2176	568	47	441
Scarles, Benjamin, assignor to Clinton Wire Cloth Company, Clinton, Mass. Wire-fence fabric	400,954	Apr. 9	797	213	47	102
Schaff, Amos J., assignor of one-half to W. R. Early, Marion, Pa. Rail-joint	404,308	May 28	2674	693	47	1198
Scharnweber, William, assignor of two-thirds to H. N. Mann and R. J. Killick, Chicago, Ill. Box-cover	401,660	Apr. 16	1883	490	47	375
Schaubel, Henry, assignor of one-half to H. W. Miller, Jr., Philadelphia, Pa. Boiler-tube fastening	405,225	June 11	1253	332	47	1479
Schaubel, Henry, assignor of one-half to H. W. Miller, Jr., Philadelphia, Pa. Fastening boiler-tubes	405,226	June 11	1253	332	47	1479
Schaubel, Henry, assignor of one-half to H. W. Miller, Jr., Philadelphia, Pa. Boiler-stay	405,227	June 11	1254	333	47	1479

Smith, William F., and A. B. Catterall, Syracuse, N. Y. Skirt-protector	401,052	Apr. 9	974	260	47	191
Smith, William H., Hickman, Tenn. Heating and steaming grain	404,571	June 4	308	73	47	1289
Smith, William J., Chicago, Ill., assignor to Smith Feed Water Heater and Purifier Company, St. Louis, Mo. Feed-water purifier	402,199	Apr. 30	2701	701 702	47	551
Smith, Wilson R., assignor of two-thirds to J. Goss and A. C. Hutchison, Beloit, Wis. Wrench	403,895	May 21	2022	532	47	1065
Smyth, David M., Hartford, Conn. Machine for gathering signatures	404,119	May 28	2374	622 623	47	1143
Smyth, William H., Berkeley, Cal. Machine for heading cans	403,784	May 21	1856	488 489 490	47	1033
Snavely, Benjamin F., Harrisburg, Pa. Water-proof air-mattress	402,992	May 7	634	168	47	783
Snead, Udolpho, Louisville, Ky. Pole for electric wires	401,532	May 28	2658	667	47	1177
Snedeker, Charles T., New York, N. Y. Grip-car	402,361	Apr. 30	2944	763	47	596
Snee, William, assignor of part to W. Smith, Pittsburg, C. T. Russell, Allegheny, and W. Guckert, Pittsburg, Pa. Steam-generator	404,740	June 4	532	136	47	1329
Snee, William, Pittsburg, assignor to C. T. Russell, Allegheny, W. Guckert, and W. Smith, Pittsburg, Pa. Hydrocarbon-burner	404,804	June 4	629	161	47	1349
Snow, Everett J., Penobscot, Me. Sheet-music support for piano-fortes	401,662	Apr. 16	1885	481	47	376
Snow, Harry L., Reseaville, Wis. Printing-machine	404,058	May 28	2370	596 597	47	1123
Snow, William W. (See Hollister, William H., assignor.)						
Snyder, Daniel J., and J. Stephenson, Scio, Ohio. Apparatus for carbureting air or gas	405,747	June 25	2060	545 546	47	1654
Snyder, Frederick, Lancaster, Pa. Letter-box alarm	402,282	Apr. 30	2932	730	47	573
Snyder, John R., and J. Deets, Agency, Mo. Reverse-link for steam-engines	400,960	Apr. 9	806	215	47	164
Snyder, Judson S., Brooklyn, N. Y. Bathing-mitten	405,896	June 25	2155	566	47	1670
Société Armand Schwab et Frère. (See Rime, Hugues, assignor.)						
Société Industrielle des Glycerine et Acides Gras. (See Marix, Paul, assignor.)						
Society of Chemical Industry. (See Kussmaul, Carl, assignor.)						
Society of Chemical Industry. (See Schmid, Jakob, assignor.)						
Society of Chemical Industry of Basle. (See Gnehm, Robert, assignor.)						
Sohst, Henry F. W., San Francisco, Cal. Feathering paddle-wheel	403,392	May 14	1292	338	47	914
Solano, Renaldo, assignor of three-fourths to J. W. Howard, D. R. Morse, Brooklyn, N. Y., and L. G. Fisher, Chicago, Ill. Air-brake operating and reducing valve	405,854	June 25	2222	585	47	1663
Solano, Renaldo, assignor of three-fourths to J. W. Howard, D. R. Morse, Brooklyn, N. Y., and L. G. Fisher, Chicago, Ill. Automatic air-brake	405,855	June 25	2223	585	47	1663
Solano, Renaldo, assignor of two-thirds to J. W. Howard and D. R. Morse, Brooklyn, N. Y. Automatic air-brake	406,006	June 25	2475	647	47	1725
Soltmann, Edward G., New York, N. Y. Tape-measure	400,961	Apr. 9	808	215	47	164
Somers, George E., Bridgeport, Conn., assignor to Bridgeport Brass Company, of Connecticut. Shade-holder	401,910	Apr. 23	2250	588	47	457
Somersworth Machine Company. (See Langlands and Moulton, assignors.)						
Sommerfeld, Heinrich, Canton, assignor to A. Ehrlich, Lehigh, Kans. Churn	404,443	June 4	100	25	47	1245
Sonnenberg, Michael. (See Barton, Richard T., assignor.)						
Soper, Samuel H., Jr., Brighton, county of Sussex, England, assignor to W. S. Lamson, Windham, N. H. Cash-carrier	403,967	May 28	2126	556	47	1093

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Souders, Addison J., Brimfield, assignor to D. Hart, Springfield, Ohio. Lifting-jack	401,865	Apr. 23	2184	570	47	443
Southard, Hannah, *et al.* (See Southard, Stephen P., assignor.)						
Southard, Stephen P., assignor to C. C. Post, Geneva, and H. Southard, Waterloo, N. Y. Sulky	405,856	June 25	2226	586	47	1684
Southworth, Horatio W., Springfield, Mass. Stationery-packet	403,185	May 21	1864	490	47	1035
Spall, Charles R., and E. Scoones, London, England. Glove	405,380	June 18	1481	[illegible]	47	1532
Spangler, Franklin P., Goshen, Ind. Broadcast seeder	402,993	May 7	635	166	47	784
Sparks, Charles, Sacramento, Cal. Strap fastener and tightener for trunks, &c	402,776	May 7	337	87	47	736
Sparks, William A., assignor to Stein Manufacturing Company, Rochester, N. Y. Coffin-fastener	401,663	Apr. 16	1886	491	47	370
Spaulding, Almon M., Grand Rapids, Mich. Stove for railway-coaches	406,007	June 25	2457	647	47	1726
Spaulding, Mont, Orleans, Mich. Corn-shock binder	405,612	June 18	1845	488	47	1606
Spear, Murray H., London, England. Ruling device	404,315	May 28	2684	[illegible]	47	1200
Speed, Francis M., San Francisco, Cal. Electric railway	403,160	May 21	1865	490	47	1035
Speed, Joseph J., Waltham Cross, England. Sight for fire-arms	400,715	Apr. 2	418	113	47	83
Speicher, John, Jersey City, assignor to F. T. Feary, Newark, N. J. Railway-joint	402,777	May 7	338	87	47	736
Spence, James H., Milwaukee, Wis. Water-back	402,994	May 7	636	166	47	784
Spencer, Charles F., assignor to H. S. Hanford, Rochester, N. Y. Package-fastener	405,685	June 18	1961	513	47	1630
Spencer & Co., J. L. (See Kennedy, John H., assignor.)						
Spencer, Frederick, Sterling, Ill. Seesaw	401,798	Apr. 23	2098	548	47	426
Spencer, William L., Clinton, Iowa. Calf-feeder	400,902	Apr. 9	800	210	47	164
Sperry, Alfred W., Hartford, Conn. Pessary	404,019	May 28	2200	577	47	1107
Sperry Electric Company. (See Sperry, Elmer A., assignor.)						
Sperry Electric Mining Machine Company. (See Sperry, Elmer A., assignor.)						
Sperry, Elmer A., Chicago, Ill. Electric-arc lamp	405,440	June 18	1576	[illegible]	47	1551
Sperry, Elmer A., assignor to Sperry Electric Mining Machine Company, Chicago, Ill. Electric drilling-machine	405,187	June 11	1194	319	47	1468
Sperry, Elmer A., assignor to Sperry Electric Mining Machine Company, Chicago, Ill. Electric mining-machine	405,188	June 11	1197	319	47	1468
Sperry, Elmer A., assignor to Sperry Electric Company, Chicago, Ill. Dynamo	405,441	June 18	1579	417	47	1552
Sperry, Ezra F. (See Cook, Sidney, assignor.)	405,613	June 18	1846	489	47	1607
Sperry, Norman, Seymour, Conn. Package for auger-bits	400,963	Apr. 9	810	215	47	165
Spicer, John H., Harrisburg, Pa. Coffin-plate	400,608	Apr. 2	256	70	47	54
Spielman, George D., Cincinnati, Ohio. Button-hole attachment for sewing-machines						
Spikins, Charles, *et al.* (See May, Isaac, assignor.)						
Spikins, Thomas, *et al.* (See May, Isaac, assignor.)	400,716	Apr. 2	418	[illegible]	47	83
Spiro, Charles, New York, N. Y. Type-writing machine	404,572	June 4	310	79	47	1284
Spiro, Simon, Birmingham, Ala. Water-heater						
Spivey, Thomas S. (See Bryant, Andrew J., assignor.)						
Spooner, Frederick B., Brooklyn, N. Y. Clasp. (Reissue)	10,995	Apr. 16	1985	510	47	396
Spooner, Frederick B., Brooklyn, N. Y. Clasp	401,977	Apr. 23	2353	602	47	475
Sprague, Almerin R., Racine, Wis. Ink-well	405,921	June 25	2331	612	47	1701
Sprague, Edwin L. (See Peare, George R., assignor.)						
Sprague, James K., Chicago, Ill. Transom-lifter	404,020	May 28	2201	578	47	1107
Sprague, Samuel H., Beloit, Kans. Fire-escape	401,508	Apr. 16	1783	468	47	357
Spratt, Charles, New Cross Gate, county of Kent, England. Speed-indicator	404,992	June 11	904	[illegible]	47	1411
Spring, Charles A. (See Springer and Spring.)						
Springer, David, and C. A. Spring, Royer's Ford, Pa. Heater for railway-cars	404,316	May 28	2684	696	47	1200
Springfield Bicycle Manufacturing Company. (See Haynes, Gideon, Jr., assignor.)						
Springstead, Abram B., Kalamazoo, Mich. Work-feeder for band-saws	403,618	May 21	1614	427	47	985
Spruce, James, and A. M. Comstock, Waterbury, Conn. Spring-hinge	401,978	Apr. 23	2355	613	47	476
Spugie, G. W., *et al.* (See Putnam, William W., assignor.)						
St. John, Roswell H., Cleveland, Ohio. Case for carrying phonograms and graphograms, &c	402,997	May 7	641	169	47	785
St. John, Spencer H., Chicago, Ill. Pinch-bar	400,964	Apr. 9	811	216	47	165
St. Louis Dead Lock Company. (See Martin, John W., assignor.)						
St. Pierre, Charles D., Brooklyn, N. Y. Shoe-blacking	401,390	Apr. 16	1457	[illegible]	47	298
Stafford, George W., Postville, Iowa. Pump	401,979	Apr. 23	2356	613	47	476
Stafford Manufacturing Company, George W. (See Sharples, William E., assignor.)						
Stagg, Harrison, near Valencia, Kans. Cultivator	401,468	Apr. 16	1574	416	47	319
Stahl, Charles H., and J. W. Bonton, Bridgeport, Conn. Corset-clasp	405,442	June 18	1579	417	47	1552
Stahlhuth, Ernst H. W. and H. W., Cincinnati, Ohio. Extension-table	401,310	Apr. 9	1327	353	47	361
Stahlhuth, Henry W. (See Stahlhuth, Ernst H. W. and H. W.)						
Staib, Gustav, Tompkinsville, N. Y. Cover for fruit-jars	404,059	May 28	2280	597	47	1124
Stairs, John F. W., Halifax, Nova Scotia, Canada. Oiler	405,922	June 25	2332	612	47	1701
Staley, James M. (See Hersh and Staley.)						
Stamm, August, New York, N. Y. Sheet-metal box	405,443	June 18	1580	417	47	1552
Standard Electrical Works. (See Kinsley, Isaac, assignor.)						
Standard Wagon Company. (See Hawes, William L., assignor.)						
Stanley, Frank F., *et al.*, trustees. (See Geddu, Louis, assignor.)						
Stanley, Frank F., Swampscott, Mass. Leather-splitting machine. (Reissue)	11,008	June 18	1982	519	47	1630
Stanley, Frank P., Spencer, Iowa. Clothes-line	400,563	Apr. 2	111	30	47	25
Stanley, Lucius T., Brooklyn, assignor to D. L. Proudfit, New York, N. Y. Device for testing color-blindness	404,366	May 28	2765	716	47	1216
Stanley, Reginald, Nuneaton, county of Warwick, England. Brick-kiln	402,628	May 7	110	27	47	685
Stanley Rule and Level Company. (See Bailey, Frank M., assignor.)						
Stanley Rule and Level Company. (See Trant, Justus A., assignor.)						
Stanley, William, Jr., Great Barrington, Mass., assignor to Westinghouse Electric Company, Pittsburg, Pa. Regulating self-exciting alternate-current electric generators	404,120	May 28	2377	623	47	1144
Stanley, William F., South Norwood, county of Surrey, England. Machine for measuring the height of human bodies automatically	404,317	May 28	2685	[illegible]	47	1200
Stanley Works. (See Holland, Franklin, assignor.)						
Stansbrough, Wilson Y., Brooklyn, N. Y. Gas-meter	403,297	May 14	1133	300	47	884
Stanton, Edmund C. (See Stewart, James, assignor.)						
Stanynought, Harry, Elizabeth, N. J. Door-check	403,393	May 14	1294	338	47	914
Stapleton, James, St. Louis, Mo. Smoke-consuming boiler-furnace	402,302	Apr. 30	2946	764	47	506
Star Iron Tower Company. (See O'Beirne, William H., assignor.)						
Star Manufacturing Company. (See Scott, Samuel P., assignor.)						
Starbuck, Robert P., Harrisville, W. Va. Washing-machine	405,807	June 25	2155	567	47	1670

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Stark, Abraham H., Belleville, Kans. End-gate	402,111	Apr. 23	2369	667	47	518
Starks, Nils O., Madison, Wis. Corn-planter	404,318	May 28	2698	[illegible]	47	1201
Stasser, Virgil A., Haines City, Fla. Hand-car	401,469	Apr. 16	1577	417	47	320
Statter, John G., London, county of Middlesex, England. Pole-piece for dynamo-electric machines	402,200	Apr. 30	2703	[illegible]	47	551
Staub, Alexander, Fort Wayne, Ind. Stove-pipe thimble	402,778	May 7	339	87	47	736
Stead, Eldred W., Stoke Newington, county of Middlesex, assignor to R. Leca, Crewe, county of Chester, England. Last	400,876	Apr. 2	669	169	47	128
Steam Gauge and Lantern Company *et al.* (See Betts, Lewis F., assignor.)						
Steam Gauge and Lantern Company. (See Gall, John S., assignor.)						
Steam Gauge and Lantern Company. (See Glasier, Elias C., assignor.)						
Steam Gauge and Lantern Company. (See Wright, Frederick K., assignor.)						
Stearns & Co., Edward C. (See Stearns, Edward C., assignor.)						
Stearns, Edward C., assignor to E. C. Stearns & Co., Syracuse, N. Y. Drill-press	404,367	May 28	2706	717	47	1216
Stearns, Edward C., assignor to E. C. Stearns & Co., Syracuse, N. Y. Clamp	404,368	May 28	2707	717	47	1216
Stearns, Elvira, assignor of one-half to E. A. Sayles, Providence, R. I. Garment-measuring device and cutting-guide	405,614	June 18	1846	489	47	1607
Stearns, Otis W., Johnson, Vt. Combined block barbing and splitting machine	401,868	Apr. 23	2125	571	47	443
Stebbins, Henry W., Monico, Wis. Paper-pulp digester	405,279	June 18	1740	354	47	1503
Steddom, Henry, Jr., Oaksloosa, Iowa. Wire-weaving apparatus	404,444	June 4	100	25	47	1245
Stedman, Oscar F., Ravenna, Ohio. Stem winding and setting watch	403,787	May 21	1866	490	47	1035
Steele, Edwin B., Adrian, Mich. Adjustable derrick	402,201	Apr. 30	2708	703	47	552
Steele, James W., Topeka, Kans., assignor of one-half to A. McNally, Chicago, Ill. Danger-signal for railway-bridges	401,763	Apr. 23	2037	[illegible]	47	416
Steele, James W., Topeka, Kans., assignor of one-half to A. McNally, Chicago, Ill. Danger-signal for railway-bridges	401,764	Apr. 23	2039	533	47	416
Steele, James W., Topeka, Kans., assignor of one-half to A. McNally, Chicago, Ill. Danger-signal for railway-bridges	401,799	Apr. 23	2099	548	47	426
Steele, James W., Topeka, Kans., assignor of one-half to A. McNally, Chicago, Ill. Danger-signal for railway-bridges	401,800	Apr. 23	2100	549	47	427
Steele, Wilbur F., Steele, Dak. Ter. Water-gas burner	402,995	May 7	637	169	47	784
Steele, Wilbur F., Steele, Dak. Ter. Vapor-burner	402,996	May 7	639	169	47	784
Steele, William D., assignor of one-half to J. E. Ward, Huron, Dak. Ter. Corn-harvester	402,040	Apr. 23	2461	641	47	495
Steen, James B., Fidelity, Ohio. Machine for making fences	405,510	June 18	1694	448	47	1576
Steenbergh, George C., Syracuse, N. Y. Railway-track instrument	401,664	Apr. 16	1897	492	47	376
Steenbergh, George C., Syracuse, N. Y. Switch-instrument for railway-signals	403,619	May 21	1016	422	47	986
Steffen, Carl, Vienna, Austria-Hungary. Lixiviating-battery for raw sugar	403,788	May 21	1867	491	47	1036
Stein Manufacturing Company. (See Sparks, William A., assignor.)						
Steinbach, Gustav H., Lichtenstein, Saxony, Germany. Apparatus for coupling vessels	404,993	June 11	908	240	47	1411
Steindecker, Josef. (See Dollinger, Gustav J., assignor.)						
Steinecke, Reinhold, New York, N. Y. Nested boxes	402,856	May 7	460	122	47	750
Steiner, Henry W., Easton, Pa. Weather-strip and door-sill combined	405,808	June 25	2156	567	47	1670
Steiner, Martin, Erie, Pa. Ice-creeper	405,381	June 18	1483	393	47	1532
Steinhoff, Alexander, Briesnitz, near Dresden, Saxony, Germany. Electrically-controlled apparatus for treating emphysema	402,779	May 7	340	88	47	736
Steinle, William M., Pittsburg, assignor of one-half to J. Bowman, Allegheny, Pa. Cigar-making machine	401,599	Apr. 16	1784	[illegible]	47	358
Steinmann, Frank, St. Louis, Mo. Steam pumping-engine	400,877	Apr. 2	670	[illegible]	47	128
Stephenson, James. (See Snyder and Stephenson.)						
Stephenson, John, New York, N. Y. Brake-shoe for car-tracks	403,229	May 14	1025	270	47	885
Stephenson, John, New York, N. Y. Car-truck brake	403,298	May 14	1135	300	47	885
Stephenson, John, New York, N. Y. Track-brake for cars	403,299	May 14	1136	301	47	885
Stephenson, John, New York, N. Y. Car-track-brake housing	403,300	May 14	1137	301	47	886
Stephenson, John, New York, N. Y. Draw-gear for cable cars	403,301	May 14	1139	301	47	886
Stephenson, John, New York, N. Y. Car-truck guard	403,302	May 14	1140	302	47	886
Stephenson, John, New York, N. Y. Cable-grip carrier	403,303	May 14	1141	[illegible]	47	887
Stephenson, John, New York, N. Y. Cable-car truck	403,304	May 14	1294	339	47	915
Stephenson, John, New York, N. Y. Cable-grip car	403,305	May 14	1297	339	47	915
Stephenson, John F. (See Sanford, John L., assignor.)						
Sterick, Sylvester T. F., Gaithersburg, Md., assignor of two-thirds to M. V. Tierney and L. C. Wood, Washington, D. C. Game-board	402,112	Apr. 23	2570	667	47	516
Sternbergh, James H., Reading, Pa. Screw-cutting machine	401,600	Apr. 16	1791	470	47	359
Sternbergh, James H., and R. Pemberton, Reading, Pa.; said Pemberton assignor to said Sternbergh. Screw-cutting machine	401,601	Apr. 16	1794	470	47	360
Stettheimer, Jacques R., assignor of one-half to W. N. Oothout, Rochester, N. Y. Fan attachment	402,283	Apr. 30	2824	730	47	574
Stewart, William F., Blackbanks, St. Simon's Island, Ga. Oyster-opener	402,867	May 7	470	123	47	750
Stevens, Abram W. and L. W., W. M. Brinkerhoff, and L. D. Swart, assignors to A. W. Stevens & Son, Auburn, N. Y. Spring harrow-tooth	405,923	June 25	2333	613	47	1702
Stevens, Benjamin D., Burlington, Vt. Lamp-extinguisher	401,896	May 21	2022	532	47	1065
Stevens, Benjamin D., assignor of one-half to T. S. Peck, Burlington, Vt. Planing-machine	405,280	June 18	1342	354	47	1503
Stevens, Irving D. (See Eberhart and Stevens.)						
Stevens, Joel W., assignor to himself and R. Bines, Chicago, Ill. Apparatus for feeding boilers or water-tanks	405,615	June 18	1848	489	47	1607
Stevens, Le Roy W. (See Stevens, Brinkerhoff, and Swart.)						
Stevens, Philo M., Toledo, Ohio. Hose-coupling	405,748	June 25	2081	546	47	1655
Stevens & Son, A. W. (See Stevens, Brinkerhoff, and Swart, assignors.)						
Stevens, Vernon R., Bridgeport, Conn. Pipe-cutter	401,387	Apr. 16	1452	383	47	297
Stevens, William N. (See Mitchell and Stevens.)						
Stevens, William X., Washington, D. C. Automatic switch	400,802	Apr. 2	558	153	47	107
Stevenson, George H. (See Baldwin, George W., assignor.)						
Steward, Aurelius. (See Dial, Steward, and Dimond.)						
Steward, John F. (See Kennedy and Steward.)						
Steward, John F., Chicago, Ill. Corn-harvesting machine	401,388	Apr. 16	1453	384	47	297
Steward, John F., Chicago, Ill. Harvester-reel	401,665	Apr. 16	1888	492	47	376
Stewart, Archibald, Keota, Iowa. Scraper	401,911	Apr. 23	2260	588	47	457
Stewart, Archibald, Keota, Iowa. Grain-meter	403,396	May 14	1298	340	47	916
Stewart, Charles. (See Bradsby, William B., assignor.)						
Stewart, James, assignor of one-half to E. C. Stanton, New York, N. Y. Incandescent lamp	403,397	May 14	1300	340	47	916
Stewart, John A. (See Tebbetts, Pope, and Stewart.)						
Stewart, R. Hays, and L. D. Chambers, Island, Pa. Stop-plate for buggies	401,692	Apr. 16	1796	471	47	360

Stollwerck, Heinrich, assignor to Gebr. Stollwerck, Cologne-on-the-Rhine, Prussia, Germany. Preparing soluble cocoa	401,311	Apr. 9	1328	.....	47	261
Stoltze, Henry, Sr., Manitowoc, Wis. Apparatus for raising quicksand	404,741	June 4	533	137	47	1329
Stone, David K., assignor of one-half to A. Taylor, Bloomingdale, Mich. Thill-coupling	400,578	Apr. 2	672	183	47	129
Stone, George W., Jr., Waukesha, Wis. Locomotive-cab seat	404,662	June 4	434	109	47	1309
Stone, Jabez, Waterford, N. Y. Adjustable multiple-cutter boring-bar	403,154	May 14	894	236	47	840
Stone, James, *et al.* (See Gardner, Marshall, assignor.)						
Stone, John W., and A. Colman, assignors of one-third to E. Baker, St. Lawrence, Dak. Ter. Kitchen-cabinet and flour-chest	402,113	Apr. 23	2572	667	47	516
Stone, Joseph, Boston, assignor to Nelson Chemical Company, Newton, Mass. Bottle	402,042	Apr. 23	2461	642	47	495
Stone, Maynard L. (See Stone, Roscoe G., assignor.)						
Stone, Oron. (See Ransom, Ezra, assignor.)						
Stone, Roscoe G., assignor of one-half to M. L. Stone, Warwick, R. I. Wagon-seat	401,079	Apr. 9	975	259	47	194
Stoner, Riley. (See Beebe and Stoner.)						
Stong, John N., Woodbridge, Ontario, Canada. Mechanism for opening gates	402,998	May 7	642	170	47	785
Stoops, William H., assignor to J. S. Salmon, Boonton, N. J. Sealed lock for cans	400,505	Apr. 2	112	30	47	26
Storie, James D., Oshawa, Ontario, Canada. Feed mechanism for chain-link machine	404,742	June 4	534	137	47	1330
Storie, Ole O., Milwaukee, Wis., assignor of one-half to J. H. Gordon, Rochester, N. Y. Grain-binder	404,508	June 4	212	50, 51	47	1264
Story, William S. (See Shepherd and Holmes, assignors.)						
Stouffer, Hiram C., assignor of one-half to E. Blunt, Mineral Ridge, Ohio. Pick	400,803	Apr. 2	560	153	47	107
Stouffer, Joseph W. (Stouffer, Luther, assignor.)						
Stouffer, Luther, assignor of two-fifths to J. W. Stouffer, St. Joseph, Mo. Vehicle-spring	400,506	Apr. 2	114	30	47	26
Stout, Isaac, Mackinaw, Ill. Car-coupling	404,743	June 4	539	138	47	1331
Stover, Cochran C., Bradford, Pa. Well-pumping rig	404,744	June 4	540	139	47	1331
Stowell, Theodore B. (See Lafloe, Edward, assignor.)						
Strachan, Joseph, Brooklyn, N. Y. Combined tobacco-tamp and pipe-stem cleaner	400,966	Apr. 9	813	216	47	165
Strader, Julius G., assignor of two-thirds to W. N. Page and D. T. Evans, Powellton, W. Va. Nut-lock	403,968	May 28	2127	557	47	1094
Stranahan, Henry B., Cleveland, Ohio. Stamping-press	402,929	May 7	643	170	47	785
Strange, Edwin F., assignor of one-half to E. W. Strange, Taunton, Mass. Truck	401,470	Apr. 16	1577	417	47	320
Strange, Elias W. (See Strange, Edwin F., assignor.)						
Strasser, John, assignor of one-half to D. C. Taylor, Manchester, Mo. Current-wheel	403,493	May 14	1437	378	47	942
Strater, Francis A., Boston, Mass. Drain for sinks, wash-bowls, &c.	404,060	May 28	2281	597	47	1121
Straton, James. (See Gillett, Webster, assignor.)						
Straub, Alfred H. F., Los Angeles, Cal. Steam-engine	404,573	June 4	311	78	47	1294
Straub, Ambrose W., Philadelphia, Pa. Sub-river tunnel	400,804	Apr. 2	561	153	47	107
Straub, Frederic, Surprise, Nebr. Storm-sash ventilator	405,189	June 11	1200	319	47	1469
Stranch, Albert T., New York, N. Y. Repeating-action for grand pianos	404,856	June 11	741	189	47	1378
Straumann, Charles, Jersey City, N. J. Operating mechanism for the cloth-beams of looms	400,879	Apr. 2	672	184	47	129
Strans, Aaron. (See Gracey and Keech, assignors.)						
Straus, Aaron, and M. B. Jacoby, St. Louis, Mo.; said Jacoby assignor to said Straus. Chair attachment	405,919	June 25	2329	612	47	1701
Strauss, Carl, New York, N. Y. Scarf-fastener	402,868	May 7	471	123	47	750
Street, Thomas, assignor to himself and E. Whitlock, Richmond, Va. Trolley for electric railways	403,969	May 28	2128	557	47	1094
Strebig, John P., Philadelphia, Pa. Gage-cock	405,129	June 11	1096	292	47	1449
Street, Samuel T., Deposit, N. Y. Railway-signal	400,580	Apr. 2	674	184	47	129
Streeter, Daniel A., Waterbury, Conn. Pipe-laying apparatus	400,881	Apr. 2	675	184	47	129
Streeter, Sumner F., Greenfield, Mass. Spring-hinge	403,494	May 14	1438	378	47	942
Strickland, James. (See Greenway and Strickland.)						
Strickler, William H., and J. S. Braddock, Mount Pleasant, Pa. Motor for churns	400,507	Apr. 2	115	30	47	26
Stringer, John W., Marion, Ohio. Reversing mechanism for engines	400,865	Apr. 2	565	155	47	108
Stringer, John W., Marion, Ohio. Gearing for road-engines	403,000	May 7	644	170	47	785
Strom, Axel A., Austin, assignor to Strom Manufacturing Company, Chicago, Ill. Switch-rail chair	401,312	Apr. 9	1329	253	47	262
Strom, Axel A., Austin, assignor to Strom Manufacturing Company, Chicago, Ill. Lifting-jack	401,722	Apr. 16	1973	516	47	393

Strom, Axel A., Austin, assignor to Strom Manufacturing Company, Chicago, Ill. Tie-bar clip for split switches	406,008	June 25	2479	648	47	1798
Strom Manufacturing Company. (See Strom, Axel A., assignor.)						
Stromberg, Alfred, assignor to Western Electric Company, Chicago, Ill. Telephone-switch	405,382	June 18	1483	393	47	1533
Stromberg, William. (See Hotchkiss, Edward, assignor.)						
Strong, Frederick S., assignor to Carver Cotton Gin Company, East Bridgewater, Mass. Sole-leveling machine	403,495	May 14	1439	377	47	942
Strong, George S., New York, N. Y. Making car-wheels	402,696	May 7	212	55	47	730
Strong, John A., Caln, Kans. Box-fastener	403,398	May 14	1301	340	47	916
Strother, Rolland G., Findlay, Ohio. Grain-drill	402,697	May 7	213	56	47	703
Stroud, Wiley N., Waxahachie, Tex. Wheel	401,060	Apr. 9	976	260	47	195
Stuart, John. (See Schröder, Heinrich L. H., assignor.)						
Stuart, John M., Boston, Mass. Annunciator-drop	402,043	Apr. 23	2463	642	47	495
Stuart, Sinclair, Plainfield, N. J. Separator	403,704	May 21	1739	457	47	1011
Stuart, William G., Numhead, county of Surrey, assignor of one-half to A. H. Bellingham, Peckham, England. Car-coupling	400,508	Apr. 2	116	31	47	27
Stubbers, Joseph, Cincinnati, Ohio. Oven for vapor or gas stoves	401,721	Apr. 16	1974	516	47	393
Stubblebine Patent Company. (See Stubblebine, William, assignor.)						
Stubblebine, William, Bethlehem, assignor to Stubblebine Patent Company, Philadelphia, Pa. Metallurgical furnace	404,369	May 28	2768	718	47	1216
Stubbs, Charles E., Fairfield, Iowa. Necktie-fastener	405,925	June 25	2337	614	47	1702
Stuck, Levi, Hart, Mich. Regulating-valve for dental vulcanizers	401,391	Apr. 16	1458	385	47	298
Studstill, John L. (See Welch, Michael L., assignor.)						
Stuebner, Gustavus L., Long Island City, N. Y. Coal-conveyer	402,284	Apr. 30	2825	730, 731	47	574
Sturges, F. C., trustee. (See Dimmick and Smith, assignors.)						
Sturm, Christian, Buffalo, N. Y. Hopper-valve	401,081	Apr. 9	976	261	47	195
Sturtevant, Thomas L., Framingham, Mass. Steam-generator	403,971	May 28	2131	558	47	1094
Sturtevant, Thomas L., Framingham, Mass. Apparatus for automatically regulating temperature of steam-generating tubes	403,972	May 28	2133	558	47	1095
Sturtevant, Thomas L., Framingham, and M. G. Davis, Somerville, Mass. Attrition-mill	403,970	May 28	2130	557	47	1094
Stut, John C. H., San Francisco, Cal. Valve-gear for compound engines	404,509	June 4	216	51, 52	47	1264
Stutzman, Frank. (See Arndt and Stutzman.)						
Suckow, Edmund, Buffalo, N. Y. Surface-current or tide motor	405,722	June 25	2041	536	47	1647
Sullivan, Cornelius P. (See Lowe and Sullivan.)						
Sullivan, Hugh J., Milwaukee, Wis. Pipe-supporting device	403,564	May 21	1543	406	47	971
Sullivan, John N., *et al.* (See Bryant, John C., assignor.)						
Sullivan, Philip B., Tuscarora, Nev. Safety device for elevators	402,780	May 7	342	88	47	727
Sully, Osborne E., Spencer, Iowa. Ribbon-holder	403,155	May 14	896	236	47	840
Summers, Benjamin, Petersburg, assignor of one-half to C. C. North, Huntingdon, Pa. Stamp-canceler	404,574	June 4	313	75	47	1284
Sumner, Alanson A. (See Bingham, Solon, assignor.)						
Sundeen, Alfred, and S. B. Molander, Mora, Minn. Soldering-iron	400,569	Apr. 2	117	32	47	27
Superior Drill Company. (See Patrie, Charles E., assignor.)						
Superior Drill Company. (See Patrie and Packham, assignors.)						
Superior Drill Company. (See Patrie and Rodgers, assignors.)						
Suppes, Max. M., Johnstown, Pa., assignor to Johnson Company, of Kentucky. Slot-rail for cable roads	405,231	June 11	1259	334	47	1480
Sutcliffe, Ely and G. E., Halifax, county of York, England. Sliver-coiling can for carding-engines	403,304	May 14	1142	303	47	887
Sutcliffe, Ely and G. E., Halifax, county of York, England. Apparatus for washing, bleaching, and dyeing	403,305	May 14	1143	303, 304	47	887
Sutcliffe, George E. (See Sutcliffe, Ely and G. E.)						
Sutcliffe, Hamlet, Oakland, Cal. Fire-grate	406,009	June 25	2480	648	47	1726
Sutcliffe, William W., New Orleans, La. Steam-boiler	401,683	Apr. 16	1797	471	47	360
Sutherland, Caroline V., Lathrop, Cal. Ointment	400,967	Apr. 9	814	.....	47	166
Sutherland, James, Philadelphia, Pa. Calico-printing machine	403,001	May 7	646	171	47	786
Sutterley, Gilbert T., Philadelphia, Pa. Brace	401,604	Apr. 16	1799	471	47	361
Sutton, Benjamin F., Brooklyn, N. Y. Tube-rest for syringes	402,925	Apr. 30	2826	731	47	574
Sutton, Simon T., Chicago, Ill. Full tights	402,202	Apr. 30	2709	703	47	552
Swain, Charles F., Methuen, Mass. Circular-knitting machine	400,510	Apr. 2	118	32	47	27
Swan, Henry C., Oshkosh, Wis. Vehicle-spring	403,022	May 21	1620	429	47	986
Swann, Fredrick. (See Lawton, Swann, and Whitehead.)						
Swann, John, *et al.* (See Ethridge, Martin V. B., assignor.)						
Swann, Richard T. (See Swann, Warner M. and R. T.)						
Swann, Warner M. and R. T., Dallas, Tex. Cotton-gin brush	403,973	May 28	2135	558	47	1095
Swanson, Martin, Crookston, Minn. Grading and ditching machine	402,781	May 7	343	88, 89	47	727
Swart, Lester D. (See Stevens, Brinkerhoff, and Swart.)						
Swartzwelder, Harrison, *et al.* (See Allfree, James B., assignor.)						
Sweet, Donald C., *et al.* (See Altenburg, Augustus, assignor.)						
Sweet, George, Dansville, N. Y. Harrow	402,029	May 7	113	27, 28	47	685
Sweet, Stephen R., assignor of two-thirds to W. Ackerman, Lima, Ohio. Bow-facing oar	402,114	Apr. 23	2573	667	47	516
Sweet, William A. (See Cartwright, Robert, assignor.)						
Swem, James M., Denver, Colo. Mechanism for operating switch-points	404,446	June 4	102	25	47	1245
Swenson, Alfred, Greenview, assignor to P. J. Palmquist, Menard, Ill. Car-coupling	404,575	June 4	314	75	47	1284
Swetitsch, Josef, assignor of one-half to J. H. Raap, Chicago, Ill. Refrigerator	403,789	May 21	1868	491	47	1036
Swett, Charles F., assignor of two-thirds to C. E. Morse and C. E. Kershaw, Jr., Auburn, Me. Saddle for velocipedes	403,078	May 7	776	205	47	808
Swett, Sullivan C. (See Webb and Swett.)						
Swift, Orrin W., New Haven, Conn. Die for shaping sheet metal	405,618	June 18	1852	490	47	1607
Swift, Robert. (See Brewster and Swift.)						
Swindell, William, Allegheny, Pa. Open-hearth melting-furnace	402,762	May 7	345	89, 90	47	727
Swope, Horace G. (See McSherry and Swope.)						
Symonds, Herbert, assignor to Mosler & Bro., St. Louis, Mo. Window-cap	405,232	June 11	1260	334	47	1480
Sypher, Abraham J., Iron Mountain, Mo. Rock-drill	403,496	May 14	1441	377, 378	47	942
Sypher, Abraham J., Iron Mountain, Mo. Steam rock-drill	405,127	June 11	1094	291	47	1449
Tack, Jean. (See Messerer, Stephan, assignor.)						
Taft, George C. (See Goulding, Alfred, assignor.)						
Taft, Stephen C., assignor of one-half to J. E. Clark, Franklin, Mass. Wool-washing machine	405,619	June 18	1853	491	47	1608

Terstegge, Gohmann & Co. (See Gohmann, Romanus C., assignor.)						
Tesla Electric Company. (See Tesla, Nikola, assignor.)						
Tesla, Nikola, New York, N. Y. Operating electro-magnetic motors	401,520	Apr. 16	1646	435	47	333
Tesla, Nikola, assignor to Tesla Electric Company, New York, N. Y. Electro-magnetic motor	405,858	June 25	2228	586	47	1684
Tesla, Nikola, assignor to Tesla Electric Company, New York, N. Y. Electrical power transmission	405,859	June 25	2229	586	47	1685
Tetley, Thomas W., Sheffield, county of York, England. Music-leaf turner	403,792	May 21	1873	492 / 493	47	1037
Tewksbury, Joseph R., Fort Madison, Iowa. Vignetting attachment for photographic printing frames	401,083	Apr. 9	980	261 / 262	47	195
Thake, John, *et al.* (See Whitlock, Ephraim J., assignor.)						
Thatcher, Walter R., Oskaloosa, Iowa. Hay-cap	404,577	June 4	322	77	47	1286
Thayer, Albert F., Maple Hill, Kans. Car-dumping apparatus	404,447	June 4	105	26	47	1246
Thayer, Harry B., New York, N. Y., assignor to Western Electric Company, Chicago, Ill. Spring-jack switch	400,909	Apr. 9	817	218	47	166
Thayer, Isaac. (See Locke and Thayer.)						
Thayer, William H., Melrose, Mass. Reservoir for holding liquids under pressure	401,880	Apr. 23	2357	613	47	476
Thayer, William S., Owego, N. Y. Harness-girth	403,604	May 7	649	172	47	786
Theobald, John W. (See Aschenbach and Theobald.)						
Thistle, Edward. (See Budd and Carroll, assignors.)						
Thode, Gustav A., Holstein, Iowa. Check-row corn-planter	405,444	June 18	1581	418	47	1552
Thoma, Henry J., *et al.* (See Woll, Joseph E., assignor.)						
Thomas, Benjamin F., Denver, Colo. Magnetic pocket-book	402,491	Apr. 30	3154	816	47	636
Thomas, C. K., *et al.* (See Black, William J., assignor.)						
Thomas, Charles D., *et al.* (See Tyrrell, William M., assignor.)						
Thomas, Charles H., Hancock, Wis. Pipe-gripping attachment for wrenches	401,605	Apr. 16	1601	472	47	361
Thomas, Chauncey, Boston, Mass. Carriage	405,723	June 25	2043	536 / 537	47	1647
Thomas, Earl G., *et al.* (See Tyrrell, William M., assignor.)						
Thomas, Frederick A., Chicago, Ill. Cover for fruit-baskets	403,156	May 14	897	237	47	840
Thomas, George, assignor of one-third to J. H. Simpson, New York, N. Y. Mechanical telephone	401,227	Apr. 9	1201	321	47	237
Thomas, George H., Chicopee Falls, Mass. Button	401,084	Apr. 9	981	262	47	195
Thomas, Henry O., Cheyenne County, Nebr., assignor to W. Holt, Denver, Colo. Vegetable-parer	403,793	May 21	1874	493	47	1037
Thomas, J. R. (See Elkins, William F., assignor.)						
Thomas, John C., Jamestown, N. Y. Washing-machine	404,061	May 28	2282	597 / 598	47	1124
Thomas, Joseph, and G. Creter, New York, N. Y. Shuttle-carrier for quilting-machines	401,981	Apr. 23	2359	614	47	477
Thomas, Joseph H., Alliance, Ohio. Flour bin and sifter	403,974	May 28	2136	559	47	1095
Thomas, Joseph W., Sargent, Nebr. Side curtain for buggies	400,660	Apr. 2	258	70	47	54
Thomas, Levi H., Chicago, Ill. Lamp	403,400	May 14	1393	341	47	917
Thomas, Thomas C. J., Finsbury Park, county of Middlesex, England. Gas-lamp	402,204	Apr. 30	2713	704	47	553
Thomas, William. (See Xander and Thomas.)						
Thomas, William H., Jenkintown, Pa. Attachment for bolts	402,492	Apr. 30	3155	817	47	636
Thomas, William H., Jenkintown, Pa. Latch for sliding doors	402,493	Apr. 30	3156	817	47	636
Thomas, William J., Sancelito, Cal. Balanced piston for steam-engines	405,132	June 11	1100	293	47	1450
Thomas, William R., Catasauqua, Pa. Magnetic ore-separator	403,624	May 21	1022	429	47	987
Thompson, Addison, Clear Lake, Iowa. Combined whip-socket and rein-holder	405,133	June 11	1100	293	47	1450
Thompson, Albert F., Adel, Iowa. Watch-maker's tool	404,837	June 11	928	244	47	1305
Thompson, Caleb M., Greenville, Pa. Sand-reel	402,631	May 7	115	28	47	686
Thompson, Colin M., Brooklyn, N. Y. Rope or cable	400,970	Apr. 9	818	219	47	166
Thompson, David W., Englewood, Ill. Commutating device	401,801	Apr. 23	2102	549	47	427
Thompson, Edward P., Elizabeth, N. J. Manufacture of carbon filaments	401,606	Apr. 16	1602	472	47	362
Thompson, Edward P., Elizabeth, N. J. Manufacture of incandescing carbon filaments	401,607	Apr. 16	1604	472	47	362
Thompson, Edward P., Elizabeth, N. J. System of electrical distribution	403,308	May 14	1148	305	47	888
Thompson, Frank H., and G. P. Torney, Philadelphia, Pa. Device for securing tools to handles	404,663	June 4	435	109	47	1309
Thompson, George D., Lockland, Ohio. Attachment for photographic cameras	401,802	Apr. 23	2105	549	47	427
Thompson, George L., Chicago, Ill. Curling-iron	404,127	May 28	2386	625	47	1145
Thompson, George L., Chicago, Ill. Curling-iron	404,128	May 28	2387	626	47	1146
Thompson, George L., Chicago, Ill. Combined comb and curling-iron	404,129	May 28	2388	626	47	1146
Thompson, Henry L. (See Knapp and Thompson.)						
Thompson, John, Philadelphia, Pa. Cigar-machine	405,724	June 25	2044	537	47	1648
Thompson, John B., assignor of one-half to E. O. Ely, Boston, Mass. Nasal irrigator	403,794	May 21	1876	494	47	1038
Thompson, Robert J., Grandin, Mo. Dog attachment for log-cars	403,898	May 21	2025	532 / 533	47	1066
Thompson, Robert P. (See Thompson, William P. and R. P.)						
Thompson, Samuel, Chicago, Ill. Horseshoe and pad	400,514	Apr. 2	124	33	47	28
Thompson, Samuel, Englewood, Ill. Scraper	403,625	May 21	1022	430	47	987
Thompson, Samuel C., New York, N. Y. Surveyor's target	405,058	June 11	1005	268	47	1432
Thompson, Thomas J., Brooklyn, assignor to Matthews Decorative Glass Company, New York, N. Y. Chipping or crystallizing glass	405,283	June 18	1346	355	47	1504
Thompson, Walter, *et al.* (See Brewer, William J., assignor.)						
Thompson, William P. and R. P., Philadelphia, Pa. Valve for reducing and regulating pressure of fluids	401,962	Apr. 23	2361	614	47	477
Thomson & Co., Judson L. (See Unbehend, Jacob J., assignor.)						
Thomson Electric Welding Company. (See Lemp, Hermann, assignor.)						
Thomson Electric Welding Company. (See Thomson, Elihu, assignor.)						
Thomson, Elihu, Lynn, Mass. Apparatus for regulating current or potential in secondary of transformers	400,515	Apr. 2	125	33, 34	47	28
Thomson, Elihu, Lynn, Mass. Regulating current or potential in secondary of transformers	400,516	Apr. 2	129	34	47	29
Thomson, Elihu, Lynn, Mass. Alternating-current electric motor	400,971	Apr. 9	819	219	47	166
Thomson, Elihu, Lynn, Mass. Induction-coil and self-inductive apparatus	400,972	Apr. 9	821	219	47	167

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Thomson, Elihu, Lynn, assignor to Thomson Electric Welding Company, Boston, Mass. Electric soldering, brazing, and welding	403,707	May 21	1744	429	47	1012
Thomson, John. (See Mead and Thomson.)						
Thomson, John, Kansas City, Mo. Suspended railway	405,059	June 11	1906	283	47	1432
Thomson, William, Glasgow, county of Lanark, Scotland. Azimuth-instrument	402,361	Apr. 30	2950	704	47	597
Thomson, William H., New York, N. Y. Base for fence-posts	405,445	June 18	1584	418	47	1553
Thone, Frank, Oskaloosa, Iowa. Dynamo-electric machine	405,224	June 18	1347	359	47	1504
Thorn, Theodore, St. Clair, Pa. Brick	400,974	Apr. 9	826	229	47	167
Thorne Machine Company. (See Freeman, Henry, assignor.)						
Thorne Machine Company. (See Nelson, Robert W., assignor.)						
Thornton, William W. (See Holand, George W., assignor.)						
Thorpe, Walter F. (See Messer and Thorpe.)						
Thorpe, Wesley C., Jr. (See Glenn, George W., assignor.)						
Thum, Hugo, Grand Rapids, Mich. Moistening press-copying leaves	402,205	Apr. 30	2716	705	47	553
Thum, Otto and W., Grand Rapids, Mich. Combined sticky fly-paper holder and trap. (Reissue)	11,000	Apr. 30	3242	841	47	653
Thum, William. (See Thum, Otto and W.) (Reissue.)						
Thurman, Robert W. (See Griswold, Thurman, and Wright.)						
Thurman, Robert W., assignor to Lone Jack Cigarette Company, Lynchburg, Va. Machine for making mouth-pieces or holders for cigars, cigarettes, &c	400,806	Apr. 2	566	135 156	47	108
Thurston, George P., San Francisco, Cal. Windmill	401,867	Apr. 23	2186	573	47	443
Tibbits, John B. (See Bottome, Turner D., assignor.)						
Tibbs, Charles, Vandalia, Ill. Gate	403,401	May 14	1305	341	47	917
Tice, Edwin A., London, county of Middlesex, England. Dental mirror	404,021	May 28	2201	578	47	1108
Ticehurst, Francis W. (See Edge and Ticehurst.)						
Tidball, Wellar A., Independence, and W. B. Von Stein, Fort Dodge, Iowa. Twine-holder	402,206	Apr. 30	2717	705	47	554
Tiemann, Fredrich W., Fort Wayne, Ind. Washing-machine	401,228	Apr. 9	1202	321	47	237
Tierney, Michael V., *et al.* (See Sterick, Sylvester T. F., assignor.)						
Tiers, Cornelius. (See Pendleton, Bryson, Tiers, and Moss.)						
Tiers, Cornelius. (See Pendleton, Tiers, Bryson, and Moss.)						
Tiers, Cornelius, New York, J. H. Pendleton, Brooklyn, and A. Bryson, Jr., assignors to Rapid Transit Cable Company, New York, N. Y. Grip for cable railways	404,576	June 4	315	75 76 77	47	1285
Tigner, James A., Gordon, La. Manure-distributer	401,768	Apr. 23	2043	534	47	417
Tillmann, Emanuel M. (See Goldberg and Tillmann.)						
Tillson, Isaiah N., Whitman, Mass. Mechanism for extinguishing the lights in railway-cars	404,749	June 4	545	140	47	1332
Timmons, Samuel H., Evansville, Ind. System of applying power to steam-vessels	404,578	June 11	745	190	47	1378
Tinker, George L., New Philadelphia, and W. S. Kline, Bolivar, Ohio. Bee-hive	400,517	Apr. 2	134	34, 35	47	29
Tinoco, José M. (See Carranza and Tinoco.)						
Tipton, Benjamin F. (See Monday and Tipton.)						
Titus, George B., Irondequoit, N. Y. Poisonous-powder duster	401,313	Apr. 9	1330	354	47	292
Tivy, William H., and L. Ehrlich, assignors to American Roll Paper Company, St. Louis, Mo. Paper-cutter	401,321	May 28	2094	599	47	1292
Tobey, Frederick W. (See Atwood and Tobey.)						
Toense, Carl G., Pittsburg, Pa. Windlass	405,446	June 18	1586	419	47	1553
Toepfer, Peter G., Milwaukee, Wis. Apparatus for malting grain	400,807	Apr. 2	568	136	47	109
Tomlinson, Edwin R., assignor of one-half to Eaton, Cole & Burnham Company, Bridgeport, Conn. Steam-whistle	405,622	June 18	1858	491 492	47	1608
Tompkins, Alfred S., Holmwood, Caterham, county of Surrey, England. Portable cooking-stove and utensils	404,578	June 4	321	77	47	1286
Tompkins, John D., Brainard, assignor to Tompkins Paper Stock Company, Albany, N. Y. Apparatus for treating vegetable substances	401,609	Apr. 16	1807	473	47	302
Tompkins, John D., Brainard, assignor to Tompkins Paper Stock Company, Albany, N. Y. Apparatus for treating vegetable substances	401,610	Apr. 16	1808	473	47	303
Tompkins Paper Stock Company. (See Tompkins, John D., assignor.)						
Tompkins, Samuel D., *et al.* (See Matlock, John N., assignor.)						
Tompkins, Samuel D., and T. H. Williams, Jersey City, N. J. Radiator	402,547	Apr. 30	3233	838	47	651
Tonkin, John J., assignor to T. Kingsford, Oswego, N. Y. Cut-off valve	401,983	Apr. 23	2362	614 615	47	477
Toohey, Matthew D., Galveston, Tex. Push-bar for locomotives	400,518	Apr. 2	136	35	47	29
Toomey, Samuel, Canal Dover, Ohio. Thill for sulkies	403,079	May 7	776	205	47	868
Töpfer, John, Brooklyn, N. Y. Straw-cutter	403,130	May 28	2290	624	47	1146
Toquet, Benjamin L., Westport, Conn. Hair-curling implement	404,664	June 4	436	109	47	1310
Toraya, José F., Havana, Cuba, assignor to Toraya Patent Gas Company, Philadelphia, Pa. Apparatus for the manufacture of gas	404,730	June 4	547	140	47	1333
Toraya Patent Gas Company. (See Toraya, José F., assignor.)						
Torney, George P. (See Thompson and Torney.)						
Totten, R. C. (See Melaney, William H., assignor.)						
Totten, Robert C. (See Melaney, William H., assignor.)						
Tower, George W., Boston, Mass. Machine for cutting screw-tape	400,882	Apr. 2	677	124 125	47	130
Tower & Lamont. (See Lamont, John, assignor.)						
Towle, Charles B., San Francisco, Cal. School-desk	403,795	May 21	1877	494	47	1038
Towle, Charles B., San Francisco, Cal. School-desk	403,796	May 21	1879	494	47	1038
Towne, Charles H., Chippewa Falls, Wis. Rack for newspaper-files	403,797	May 21	1880	494	47	1039
Townsend, Herman F., Plainfield, Vt., and C. T. Winslow, Woodsville, N. H. Flooring-jack	401,868	Apr. 23	2188	572	47	444
Tracy, Erwin J., Sioux Falls, Dak. Ter. Rack for hay-wagons	405,190	June 11	1260	310	47	1469
Tracy, Milton S., Glastonbury, Conn. Frying-pan	404,131	May 28	2391	626	47	1146
Tracy, William A. (See Greenleaf, Charles H., assignor.)						
Tracy, William P., Grand Rapids, Mich. Slide for dressing-cases	405,623	June 18	1859	492	47	1609
Tranell, Johan A., Chicago, Ill., assignor to McGuire Manufacturing Company, of Illinois. Forming rail-braces	403,450	May 14	1370	350	47	929
Trapp, Edward A., Brooklyn, N. Y. Optical device for the observation of localities by reflection	401,229	Apr. 9	1203	321	47	237
Trapp, Edward A., Brooklyn, N. Y. Drip-pan for elevated railways	404,751	June 4	549	140	47	1333
Traak, Ambrose. (See Donnelly, McLaren, and Traak.)						
Trant, Justus A., assignor to Stanley Rule and Level Company, New Britain, Conn. Sighting attachment for levels	402,869	May 7	471	123	47	751
Trant, Justus A., assignor to Stanley Rule and Level Company, New Britain, Conn. Sighting attachment for spirit-levels	405,624	June 18	1860	492	47	1609

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Trautmann, Wilhelm, Berlin, Germany. Dust-collector	403,798	May 21	1881	495	47	1039
Traver, Adelbert L., assignor of one-half to J. Aken, Piltmont, N. Y. Button-hole cutter for sewing-machines	400,975	Apr. 9	826	220 221	47	167
Traves, Charles E. (See Traves, Webester F. and C. E.)						
Traves, Webester F. and C. E., Los Angeles, Cal. Offer	402,632	May 7	116	28	47	686
Travis, William D. T., Burlington, N. J. Fire-extinguisher for ships	404,132	May 28	2392	627	47	1146
Travis, William H., Philadelphia, Pa., assignor to J. Densmore, Brooklyn, N. Y. Desk or cabinet	401,314	Apr. 9	1331	354	47	292
Treacy, Frank H., Poughkeepsie, N. Y., assignor to Palmer Torpedo Railway Signal Company, Plainfield, N. J. Interlocking signal apparatus for railway-switches	401,666	Apr. 16	1890	492	47	377
Treanor, James J., Hastings-upon-Hudson, N. Y. Railway-car	403,309	May 14	1150	306	47	889
Treat, Francis H., assignor of two-thirds to H. S. Smith and C. Pettigrew, Joliet, Ill. Rolling-mill	402,781	May 7	347	90 91 92	47	728
Treat, Francis H., assignor of two-thirds to H. S. Smith and C. Pettigrew, Joliet, Ill. Dust-catcher for blast-furnaces	404,807	June 4	633	162 163	47	1350
Treharn, Joseph L., assignor of two-thirds to J. S. Blacker and G. Gerstle, Cincinnati, Ohio. Shoe-sewing machine	404,448	June 4	106	26	47	1246
Treman, James C. (See Greene and Treman.)						
Tremblay, Eucher. (See Gale and Tremblay.)						
Trenner, Alfred B., Cincinnati, Ohio. Preparing fly-paper	402,870	May 7	472	123	47	751
Trethewey, Samuel, Pittsburg, Pa. Valve-gear for steam-hammers	400,519	Apr. 2	137	35	47	30
Trevitt, Constant S., and S. F. Monck, Lincoln, Nebr. Barbed fence	404,879	June 11	746	190	47	1378
Treweek, Joseph, Lead City, Dak. Ter. Tool-car for mines	404,510	June 4	219	52	47	1305
Tribe, Thomas, Colorado Springs, Colo. Hanging sliding curtains	405,331	June 18	1417	373	47	1519
Tripp, Charles H., Boston, Mass. Machine for spinning hemp, &c	402,785	May 7	351	92	47	729
Tripp, Herman, and L. Lattan, Chicago, Ill. Hasp-lock	402,987	Apr. 30	2718	705	47	554
Trost, Henry C., Chicago, Ill., and F. A. Weston, Dodge City, Kans. Sash-fastener	402,074	Apr. 23	2507	655	47	504
Trott, Charles F. (See Whiting, William S., assignor.)						
Trout, Hiram B., Terre Haute, Ind. Attachment for mining-machines	403,607	May 7	655	173	47	787
Truesdale, Charles, Cincinnati, Ohio. Molder's ladle or crucible	402,871	May 7	473	124	47	751
Truesdell, Lucius E., Bristol, N. H. Camp-chair	405,725	June 25	2047	538	47	1648
Tryon, Clarence E. (See Tryon, Le Roy C., assignor.)						
Tryon, Le Roy C., Marseilles, assignor of one-half to C. E. Tryon, Ottawa, Ill. Grain-weighing machine	402,872	May 7	474	124	47	751
Tschumy, Robert, Chattanooga, Tenn. Handle attachment for shovels, &c	404,310	May 14	1151	306	47	889
Tubbs, Henry C., assignor of one-half to J. W. Brown, Bangor, Mich. Hand-cultivator	404,995	June 11	912	241	47	1412
Tuch, Morris, Elmira, N. Y. Combination garment-pattern	402,046	Apr. 23	2466	643	47	496
Tucker, Charles. (See Tucker, Henry, C., and J.)						
Tucker, Edwin W., San Francisco, Cal. Surface-condenser	403,799	May 21	1882	495	47	1039
Tucker, Elias W., and A. P. Orr, Arcadia, Ind. Clothes-pounder	401,234	May 28	2360	607	47	1477
Tucker, Henry, C., and J. Tucker, deceased, (said H. and C. Tucker administrators,) Newark, N. J. Turning-machine	405,749	June 25	2083	546 547	47	1655
Tucker, Joseph. (See Tucker, Henry, C., and J.)						
Tucker, Stephen D., *et al.* (See Crowell, Luther C., assignor.)						
Tucker, Stephen D., New York, N. Y. Stop mechanism for cylinder printing-machines	401,473	Apr. 16	1580	418	47	321
Tuerk, Frederick W., Jr., assignor of two-thirds to J. C. Hunter, Syracuse, and J. Hunter, Sterling Valley, N. Y. Water-motor	400,976	Apr. 9	828	221	47	167
Tuerk, Frederick W., Jr., assignor of two-thirds to J. C. Hunter, Syracuse, and J. Hunter, Sterling Valley, N. Y. Water-motor	400,310	Apr. 2	259	71, 72	47	54
Tully, James W., San Francisco, Cal. Adjustable attachment and extension for fire-ladders	400,883	Apr. 2	679	185	47	130
Turman, William F., Weatherford, Tex. Rein-holder	404,511	June 4	220	52	47	1305
Turnbull, Henry C., Jr., trustee. (See Graf, Robert R., assignor.)	404,579	June 4	324	78	47	1286
Turner, Charles E. (See Turner, Joseph A., assignor.)						
Turner, Isaac J., Princeton, N. J. Chimney-cowl	402,365	Apr. 30	2951	765	47	597
Turner, James A., Evanston, Ill. Hinge	401,086	Apr. 9	984	262	47	196
Turner, Joseph A., assignor to C. E. Turner, St. Louis, Mo. Switch device for electric currents	400,808	Apr. 2	569	157	47	109
Turner, Robert R., Columbus, Ohio. Apparatus for producing gas	404,222	May 28	2694	700	47	1302
Turner, William E., and J. F. Hudson, Benkelman, Nebr. Axle-lubricator	403,008	May 7	656	173	47	787
Turton, Benjamin, assignor of three-fourths to J. L. Doremus, J. and H. Turton, Newark, N. J. Spring-motor	402,548	Apr. 30	3233	838 839	47	651
Turton, Harry, *et al.* (See Turton, Benjamin, assignor.)						
Turton, John, *et al.* (See Turton, Benjamin, assignor.)						
Tuttle, Clarence R., Chicago, Ill. Arm-support for telephones	400,590	Apr. 2	140	36	47	30
Tweedale, Edmund, assignor to J. Bullough, Accrington, county of Lancaster, England. Device for adjusting card-flats	405,625	June 18	1861	492 493	47	1609
Tweedale, Samuel, Accrington, county of Lancaster, England. Machine for opening and scutching cotton	404,133	May 28	2393	627	47	1146
Tweedy, George. (See Davis and Tweedy.)						
Twichell, Jerome, Kansas City, Mo. Furring-strip for walls or ceilings	400,521	Apr. 2	141	37	47	30
Tyler, Aaron J., Albion, N. Y. Hydrant	402,115	Apr. 23	2573	668	47	517
Tyler, Aaron J., Albion, N. Y. Pump-brake	402,116	Apr. 23	2578	668	47	518
Tyler, Joseph J., London, England. Rotary water-meter	402,786	May 7	352	92	47	729
Tynan, Joseph E., Paterson, N. J. Spindle for spinning and support therefor	402,699	May 7	216	57	47	704
Tyrrell, Charles D., *et al.* (See Tyrrell, William M., assignor.)	404,134	May 28	2396	628	47	1147
Tyrrell, Gordon M., New Haven, Conn. Buckle	404,323	May 28	2690	700	47	1303
Tyrrell, William M., assignor to E. G. and C. D. Thomas, Gloversville, N. Y. Glove or mitten	402,287	Apr. 30	2928	732	47	575
Tyson, Thomas, Mound City, Mo. Gate	400,611	Apr. 2	262	72	47	55
Tyson, Thomas, Mound City, Mo. Gate	401,315	Apr. 9	1332	334 335	47	293
Udelewitz, Carpel. (See Botkin, Abram, assignor.)						
Udstad, Sivert, Aurora, Ill. Rod-packing	401,984	Apr. 23	2364	615	47	477
Uhlinger, William P., Philadelphia, Pa. Double-lift open-shed dobby	403,565	May 21	1543	406 407	47	971
Ullman, Sabbati E., New York, N. Y. Serum-albumen peptone	402,494	Apr. 30	3157	.....	47	636
Ulrich, John. (See Wiesendanger and Ulrich.)						
Umstead, Daniel W., Earlington, Ky. Guide for piston-rods	405,511	June 18	1697	448	47	1577
Unbehend, Jacob J., assignor to J. L. Thomson & Co., Syracuse, N. Y. Riveting-machine	405,929	June 25	2343	615	47	1703
Underwood, Charles M., Hamilton, Ontario, Canada. Inscription and motto plate	405,830	June 25	2157	567	47	1670
Underwood, Walter H., Yonkers, N. Y. Reservoir-brush	403,566	May 21	1545	407	47	972

Vail, Joseph, Garden Grove, Iowa. Felt boot	404,449	June 4	113	27	47	1247
Vail, Jonathan H., New York, N. Y. Feed-water heater	404,512	June 4	221	53	47	1265
Valentine & Company. (See Rose, Frank H., assignor.)						
Valentine & Grigg Motor Company. (See Valentine and Grigg, assignors.)						
Valentine, Joseph R., and A. T. Grigg, assignors to Valentine & Grigg Motor Company, Pueblo, Colo. Railway-motor	400,522	Apr. 2	142	37	47	30
Vallens, Eugene. (See Moos, Joseph B., assignor.)						
Valon, William A. M., Ramsgate, assignor of one-half to Continental Oxygen Company, (limited,) Westminster, England. Purifying gas	402,787	May 7	353	.....	47	729
Van Arsdale, Henry, Racine, Wis. Bolster-spring	405,192	June 11	1202	310	47	1470
Van Demark, William, Phelps, N. Y. Fountain-pen	401,985	Apr. 23	2365	615	47	478
Van Depoele, Charles J., Lynn, Mass. Alternating-current electric reciprocating engine	400,809	Apr. 2	571	137	47	109
Van Depoele, Charles J., Lynn, Mass. Reciprocating electric-engine system	401,231	Apr. 9	1208	342, 343	47	238
Van Depoele, Charles J., Lynn, Mass. Universal upward-pressure contact-arm	402,117	Apr. 23	2579	669	47	518
Van Depoele, Charles J., Lynn, Mass. Electric railway	403,201	May 21	1887	496	47	1040
Van Depoele, Charles J., Lynn, Mass. Electro-dynamic motor	404,394	May 28	2696	700, 701	47	1203
Van Depoele, Charles J., Lynn, Mass. Closed slotted conduit	404,325	May 28	2700	701	47	1203
Van Depoele, Charles J., Lynn, Mass. Switch for suspended electric conductors	405,627	June 18	1866	494	47	1610
Van Depoele, Charles J., Lynn, Mass. Closed slotted conduit for electric railways	405,628	June 18	1869	494, 495	47	1610
Van Depoele, Charles J., Lynn, Mass. Standing contact-arm	405,750	June 25	2085	547	47	1656
Van Depoele, Charles J., Chicago, Ill. Regulator for dynamo-electric machines	401,230	Apr. 9	1205	342	47	237
Van Depoele, Charles J., Chicago, Ill. Slotted conduit for electric conductors	403,609	May 7	656	173, 174	47	787
Van Depoele, Charles J., Chicago, Ill. Electric connection for railway-rails	403,610	May 7	660	174	47	788
Van Depoele, Charles J., Chicago, Ill. Electric locomotive	403,611	May 7	661	174, 175	47	788
Van Depoele, Charles J., Chicago, Ill. Slotted conduit for electric conductors	403,800	May 21	1885	496	47	1040
Van Depoele, Charles J., Chicago, Ill. Slotted conduit for electrical conductors	405,626	June 18	1862	493, 494	47	1609
Van Derveer & Holmes Biscuit Company. (See Fitz Gerald, Augustine F., assignor.)						
Van Derveer, Milton T., Amsterdam, N. Y. Amalgamator	405,447	June 18	1589	419	47	1554
Van Dorn, William L., Brooklyn, N. Y. Electric belt	402,367	Apr. 30	2953	766	47	598
Van Dorston, Alvin W., Washington, D. C., assignor to Van Dorston Cushioned Car Coupling Equipment Company, Portland, Me. Car-coupling	405,384	June 18	1485	394	47	1533
Van Dorston Cushioned Car Coupling Equipment Company. (See Van Dorston, Alvin W., assignor.)						
Van Dyke, Thomas E. (See Cox and Van Dyke.)						
Van Epps, Frank L., Hudson, Mich. Telegraph-sounder	403,626	May 21	1624	430	47	987
Van Gestel, Jean T., New York, N. Y. Secondary battery	405,751	June 25	2087	547	47	1656
Van Hagen, Isaac, assignor, by mesne assignments, to J. H. Raymond, trustee, Chicago, Ill. Lantern-frame	405,629	June 18	1875	496	47	1611
Van Horn, Nathaniel R., assignor to Union Manufacturing Company, Toledo, Ohio. Cover for sewing-machines	404,752	June 4	550	141	47	1333
Van Huffel, Peter. (See Niles and Van Huffel.)						
Van Nest, George, assignor of one-half to G. V. Clickener, Raritan, N. J. Nut-lock	404,370	May 28	2770	718	47	1217
Van Rysselberghe, François, Brussels, Belgium, assignor to himself, and Phono-Multiplex Telegraph Company, Baltimore County, Md. Harmonic telegraphy	400,523	Apr. 2	143	38	47	31
Van Woert, George S., Catskill, N. Y. Sample-envelope	400,524	Apr. 2	146	38	47	31
Van Zile, Edward S., assignor to E. A. Grozier and F. A. Duneka, New York, N. Y. Bulletin-board and base-ball indicator	402,700	May 7	217	57	47	704
Vancor, George W. (See Cook, Albert E., assignor.)						
Vanderbilt, William H. (See Cary, Spencer C., assignor.)						
Vanderburg, W. S. (See Batter, Frank, assignor.)						
Vangilder, J. F., *et al.* (See McClellan, James A., assignor.)						
Vanasteenkiste, Achille. (See Quénéhen and Vanasteenkiste.)						
Vardon, Maurice M., Toronto, Ontario, Canada. Case for displaying sheets of paper	405,630	June 18	1876	496	47	1611

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
Vare, Thomas W., Trenton, N. J. Anvil-mold	402,368	Apr. 30	2954	706	47	598
Varley, John J. (See Barrett and Varley.)						
Vauclain, Samuel M., Philadelphia, Pa. Compound locomotive-engine	406,011	June 25	2484	649	47	1727
Vauclain, Samuel M., Philadelphia, Pa. Valve for compound engines	406,012	June 25	2486	650	47	1727
Vaughn, James M., Water Valley, Ky. Hand-power saw	404,753	June 4	551	141	47	1334
Vaughn, John W., Jersey City, N. J. Automatic ticket-selling machine	404,450	June 4	114	27	47	1247
Vehon, Abraham, New York, N. Y. Ornamenting cloth	404,002	May 28	2683	.....	47	1124
Veil, Fredrick, Allegheny, Pa. Stove	400,612	Apr. 2	263	72	47	55
Venu, Isaac H., assignor of one-half to E. G. W. Bartlett, Yonkers, N. Y. Elevator	400,613	Apr. 2	264	73	47	55
Ventzki, August J., Graudenz, Prussia, Germany. Adjusting device for wheel-plows	400,977	Apr. 9	829	221, 222	47	168
Vermehren, Nicolai, Copenhagen, Denmark. Ruler	401,392	Apr. 16	1450	385	47	298
Vetter, Joseph C., New York, N. Y. Galvanic battery	403,802	May 21	1891	497	47	1041
Vezie, Charles, Denison, Tex. Foot for sand-levers	401,611	Apr. 16	1811	474	47	363
Victor Safe and Lock Company. (See Baum, Jacob, assignor.)						
Vinton, John H., Boston, Mass., assignor to Peninsular Novelty Company, Grand Rapids, Mich. Button-setting machine	401,393	Apr. 16	1450	385	47	298
Vinton, John H., Boston, Mass., assignor to Peninsular Novelty Company, Grand Rapids, Mich. Button-setting machine	402,047	Apr. 23	2467	643	47	496
Vinyard, Charles O., Navajo Springs, Ariz. Ter. Nut-lock	404,326	May 28	2703	702	47	1204
Vitalis, Baptiste, Pittsburg, Pa. Smoke-stack	402,873	May 7	476	124	47	751
Vogel, Gustav F. (See Wilson, Arthur H., assignor.)						
Vogel Petroleum Heating Company. (See Vogel, William, assignor.)						
Vogel, William, assignor to Vogel Petroleum Heating Company, Chicago, Ill. Burner for liquid fuel	406,013	June 25	2487	650, 651	47	1728
Vogelsang, Alexander, assignor to Vogelsang Screw Propeller Company, Brooklyn, N. Y. Screw-propeller. (Reissue)	10,997	Apr. 23	2596	672	47	532
Vogelsang Screw Propeller Company. (See Vogelsang, Alexander, assignor.) (Reissue.)						
Voges, Bernhard. (See Parker and Voges.)						
Vogt, Louis J. (See Klippert, Charles V., assignor.)						
Voigt, Ferdinand F., Chicago, Ill. Track-laying machine	404,996	June 11	913	241, 242	47	1412
Volk, Adam, assignor of one-half to U. Lerch, Lockport, N. Y. Rope-clamp	405,686	June 18	1982	519	47	1630
Von Blitzingslöwen, Bruno, and M. Howard, New York, N. Y.; said Von Blitzingslöwen assignor to said Howard. Brooch-pin	402,701	May 7	218	57	47	705
Von Oven, Ernest, Naperville, Ill. Brick-kiln	402,369	Apr. 30	2955	766	47	598
Von Stein, William B. (See Tidball and Von Stein.)						
Von Welsbach, Carl A., Vienna, Austria-Hungary, assignor to Welsbach Incandescent Gas Light Company, of New Jersey. Gas-incandescent	403,603	May 21	1892	.....	47	1041
Von Welsbach, Carl A., Vienna, Austria-Hungary, assignor to Welsbach Incandescent Gas Light Company, of New Jersey. Gas-incandescent	403,604	May 21	1893	.....	47	1041
Vose, Clifton, Brooklyn, N. Y. Screw-propeller for vessels	402,674	May 7	477	124, 125	47	752
Voss, Adolph, Gloucester, Mass. Windlass	401,316	Apr. 9	1333	335	47	263
Voss, John C., El Paso, Tex. Oven-thermometer	403,710	May 21	1749	400	47	1012
Vulcan Manufacturing Company. (See Pomeroy, Charles, assignor.)						
Waddell, Ralph P., Alameda, Cal. Sash-holder	405,512	June 18	1698	449	47	1577
Waddell, William H., Lexington, Va. Electrical railway-signaling	400,522	Apr. 2	146	38	47	31
Wade, Bryant E., Rockford, Ill. Thill-coupling	400,526	Apr. 2	148	39	47	32
Wade, Kirtland H., Chicago, Ill. Switch-signal	401,869	Apr. 23	2189	572	47	444
Wadleigh, Joseph, Milks Grove, Ill. Mechanism for operating baling-presses	405,286	June 18	1349	356	47	1505
Wadsworth, Herbert. (See Gammons, Rollins, and Wadsworth.)						
Wadsworth, Homer N., assignor of one-half to J. H. Dickson, Wellington, Ohio. Wood-rack	404,327	May 28	2704	702	47	1204
Waeber, Gustavus A., New York, N. Y. Metal can, box, or other receptacle	401,913	Apr. 23	2363	589	47	458
Waffenfabrik Mauser. (See Mauser, Paul, assignor.)						
Wagandt, Charles L., assignor of one-half to Keen & Hagerty, Baltimore, Md. Soldering-tool	402,634	May 7	120	29	47	687
Wagandt, Charles L., assignor to Keen & Hagerty, Baltimore, Md. Child's tray	402,788	May 7	354	93	47	729
Waggoner, Edward P., Syracuse, N. Y. Steam-heater	402,635	May 7	121	29	47	6-7
Waggoner, George H., Leslie, Mich. Bevel	404,451	June 4	116	27	47	1247
Wagner, S. F. (See Marshall and Rickerd, assignors.)						
Wait, John H., Junction City, Oreg. Automatic safety railway-switch	405,513	June 18	1699	449	47	1577
Waite, Henry E., *et al.* (See Ethridge, Martin V. B., assignor.)						
Waite, Henry E., New York, N. Y. Friction-generator	405,334	June 18	1418	373	47	1520
Wakefield, Charles H., Sherbrooke, Quebec, Canada. Foot-guard for frogs, switches, &c.	402,209	Apr. 30	2719	706	47	554
Wakefield Rattan Company. (See Leavis, Henry T., assignor.)						
Wakefield Rattan Company. (See Lemman, John, assignor.)						
Wakeman, Wilbur F., Kansas City, Mo. Temporary binder	404,513	June 4	222	53	47	1266
Walberg, Lars E., Hollister, Cal. Cart-spring	405,193	June 11	1204	320	47	1470
Walch, Paul O., Paris, France. Wire fastening for bottle-stoppers	402,370	Apr. 30	2957	767	47	598
Wilder, Paul, Buda-Pesth, Austria-Hungary. Leather-thong cutter	403,805	May 21	1894	497	47	1041
Waldron, Thomas, Sheldon, Mo. Washing-machine	401,709	Apr. 23	2044	534	47	417
Wales, Sigourney, Terre Haute, Ind., assignor to C. B. Fox, Boston, Mass. Pencil-holder	403,567	May 21	1546	407	47	972
Walker, David C. (See Lehman, Edwin W., assignor.)						
Walker, Enos L., St. Louis, Mo., assignor of one-half to G. Hoyt, Brooklyn, N. Y. Folding bottle-case	404,809	June 4	636	163, 164	47	1351
Walker, George W. (See Bartlett, John W., assignor.)						
Walker, Hugh W., and T. L. Patterson, Greenock, county of Renfrew, Scotland. Apparatus for molding and refining sugar	401,612	Apr. 16	1812	474	47	363
Walker, John. (See Richards and Walker.)						
Walker, John, Cleveland, Ohio. Traveling crane	401,613	Apr. 16	1815	474, 475	47	364
Walker, John, Cleveland, Ohio. Sheaf-supporting frame for cable railways	401,986	Apr. 23	2366	615	47	478
Walker, Joseph, near Manchester, Va. Gate	404,754	June 4	553	141	47	1334
Walker, William G., Black Oak, Mo. Car-coupling	405,287	June 18	1350	356	47	1505
Wall, Alexander B., assignor of one-half to F. P. Blount, Colchester, Ill. Elevator	404,808	June 4	635	163	47	1351
Wallace, Dwight O. (See Despain, Joseph H., assignor.)						
Wallace, Jacob B., assignor to G. M. Clark & Company, Chicago, Ill. Vapor-stove	403,568	May 21	1547	407, 408	47	972
Wallace, Martin B., Dalton, Ga. Washing-machine	405,930	June 25	2345	616	47	1704
Wallace, William, *et al.* (See Casey, Thomas A., assignor.)						
Wallace, William W., assignor to J. W. Penfield & Son, Willoughby, Ohio. Brick or tile cut-off machine	405,631	June 18	1877	496, 497	47	1612

Wallbank, Rovert. (See White and Wallbank.)						
Wallbridge, Heman D., *et al.* (See McCarty, William F. M., assignor.)						
Waller, Elijah F., Hanson, Ky., and O. A. Carlstedt, Evansville, Ind. Smoke and dust fender for car-windows	405,060	June 11	1009	269 / 270	47	1433
Wallwork, Roughsedge, and A. C. Wells, Manchester, county of Lancaster, England. Regenerative burner	404,063	May 28	2284	598	47	1124
Wallwork, Roughsedge, and A. C. Wells, Manchester, county of Lancaster, England. Regenerative burner	404,064	May 28	2288	599	47	1125
Wallwork, Roughsedge, and A. C. Wells, Manchester, county of Lancaster, England. Apparatus for supplying combustible liquids to burners	405,860	June 25	2230	567	47	1685
Walrath, Jesse, Racine, Wis. Wheel	403,861	May 21	1976	518	47	1056
Walsh, Edward, Jr., St. Louis, Mo. Charging apparatus for blast-furnaces	401,304	Apr. 16	1461	382	47	298
Walsh, Edward, Jr., St. Louis, Mo. Blast-furnace	401,305	Apr. 16	1462	382	47	299
Walsh, Edward, Jr., St. Louis, Mo. Indicating device for charging furnaces	401,521	Apr. 16	1649	433	47	333
Walsh, Edward, Jr., St. Louis, Mo. Condensing zinc vapors and collecting the metallic zinc therefrom	402,210	Apr. 30	2720	706	47	555
Walsh, Edward, Jr., St. Louis, Mo. Apparatus for condensing zinc vapors and collecting the metallic zinc therefrom	405,134	June 11	1101	293 / 294	47	1450
Walsh, John H., Boston, Mass. Composition for pipes	400,527	Apr. 2	149	.....	47	32
Walter, Frank, *et al.* (See Medden and Urquhart, assignors.)						
Walter, Henry E., Schenectady, N. Y. Dynamo-electric machine	403,158	May 14	999	237	47	841
Walter, Joseph, New York, N. Y. Speaking-tube	405,061	June 11	1010	270	47	1433
Walter, William, Philadelphia, Pa. Underground conduit	400,810	Apr. 2	576	150	47	110
Walter, William, assignor of one-fourth to S. A. Clements, Greensburg, Pa. Coupler for mining-cars	403,159	May 14	902	237	47	841
Walters, John F., *et al.* (See Price, George W., assignor.)						
Walters, William J., Prospect, N. Y. Buckle	405,514	June 18	1701	449	47	1577
Walther, Henry, Brooklyn, N. Y. Piano-stool	400,528	Apr. 2	150	38	47	32
Walton, Joseph H., Philadelphia, Pa. Apparatus for drawing effervescing fluids	405,135	June 11	1103	294	47	1450
Wansbrough, William H. (See Schock and Wansbrough.)						
Ward, Carlos J. (See Hotchkiss, Zeroy P., assignor.)						
Ward, Charles L., Cavendish, Vt. Car-door	404,755	June 4	554	141	47	1334
Ward, Enoch. (See Law and Howe, assignors.)						
Ward, John E. (See Sterle, William D., assignor.)						
Ward, John F., Jersey City, N. J. Ship's ram	403,806	May 21	1894	497	47	1041
Ward, John F., Jersey City, N. J. Apparatus for laying pipe	403,865	May 21	1977	518	47	1056
Ward, Randolph G., Baltimore, Md. Machine for scraping the pulp, &c., from fibrous plants	404,756	June 4	555	142	47	1335
Warde, George H., New York, N. Y., assignor to W. H. Johnstone, Philadelphia, Pa. Pilot or head for sectional rods for threading underground conduits	405,515	June 18	1702	450	47	1578
Ware, Edward M., assignor to I. D. Ware, Philadelphia, Pa. Rack attachment for bedsteads	402,211	Apr. 30	2722	706	47	555
Ware, I. D. (See Ware, Edward M., assignor.)						
Warner, De Ver H., Bridgeport, Conn. Corset-clasp	404,135	May 28	2397	629	47	1147
Warner, Ebenezer, Tomah, Wis. Wire-fence tightener	404,938	June 11	829	215	47	1395
Warner, George W., Freeport, Ill. Spring-hinge	405,931	June 25	2346	616	47	1704
Warner, Ira D., Bridgeport, Conn. Manufacture of dress-stiffeners	403,160	May 14	902	238	47	841
Warner, Ira D., Bridgeport, Conn. Corset-stiffener	403,161	May 14	904	238	47	841
Warner, Isaac M., Bethel, Mich. Vehicle hub and axle	405,932	June 25	2348	616	47	1704
Warner Manufacturing Company. (See Hance, William A., assignor.)						
Warren, Andrew. (See Crecelius, Louis J., assignor.)						
Warren, Charles H., Peterborough, N. H. Nut-lock	405,632	June 18	1678	497	47	1612
Warren, Edward, Ligonier, Ind. Thill for vehicles	403,497	May 14	1444	378	47	943
Warren, James P. (See Lyman and Warren.)						
Warren, John E., Cumberland Mills, assignor to Cumberland Manufacturing Company, Portland, Me. Filter	404,236	May 28	2562	664	47	1178
Warren, Marion, Rochester, N. Y. Safety-valve	402,702	May 7	219	57	47	705
Warren, Marion, Rochester, N. Y. Detachable pressure-gage	402,703	May 7	221	58	47	705
Warrington, Jesse, assignor to Nordyke & Marmon Company, Indianapolis, Ind. Bolting-reel	404,810	June 4	638	164	47	1351
Washburn, Nathan, Boston, Mass. Metallic mold	401,804	Apr. 23	2110	550	47	428
Washburn, Robert M., Burlington, Iowa. Game	403,012	May 7	664	175	47	789
Washburn, William E., Kansas City, Mo. Caster-frame for tubs, &c	404,022	May 28	2302	598	47	1108
Water Primary Battery Company. (See Pratt, Robert J., assignor.)						
Waterbury Buckle Company. (See Smith, Dwight L., assignor.)						
Waterhouse, Charles N., St. Louis, Mo. Torsion-spring for vehicles	402,729	May 7	335	93	47	729
Waterhouse, Gilbert A., Quincy, Mass. Animal-releasing device	401,914	Apr. 23	2264	589	47	458
Waterhouse, John, New York, N. Y. Railway-bumper	402,790	May 7	358	93	47	730
Waterman, John S., assignor to Brown & Sharpe Manufacturing Company, Providence, R. I. Machine for cutting gears	401,987	Apr. 23	2367	616	47	478
Waterous, Frederick L., South St. Paul, Minn. Boiler	400,529	Apr. 2	151	39	47	32
Watkins, Lemuel B., Washington, La. Mechanical power	404,136	May 28	2399	623	47	1148
Watkins, William D., El Dorado Springs, assignor of one-half to J. H. Lucas, Osceola, Mo. Hay rake and stacker	400,530	Apr. 2	152	39, 40	47	32
Watres, Effie J., Scranton, Pa. Bedclothes-fastener	403,807	May 21	1895	498	47	1041
Watrous, Henry N., *et al.* (See Pickett, Chauncy J., assignor.)						
Watson, Alexander, Brookline, Mass. Adjustable work-rest for benches	403,627	May 21	1625	430	47	988
Watson, Charles G., Piney Grove, Md. Hand-planter	403,633	June 18	1679	447	47	1612
Watson, Emma H., Elizabeth, N. J. Columnar closet	400,614	Apr. 2	266	73	47	56
Watson, Henry, Donald, British Columbia, Canada. Snow-shoe	403,516	June 18	1703	450	47	1578
Watson, Jeremiah M., Boston, Mass. Shank-stiffener	403,569	May 21	1548	408	47	972
Watson, William, Jr., Ilion, N. Y. Wardrobe-hook	403,231	May 14	1027	271	47	866
Watt, John, assignor to W. K. Dana, Saccarappa, Me. Slasher	404,939	June 11	830	215	47	1396
Watt, William R., Somerville, Tenn. End-gate for wagons	403,628	May 21	1627	430 / 431	47	988
Watt, William R., Somerville, Tenn. Wagon-bed	403,629	May 21	1628	431	47	988
Wattie, William, assignor to Knowles Loom Works, Worcester, Mass. Shedding mechanism for looms	403,080	May 7	777	205	47	809
Watts, Henry F., Sandusky, Ohio. Electric heating apparatus	400,978	Apr. 9	830	222	47	168
Way, Frank K., Dayton, and W. T. Parker, Springfield, Ohio. Toy	403,232	May 14	1028	271	47	866
Wragly, William G., Galion, Ohio. Folding clip-board	403,233	May 14	1029	271	47	866
Weatherburn, Robert, assignor to T. Hulburd, London, England. Metallic packing	403,808	May 21	1896	498	47	1042
Weathers, James, Indianapolis, Ind. Sash-holder	403,013	May 7	665	175	47	789
Webb, John G., Rye, N. Y. Ticket-holder	403,234	May 14	1030	272	47	866

Webster, Joseph W., Little Rock, S. C. Plow	401,615	Apr. 16	1818	473	47	365
Webster, William, Armley, Leeds, county of York, England. Overedge sewing-machine	402,497	Apr. 30	3161	818 / 819	47	637
Webster, William R., Philadelphia, Pa. Die for upsetting eye-bars	400,979	Apr. 9	831	222	47	168
Weck, Charles H. (See Meyer and Weck.)						
Weeber, William, Philadelphia, Pa. Brick-machine	403,235	May 14	1031	272 / 273 / 274	47	866
Weekes, John W., Fort Worth, Tex. Brick-truck	401,306	Apr. 16	1464	386 / 387	47	299
Weeks, Albert E. (See Ledue and Weeks.)						
Wegmann, Friedrich, Zurich, Switzerland. Hulling or grinding machine	405,810	June 25	2158	567 / 568	47	1670
Wegmann, Friedrich, Zurich, Switzerland. Grinding and scouring grain	405,811	June 25	2160	568	47	1671
Weichhart, John, San Francisco, Cal. Machine for forming sheet-metal lathing	401,592	Apr. 16	1650	435 / 436	47	333
Weichhart, John, San Francisco, Cal. Machine for forming sheet-metal lathing	401,593	Apr. 16	1652	436	47	334
Weidemeyer, John P., Ashland, Ky. Rivet-holding device	402,288	Apr. 30	2829	732	47	575
Weidlich, Emil. (See Box, William W., assignor.)						
Weightman, Mary, Newcastle-upon-Tyne, county of Northumberland, England. Bedstead	402,704	May 7	222	58	47	705
Weil & Livingston. (See Schnopp, Ernst, assignor.)						
Weiler, Charles, Philadelphia, Pa. Street-sweeping machine	401,232	Apr. 9	1212	323	47	238
Weir, Fredric C., and N. O. Goldsmith, assignors to Weir Frog Company, Cincinnati, Ohio. Cable and railway crossing	402,875	May 7	478	125	47	752
Weir Frog Company. (See Weir and Goldsmith, assignors.)						
Weir, James W., Princeton, Ind. Harrow attachment for land-rollers	400,616	Apr. 2	269	74	47	56
Weirich, Jules, Béziers, Hérault France. Separating precious metals from ores	404,328	May 28	2705	.....	47	1204
Weiss, Charles W., Brooklyn, N. Y. Sewing-machine	403,163	May 14	906	238 / 239	47	842
Weiss, Charles W., Brooklyn, assignor of one-half to C. Kruse, New York, N. Y. Feed mechanism for sewing-machines	405,448	June 18	1501	420	47	1554
Weissbrod, Emil, Greenfield, Mass. Pocket or note book	404,758	June 4	559	143	47	1336
Welch, Alonzo T. (See Lawson, Samuel, assignor.)						
Welch, James E., assignor of one-third to D. Fisher and T. W. McNeely, Petersburg, Ill. Bolting-reel	405,973	June 25	2417	633	47	1716
Welch, James F., assignor to Glen Cove Machine Company, (limited,) Brooklyn, N. Y. Planing-machine	404,138	May 28	2401	629 / 630	47	1148
Welch, James F., Brooklyn, and E. F. Antenrieth, New York, assignors to Glen Cove Machine Company, (limited,) Green Point, Brooklyn, N. Y. Feeding device for planing-machines	401,524	Apr. 16	1654	436 / 437	47	324
Welch, Michael L., assignor of one-half to J. L. Studstill, Adel, Ga. Saw sharpener and gummer	404,329	May 28	2707	702	47	1204
Welch, Michael L., Valdosta, assignor of one-half to J. J. McDonough, Savannah, Ga. Valve-gear	404,453	June 4	118	28	47	1248
Welch, Rosia W., assignor of one-half to J. M. Knight, Baltimore, Md. Grain-clipping machine	401,607	Apr. 16	1801	493	47	377
Welch, Rosia W., assignor of three-fourths to W. T. Bromwell and J. S. Taylor, Jr., Baltimore, Md. Wheat-cleaning machine	405,268	June 18	1350	356	47	1505
Weld, George A., Winchester, Mass. Shoe-clasp	404,023	May 28	2203	579	47	1108
Weldon's Chlorine Processes Company. (See Pechiney, Alfred R., assignor.)						
Welles, Fred A., Milwaukee, Wis. Calipers or dividers	402,876	May 7	479	125	47	752
Welles, Howard W., assignor of one-half to J. G. Collingwood, Poughkeepsie, N. Y. Medicine-spoon register	400,719	Apr. 2	424	115	47	84
Wellington, Henry, Brooklyn, N. Y. Torch	401,805	Apr. 23	2111	550	47	428
Wells, Arthur C. (See Wallwork and Wells.)						
Wells, Frank A., Allegheny, Pa. Combined supply, overflow, and waste fittings for slop-sinks, basins, and baths	405,933	June 25	2349	616 / 617	47	1704
Wells, John T., Scottsville, N. Y. Truss for buildings or bridges	401,870	Apr. 23	2191	573	47	445
Wells, William H., Evershot, county of Dorset, England. Device for raising cream from milk	405,975	June 25	2420	634	47	1716
Welsbach Incandescent Gas Light Company. (See Bell, Harold J., assignor.)						
Welsbach Incandescent Gas Light Company. (See Von Welsbach, Carl A., assignor.)						
Welsh, Hamilton E., Harrisburg, Pa. Foot-stove	403,014	May 7	666	175	47	789
Welsh, Morries, Quincy, Mass., assignor to Union Metallic Fastening Company, of New Jersey. Boot or shoe nailing machine	403,081	May 7	778	206	47	809
Wemple, George W., assignor of nine-twentieths to B. W. Child, Boston, Mass. Device for removing calks from horseshoes	400,531	Apr. 2	154	40	47	33
Wendell, Menzo E., Troy, and T. S. Wiles, Albany, N. Y. Dampening-machine	401,770	Apr. 23	2045	535	47	417
Wenigmann, Ernest, New York, N. Y. Railway-car	401,525	Apr. 16	1655	437	47	334
Wenstran, Swan P. (See Blood and Wenstran.)						
Werner, Louis C. (See Kenney, Patrick L., assignor.)						
Werner, Joseph, assignor to A. Dzondi, Dresden, Saxony, Germany. Clock-pendulum	404,997	June 11	916	242	47	1413
Wesley, John L., Portland, Me. Corn and silk separator	405,634	June 18	1682	497	47	1612
Wessell, Charles E., *et al.* (See Medden and Urquhart, assignors.)						
Wessell, Nickel & Gross. (See Handing, Siegfried, assignor.)						
Wesselmann, Bruno, Hamburg, Germany. Vending apparatus	403,015	May 7	667	176	47	789

Westman, Gustaf M., New York, N. Y. Zinc-furnace	401,088	Apr. 9	987	263	47	196
Weston, Edward, Newark, N. J. Standard tangent-galvanometer	400,980	Apr. 9	832	221	47	168
Weston, Edward, Newark, N. J. Electrical measuring-instrument	403,311	May 14	1153	307	47	889
Weston, Edward, Newark, N. J. Portable tangent galvanometer	403,312	May 14	1154	307	47	889
Weston, Edward, Newark, N. J., assignor to United States Electric Lighting Company, New York, N. Y. Dynamo or magneto electric machine	401,317	Apr. 9	1334	335	47	263
Weston, Edward, Newark, N. J., assignor to United States Electric Lighting Company, New York, N. Y. Dynamo-electric machine	401,318	Apr. 9	1336	336	47	263
Weston, Edward, Newark, N. J., assignor to United States Electric Lighting Company, New York, N. Y. Dynamo-electric machine	401,668	Apr. 16	1892	493	47	377
Weston, Edward, Newark, N. J., assignor to United States Electric Lighting Company, New York, N. Y. Dynamo-electric machine	401,669	Apr. 16	1893	493	47	377
Weston, Frank A. (See Trost and Weston.)						
Weston, Rowland, East Saginaw, Mich. Water-closet	405,635	June 18	1883	499	47	1613
Weston, Thomas A., assignor to Yale & Towne Manufacturing Company, Stamford, Conn. Hoisting mechanism	402,878	May 7	481	120	47	753
Wetherbee, Leslie, Clayton, Mich. Wagon-brake	405,062	June 11	1011	270	47	1433
Wetherell, George F., and R. B. Jones, assignors of one-third to R. Richards, Chicago, Ill. Wood-planing machine	401,397	Apr. 16	1465	387	47	299
Wetzel, Michael, Sidney, Nebr. Compressed-air water-elevator	404,330	May 28	2709	703	47	1204
Wex, Henry, *et al.* (See McFarlane, John, assignor.)						
Weyand, Charles E., assignor to A. G. Jennings & Sons, Brooklyn, N. Y. Glove-embroidering attachment for sewing-machines	402,213	Apr. 30	2724	707	47	555
Wharry, James A. (See Rogers and Wharry.)						
Wheat, Franklin H., Lowell, assignor to G. Draper & Sons, Hopedale, Mass. Support for spinning-spindles	401,988	Apr. 23	2369	616	47	478
Wheat, Vanburen, Orleans, N. Y. Fruit-box	404,880	June 11	747	190	47	1379
Wheatley, John B., Detroit, Mich., assignor to A. Heine, Silver Creek, N. Y. Feed-regulator	400,720	Apr. 2	425	115	47	84
Wheeler, Edward W., assignor to A. L. Singer & Co., Chicago, Ill. Shirt-waist	400,721	Apr. 2	426	115	47	84
Wheeler, Frank, Meriden, Conn. System of electric locomotion	401,616	Apr. 16	1820	476	47	365
Wheeler, Roscoe B., Detroit, Mich. Garment-stay	403,809	May 21	1897	498	47	1042
Wheeler, Schuyler S., New York, N. Y. Automatic governor for electric motors or dynamo-electric machines	403,017	May 7	669	176 / 177	47	790
Wheeler, Schuyler S., New York, N. Y. Field-magnet for dynamos	403,018	May 7	673	177 / 178	47	790
Wheeler, Seth, Albany, N. Y. Toilet or wrapping paper roll	401,233	Apr. 9	1213	323	47	238
Wheeler, Seth, Albany, N. Y. Making perforations in paper	404,581	June 4	327	78, 79	47	1287
Wheeler, Seth, Albany, N. Y. Machine for making perforations in paper	404,582	June 4	329	79	47	1287
Wheeler, Seth, Albany, N. Y. Bosom-pad	404,881	June 11	748	191	47	1379
Wheeler & Wilson Manufacturing Company. (See Dial, Steward, and Dimond, assignors.)						
Wheeler & Wilson Manufacturing Company. (See Ostrom and Boynton, assignors.)						
Whelan, Timothy P. (See Hobbs and Whelan.)						
Whem, Joseph R., Denver, Colo. Sash-fastener	403,810	May 21	1898	498	47	1042
Whiddon, Isaac L., and J. S. Bashaw, Chipley, Fla. Car-coupling	400,617	Apr. 2	270	74	47	56
Whipp, Frank D., Cleveland, Ohio. Vibrating propeller	405,813	June 25	2164	569	47	1671
Whipple, Charles A., Galesburg, Ill. Store-service apparatus	404,882	June 11	749	191	47	1379
Whipple, Frank B., Erie, Pa. Paper-weight	402,048	Apr. 23	2469	644	47	496
Whisman, Isaac, Stover's Shops, Va. Railway-gate	405,814	June 25	2165	569	47	1672
Whitall, Tatum & Co. (See Atwater and Herckner, assignors.)						
Whitall, Tatum & Co. (See Tatum, Charles A., assignor.)						
White, Albert, assignor to J. L. Pinder, Lowell, Mass. Spring-hanger	401,398	Apr. 16	1467	387	47	300
White, Allert A., Vassar, Mich. Animal-shears	401,806	Apr. 23	2112	551	47	428
White, Anthony C., Boston, Mass. Electrical measurement apparatus	401,617	Apr. 16	1821	476	47	365
White, David S., Minneapolis, Minn. Hoisting and loading machine	401,618	Apr. 16	1826	476	47	365
White Dental Manufacturing Company, S. S. (See Casey and Browne, assignors.)						
White Dental Manufacturing Company, S. S. (See Gilbert, John W., assignor.)						
White, Fred H. (See Heath and White.)						
White, Hawley C., North Bennington, Vt. Stereoscope	401,807	Apr. 23	2113	551	47	428

Alphabetical list of patentees, April to June, inclusive—Continued.

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drg.	Official Gazette. Vol.	Official Gazette. Page.
White, James C., Sewickley, Pa. Electrical railway-signal	405,815	June 25	2167	570	47	1672
White, John C., Swatara, Pa. Anchoring device for portable machines	403,811	May 21	1899	499	47	1042
White, John S., Cleveland, Ohio. Former for restoring bent wick-tubes	401,234	Apr. 9	1214	323	47	239
White, John S., Portland, Me. Window-screen	404,454	June 4	120	29	47	1248
White, Maurice W., assignor of one-half to G. W. Ross, Boston, Mass. Tail-piece fastener for violins	402,118	Apr. 23	2584	660	47	519
White, Maurice W., assignor of one-half to G. W. Ross, Boston, Mass. Peg for violins	405,816	June 25	2168	570	47	1672
White, Rollin, Lowell, assignor to W. F. Draper, Hopedale, Mass. Support for spinning-spindles	405,233	June 11	1961	334	47	1481
White, William A., Stantsburg, N. Y. Water-heater	402,499	Apr. 30	3163	820	47	637
White, William G. (See Boyd, John, assignor.)						
White, William P., Cincinnati, Ohio. Carpet-cleaner	403,313	May 14	1157	308	47	890
White, William P., Manchester, and R. Wallbank, Bolton-le-Moors, county of Lancaster, assignors to J. H. Heap, Accrington, England. Promoting combustion in furnaces	405,817	June 25	2169	570	47	1672
White, William R., Neoga, Ill. Gate	403,975	May 28	2137	559	47	1095
Whitehead, William R. (See Lawton, Swann, and Whitehead.)						
Whitehill, David B., North Clarendon, Pa. Gage-cock	402,373	Apr. 30	2959	767	47	599
Whiteley Company, William N. (See Whiteley, William N., assignor.)						
Whiteley, William N., assignor to W. N. Whiteley Company, Springfield, Ohio. Making chain-links	402,637	May 7	125	30	47	688
Whitelock, John W., Roanoke, Va. Veterinary syringe	405,137	June 11	1105	294	47	1451
Whittemore, William A., Hartman, Ark. Combined show and shot case	402,119	Apr. 23	2585	670	47	519
Whitford, John C., Stockton, Cal. Driving-gearing	400,981	Apr. 9	836	224	47	169
Whiting, William S., assignor to C. F. Trott, Waterbury, Conn. Smoker's set	404,665	June 4	437	109 / 110	47	1310
Whitlock, Edward. (See Streat, Thomas, assignor.)						
Whitlock, Ephraim J., assignor of two-thirds to L. E. Byrnes and J. Thake, Brooklyn, N. Y. Water-seal overflow-trap	404,759	June 4	560	143	47	1336
Whitmore, Daniel, Bellevue, Iowa. Offset mechanism for saw-mill carriages	402,706	May 7	224	59	47	706
Whitmore, William H., Cleveland, Ohio. Ratchet-wrench	400,722	Apr. 2	427	116	47	85
Whitner, William C., Rock Hill, S. C. Suspension fly-fan	401,526	Apr. 16	1656	437 / 438	47	335
Whitney, Amos, assignor to Pratt & Whitney Company, Hartford, Conn. Milling-cutter	404,940	June 11	831	215	47	1396
Whitney Coupling Company. (See Whitney, Daniel D., assignor.)						
Whitney, Daniel D., Cornwall, N. Y., assignor to Whitney Coupling Company, Whitinsville, Mass. Whiffletree-connection	404,371	May 28	2770	718	47	1217
Whitney, Edwin R., St. Johnsbury, Vt. Cut-out for incandescent electric lamps	401,527	Apr. 16	1657	438	47	335
Whitney, Harry O., assignor to Winchester Repeating Arms Company, New Haven, Conn. Machine for rolling paper tubes	405,138	June 11	1106	295	47	1451
Whitney, Orison C., Cleveland, Ohio. Organ	401,474	Apr. 16	1592	418	47	321
Whittier, Joseph G., and W. E. E. Herron, Attica, Ind. Shoe-fastening	401,808	Apr. 23	2115	551	47	429
Whittlesey, Charles E., New Haven, assignor of one-half to C. Lee, Bridgeport, Conn. Oscillating chair	401,089	Apr. 9	990	264	47	196
Wiant, David A., New Bethlehem, Pa. Clock-frame	403,812	May 21	1900	499	57	1042
Wiard, Gilbert L. (See Hooton and Wiard.)						
Wiard, Harry, Syracuse, N. Y. Spring-toothed harrow	403,976	May 28	2139	559	47	1096
Wiard, Harry, and J. L. Judd, Syracuse, N. Y. Horse hay-fork	403,019	May 7	675	178	47	791
Wichelhaus, Friedrick, Newark, N. J., assignor to Bailey, Farrell & Co., Pittsburg, Pa. Cartridge-crimping tool	404,811	June 4	639	164	47	1352
Wickears, Barney C. (See Wickers and Wickears.)						
Wickers, George O., Lawrence, assignor to Davis & Furber Machine Company, North Andover, Mass. Cylinder for carding or other machines	404,812	June 4	640	165	47	1352
Wickers, George O., Lawrence, assignor to Davis & Furber Machine Company, North Andover, Mass. Cylinder for carding-machines, &c.	405,234	June 11	1262	335	47	1481
Wickers, Lewis F., and B. C. Wickears, Lebanon, Ind. Fence	403,977	May 28	2140	559	47	1096
Wickham, Thomas, Hub City, Wis. Device for catching animals	404,563	June 4	331	79	47	1288
Wicks, Joseph, assignor of two-thirds to G. H. and W. C. Hughes, Utica, N. Y. Cistern-valve for water-closets	400,982	Apr. 9	837	224	47	170
Widdicombe, Robert H., assignor to Western Electric Company, Chicago, Ill. Electric-cable terminal	404,813	June 4	640	165	47	1352
Wiechert, Charles A., deceased, (L. F. Wiechert administratrix,) and R. Gabrielsky, Brooklyn, N. Y. Machine for making vials	401,670	Apr. 16	1894	493 / 494	47	377
Wiechert, Lizzie F., administratrix. (See Wiechert and Gabrielsky.)						
Wiegand, Edwin B. (See Chantrell, John, assignor.)						
Wiegand, S. Lloyd, Philadelphia, Pa. Heating gas-burner	405,139	June 11	1110	295	47	1451
Wiesendanger, John K., and J. Ulrich, La Crosse, Wis. Screen and storm-door	404,999	June 11	918	242	47	1413
Wiest, John, York, Pa. Hoist	403,164	May 14	908	239	47	842
Wiggin, George B. (See Bartlett and Wiggin.)						
Wiggin, George B., South Newmarket, and J. Bartlett, Epping, N. H., assignors of one-half to J. W. Hoard, Providence, R. I. Channeled shoe-sole	401,235	Apr. 9	1215	324	47	239
Wiggin, George B., South New Market, and J. Bartlett, Epping, N. H., assignors of one-half to J. W. Hoard, Providence, R. I. Shoe-sole-channeling machine	403,813	May 21	1901	499	47	1043
Wightman, Merle J. (See Lemp and Wightman.)						
Wilbur, Alfred, Allegheny, assignor of one-half to B. H. Lightfoot, Pittsburg, Pa. Filter	400,884	Apr. 2	682	186	47	131
Wilcomb, Frank, Providence, R. I. Straight-knitting machine	405,639	June 18	1908	503	47	1617
Wilcomb, Frank, Providence, R. I. Straight-knitting machine	405,640	June 18	1911	503 / 504	47	1617
Wilcomb, Frank, Providence, R. I., assignor to Wilcomb Manufacturing Company, San Francisco, Cal. Straight-knitting machine	405,636	June 18	1885	498	47	1613
Wilcomb, Frank, Providence, R. I., assignor to Wilcomb Manufacturing Company, San Francisco, Cal. Straight-knitting machine	405,637	June 18	1887	499	47	1613
Wilcomb, Frank, Providence, R. I., assignor to Wilcomb Manufacturing Company, San Francisco, Cal. Straight-knitting machine	405,638	June 18	1889	499 / 500 / 501 / 502	47	1614
Wilcomb Manufacturing Company. (See Wilcomb, Frank, assignor.)						
Wilcox, Charles F., Ipswich, Mass. Thread-cutting mechanism for sewing-machines	401,399	Apr. 16	1468	387	47	300
Wilcox, Ralph, Milwaukee, Wis. Feeder for roller-mills	402,049	Apr. 23	2470	644	47	497
Wilcox, Stephen, Brooklyn, N. Y. Gas or air engine	402,540	Apr. 30	3235	839 / 840	47	652
Wilcox, William and W. A., Jr., Grand Rapids, Mich. Automatic supply-valve for evaporators	405,449	June 18	1592	420	47	1555
Wilcox, William A., Jr. (See Wilcox, William and W. A., Jr.)						
Wild, William H., Valatie, N. Y. Intermittent-grip device	405,140	June 11	1110	296	47	1451

Name, residence, and invention.	No.	Date.	Monthly volume. Spec.	Monthly volume. Drgs.	Official Gazette. Vol.	Official Gazette. Page.
Wilder, Charles H., Natick, Mass. Molding material	404,238	May 28	2569	.....	47	1179
Wilder, Charles H., Natick, Mass., assignor to F. E. Atteaux, trustee. Core for casting ordnance	404,239	May 28	2570	669	47	1179
Wilder, Charles H., Natick, assignor, by mesne assignments, to F. E. Atteaux, trustee, Boston, Mass. Mold	404,372	May 28	2771	719	47	1218
Wilder, Charles W., Fitchburg, assignor to T. C. Entwistle, Lowell, and W. H. Rankin, Lawrence, Mass. Lubricator for loose pulleys	400,885	Apr. 2	683	186	47	131
Wilder, James R., *et al.* (See Purdy and Sadgwar, assignors.)						
Wile, Sol. (See La Casse, Henry, assignor.)						
Wiles, Thomas S. (See Wendell and Wiles.)						
Wiles, Thomas S., Albany, N. Y. Photographic-plate-developing tray	402,214	Apr. 30	2726	707	47	556
Wilhelm, Henry, Oneida Mills, assignor of one-half to B. Smith, near Minerva, Ohio. Grain-scourer	403,090	May 7	676	178	47	791
Wilkening, Gottlieb, Dayton, Ohio. Musical game-wheel	404,140	May 28	2405	631	47	1149
Wilkes-Barré Self Closing Hydrant Company. (See Dowling, John, assignor.)						
Wilkes, Peter, Trenton, N. J. Pottery-jigger	404,941	June 11	832	216	47	1396
Wilkeson, W. W., *et al.* (See Griffin, Theophilus, assignor.)						
Wilkins, Alexander G., Meadville, Pa. Lawn-mower	405,753	June 25	2089	548	47	1657
Wilkins, George H., Shelburne Falls, Mass. Spool of thread for sewing-machines	405,726	June 25	2048	538	47	1648
Wilkins, James S., Jr., Keene, N. H. Toy railway-car	403,165	May 14	910	239	47	842
Wilkinson, Arthur J. (See Naysmith, Robert, assignor.)						
Wilkinson, Thomas P., Milford, Mass. Machine for molding hats	401,809	Apr. 23	2116	551	47	429
Willbrandt, Emil, Indianapolis, Ind. Surgical-needle case	402,550	Apr. 30	3239	840	47	652
Willcox, Oliver, Brooklyn, assignor of one-half to R. A. Chesebrough, New York, N. Y. Bottle-washing machine	404,141	May 28	2406	631	47	1149
Willey, John H., Manchester, N. H. Whiffletree	402,638	May 7	126	30	47	688
Williams, Alfred, Philadelphia, Pa. Hot-air furnace	400,886	Apr. 2	684	186, 187	47	131
Williams, Charles R., Newark, N. Y. Step-ladder	402,215	Apr. 30	2727	707	47	556
Williams Company, John R. (See Williams, John R., assignor.)						
Williams, Edward T., Carrollton, Ky. Grinding-mill	400,583	Apr. 2	157	41	47	33
Williams, Herbert F., Brooklyn, N. Y. Vaporizer	404,240	May 28	2570	670	47	1179
Williams, Horace, J. L. and L. R. Alberger, Buffalo, N. Y. Apparatus for the manufacture of salt	400,983	Apr. 9	838	224, 225	47	170
Williams, John, Jersey City, N. J., E. J. Frost and W. Dawson, Philadelphia, Pa. Lamp fixture and ventilator for railway-cars	400,984	Apr. 9	842	225, 226	47	170
Williams, John A., Kansas City, Mo. Vending apparatus	402,374	Apr. 30	2960	768	47	599
Williams, John F., Grand Forks, Dak. Ter. Harrow attachment for plows	404,142	May 28	2408	631	47	1150
Williams, John H. (See Lewis, Williams, and Matthews.)						
Williams, John H., Waterloo, Iowa. Door-spring	401,319	Apr. 9	1337	356	47	263
Williams, John H., Urbana, Ohio. Valve for engines	401,400	Apr. 16	1469	388	47	300
Williams, John H., Urbana, Ohio. Steam-valve	405,641	June 18	1914	504	47	1618
Williams, John R., Boston, Mass., assignor to Boston Feed Basket Company, of New Hampshire. Feed-bag	403,867	May 21	1980	520	47	1057
Williams, John R., Newark, N. J., assignor to J. R. Williams Company, New York, N. Y. Cigar-bunching machine	401,090	Apr. 9	992	264, 265	47	197
Williams, John T., Mount Vernon, assignor to International Portelectric Company, New York, N. Y. Electro-magnetic transmitter	405,194	June 11	1205	320	47	1470
Williams, Louis N. D. (See Scott and Williams.)						
Williams, Malcolm B., Kalamazoo, Mich. Harrow-tooth holder	404,024	May 28	2504	679	47	1108
Williams, Nathaniel B., Bridgeport, Conn. Corset-fastening	403,166	May 14	911	239	47	843
Williams, Percy G., and A. W. Roovers, Brooklyn, N. Y.; said Roovers assignor to said Williams. Coin-released spirometer	403,978	May 28	2141	560	47	1096
Williams, Robert S., Merchantville, N. J. Device for agitating liquids	401,724	Apr. 16	1976	517	47	393
Williams, Thomas H. (See Tompkins and Williams.)						
Williams, Thomas H., *et al.* (See Matlock, John N., assignor.)						
Williams, Virgil L., Cartersville, Ga. Baling-press	403,498	May 14	1444	378, 379	47	943
Williams, Wilbur M., Holden, Mo. Check-row corn-planter	404,025	May 28	2205	579	47	1106
Williams & Wright. (See Wright, Walter B., assignor.)						
Williamson, Alfred, Concord, N. H. Ticket and stamp holder	404,584	June 4	333	80	47	1288
Williamson, John. (See Doyle and Williamson.)						
Williamson, John J., Boston, Mass. Money-order blank	403,499	May 14	1446	379	47	944
Williamson, W. Irving, *et al.* (See Railsback, Lafayette D., assignor.)						
Williamson, William A., Newark, N. J. Sash-lift	404,666	June 4	439	110	47	1310
Williamson, William A., Newark, N. J. Corkscrew	405,385	June 18	1488	395	47	1533
Willis, Don F., assignor of one-half to J. M. and J. S. Griffin, Lynn, Mass. Lasting boots and shoes	404,455	June 4	121	29	47	1248
